THEIR ORIGIN, VALUE AND USE—COMMENT AND VIEWS ON AN IMPORTANT BRANCH OF THE TRADE.

## A New Substitution for Black Walnut

A correspondent of an English trade paper advocates the substitution of mahogany gunstocks for black walnut, on the ground that the former is cheaper and is as good, says Hardwood Record. At present the gunstock problem is pretty serious in England, and the correspondent criticizes the government for sticking to walnut merely because it has long been the custom to equip guns with walnut stocks.

The fact is, the employment of walnut is not a matter of fashion but is due to qualities which make it extremely serviceable. Mahogany is an excellent wood, and probably its principal drawback when made into gunstocks is its weight and low elasticity. It is about seven pounds per cubic foot heavier than black walnut; but to compensate for excessive weight, it is about forty per cent. stronger than walnut. Taking advantage of its greater strength, smaller stocks might be made to answer, and by doing this, a mahogany gunstock should be no heavier than one of walnut.

Weight and strength are only two of the factors entering into the gunstock question. The principal one is the elasticity of the wood, and it is here that, weight for weight, black walnut is unquestionably superior to mahogany. Elasticity is important in taking up the jolt caused by the discharge of the gun, and it saves the soldier's shoulder. That may not be of as great importance with the modern military rifle as with the old-fashioned musket whose "kick" was stunning; but the recoil of the modern rifle needs an elastic stock to take up the shock. Mahogany will do it fairly well, but not well enough to justify its substitution for walnut. Weight for weight, the elasticity of black walnut is twenty-five per cent. greater than that of American mahogany. It is probable that some of the African mahoganies would make a different showing. Some of them, particularly okume mahogany, are much lighter than black walnut, but figures to show their elasticity are not available.

The claim that Cuban or Santo Domingo mahogany is cheaper in the English market than American black walnut is surprising. It is generally supposed that walnut is from twenty to fifty dollars cheaper per thousand feet.

Aside from elasticity and weight, the comparison of walnut and mahogany does not show great differences in the qualities required in gunstock material. Both are of dark color and are not easily stained. They are not inclined to warp, check, shrink, or swell when they have been well seasoned. They take high polish and are handsome.

## The Meaning of "Solid"

A recent lawsuit in a county court in England turned upon the meaning of the word "solid" when applied to furniture. A customer, it is stated, ordered a solid mahogany bedroom suit and agreed to pay $61.75 upon delivery. He refused to accept the furniture, claiming that all the wood in it was not mahogany, consequently it was not solid. When the case came to court the maker of the furniture admitted that some of the inside parts were not mahogany, but he insisted that the articles conformed in every way to what in trade is called solid mahogany. The court's decision agreed with him.

Custom rules. If in ordinary business it is usual to apply a certain name to an article of a particular kind, the article may be legally sold under that name, without conforming to exact definitions.

The manufacturers of articles of mahogany and other expensive woods in the United States, especially caskets, fixtures, and fine furniture, frequently observe the letter as well as the spirit of the contract when they use the word solid. The cabinet-maker may be taken as an example. If a customer asks for a solid mahogany article, he is apt to get it; but that does not mean that all the wood is of as high class as that which appears on the outside. There are different grades of mahogany. The "sound wormy" is perforated with holes in large numbers and of various sizes, from a knitting needle to a lead pencil. This is the work of the teredo in tropical waters. Such wood is not suitable for outside work, but it is excellent for cores over which to glue veneers.

The hidden parts of the article may be of the perforated mahogany, and the covering consist of veneer of high grade. Cost is thus kept down, and yet the article contains no wood except mahogany. The same process may be followed when other woods are used. Solid articles may have fine figured stock outside, and plain and cheaper grades for the hidden parts.

Practically all good furniture, if the pieces are of large size, is built up. Table tops are of sheets of veneer glued upon cores of other woods. Solid pieces of that size would warp and check, but the built-up stock holds its shape. It is not customary to have cores of the same wood as the outer surface, yet that process is followed where the customer insists on solid wood. Massive table legs are occasionally made of expensive English oak, if the customer insists; but they are cheaper and better if a core of white pine, chestnut, or yellow poplar is within, and the covering only is of the expensive oak. If the customer objects to having a cheaper wood within, the maker has been known to build up the legs of the table with oak boards glued firmly together, and do the turning afterwards. That is done by the maker because a built-up piece is less liable to check than is the solid stock, and the customer gets the "solid" English oak table, legs and all.

It is evident that "solid" used in this sense does not mean that each part is one piece, but means only that the whole article is of one wood.—Hardwood Record.

## Encouraging Industrial Research

In an address recently delivered before the House of Commons, Mr. A. C. MacDonell, M. P. for South Toronto, made an interesting reference to the importance of industrial research, and although he made no definite mention of the Forest Products Laboraotries established by the Government two years ago in co-operation with McGill University, his remarks were such as to encourage the Government in the prosecution of this kind of work. "The idea is," Mr. MacDonell said, "to invoke the aid and assistance of our universities and great seats of learning and knowledge and to send out to the world practical, scientific men equipped with expert knowledge, to secure information in regard to manufacturing processes and to ascertain the location of markets, etc., with reference particularly to those products the supply of which hitherto has been in the hands of Germany, and which is now available to any one who may be able to capture it. There should be an established relationship between learning and industry. Laboratories of industrial research should be established at all great seats of learning and at our universities.

## Products from Douglas Fir

Tests of wood distillation at the University of Washington have proved that an average Douglas fir stump will yield from $13 to $16 worth of by-products. These tests have been made jointly by the Department of Industrial Chemistry at the University and the United States Forest Service under the supervision of Mark Darrin. Dr. H. K. Benson, head of the chemistry department reports as follows: A cord of wood will yield from $13 to $16, provided the products obtained from distillation can be disposed of at current market prices. The products are wood turpentine, wood tar, wood alcohol and charcoal. The turpentine market is not very active, but that for wood tar is rapidly becoming better, because of the inability of the American manufacturer to get coal tar. The charcoal market is dead, but I am confident that the establishment of a few industries on Puget Sound requiring charcoal would make profitable the industry of distilling fir stumps and mill waste.

## Burlington Route Buys B. C. Timbers

A report from Vancouver, B.C., states that orders have been placed by the Burlington Route, through the Forest Products Company, Limited, for 1,000,000 feet of rough lumber, which is said to be only a portion of a total requisition of 4,000,000 which is to be placed with British Columbia firms. The timber will be used by the railway for bridge construction and for roundhouses and terminal buildings. The Burlington Route, which is one of the largest of the transportation companies operating in the middle Western States, has been in touch with British Columbia timber interests for some time, following representations made on behalf of provincial industries. During the past eighteen months the Burlington Route has placed orders with Washington mills for 200,000,000 feet of lumber. The company's purchasing department now has requisitions on hand for 29,000,000 feet, it is reported. The Burlington Route in purchasing British Columbia timber, is following an example set a short time ago by the Great Northern Railway which placed an order through the Forest Products Company for more than a million feet of dimension timber. Both the British and French Governments have asked British Columbia timber firms for quotations on different kinds of timber and it is understood that additional orders may be placed after the shipments of 4,000,000 ties have been despatched. The lumber order for the Burlington Route will be shipped over the G. N. R.

# Form Forest Products Federation

## Lumbermen Take First Steps in Placing Wood Publicity on a Modern Business-like Basis

One of the most interesting and important meetings of lumbermen ever held in the United States took place at Chicago recently, the object being to commence the work of the proposed Forest Products Federation. The attendance represented all sections of the country and every branch of the lumbering industry. The movement was fostered by the National Lumber Manufacturers' Association and was endorsed by all other lumber associations. The Forest Products Federation as formed will represent no particular wood, but will have for its object the exploitation of wood as a building material and the development of new sources of consumption for wood products. Mr. R. H. Downman, New Orleans, president of the National Lumber Manufacturers' Association, presided at the meeting. The secretary, Mr. E. A. Sterling, before presenting his report read a telegram from Mr. J. M. Allen, secretary of the Shingle Agency of British Columbia, stating that the shingle manufacturers of British Columbia are in sympathy and heartily endorse the movement to further the legitimate uses of wood, and will give the Federation their support. The secretary then read his formal report, outlining the situation which had led to the formation of the Forest Products Federation. His report was in part as follows:—

The Federation is original in its conception, being the result of a preliminary meeting called by the National Lumber Manufacturers' Association at the suggestion of manufacturers, wholesalers and retailers; its executive committee represents all branches of the industry; its programme is unique, in that it presents authoritatively by committee reports and individual speeches the modern conditions which govern the use of wood; while finally it creates an unprecedented opportunity to organize permanently and effectively for the development of demand and the education of consumers. If any further facts are necessary to emphasize the seriousness of the situation, they will be presented here; if there is any doubt as to the advisability of definite concerted action, this is the place to express your views; and if anything is to be done this is the time to do it.

Wood is not being used in anywhere near all of the places to which it is adapted, or by proper selection and treatment could be made suitable and safe. The "other fellow" is taking business away from you every day. Either you don't know how to sell your product and make people want it, or you don't care. You are not up to date. You don't know enough about your own product or the conditions under which it is used. What is worse, you don't make the consumer want wood, nor do you use the simple available means of creating and holding a market. What have you ever done to show the construction engineer and architect where wood is best; what do you know about building codes and their effect on lumber consumption; or where have you ever held your own against competition by manufacturers of other building materials?

This meeting is for your benefit and for your use. Preparations for it have extended over barely two months' time. Its financial support has been derived from voluntary contributions by lumber associations and a few individual companies. It is largely the result of the personal efforts of a few men. It was not to be expected that the smaller organizations could contribute financially, nor those far distant send delegates. All, however, were advised of the meeting and supplied with literature. In the last six weeks over 32,000 copies of publicity matfer were distributed in addition to the general correspondence. Every comment has voiced a belief in the necessity and possibilities of the movement. If doubt exists it has not been expressed, unless it be in the silence of many who have not responded in any way. We can not escape the fact that there are those who do not sense a crisis in the lumber industry, who are sufficient unto themselves, or who believe the case is hopeless.

The more specific problems affecting the consumption of lumber today will be presented at the meeting. General information and details have been before you for months and years in the trade papers and through other sources of information. That there can be any question as to the existence of many factors, other than poor business conditions, which adversely affect the lumber business, hardly seems possible. If there is any doubt, however, that your failure systematically to promote the rightful use of wood is largely responsible for the depression in the industry and the crisis you are facing, just consider that:

Lumber consumption has fallen off in greater proportion than lumber building construction.

The lumber consumption has declined 50 board feet per capita, or 10 per cent. in the last eight years.

The city of Buenos Ayres is building 10,000 municipal houses. The materials used are confined to widely advertised products—cypress lumber and cement.

Substitutes for wood were 1/185 of all advertising in 1910, an increase of 618 per cent. over 1901.

Construction materials other than lumber are constantly being improved and perfected, and the consumer taught to use them effectively, thus permanently displacing wood, because the merits of wood are not presented and its uses and availability shown.

Powerful national organizations are working for the elimination of wood; while building ordinances conforming to these ends are being passed.

The lumbermen are using only 10 per cent. of the advertising space devoted to construction materials for maintaining the market they already have, while the manufacturers of other materials are using the other 90 per cent. in developing new markets. The effect is becoming evident, and the only reason there is still a lumber industry is that wood largely sells itself. As a construction material there is in value six times more lumber used than brick; nine times more than steel, and thirty times more than prepared roofings. Should these materials continue to get nine times as much publicity as wood?

A national agitation that "wood burns" is creating misunderstanding and misconception throughout the country, which is destroying confidence in the safety and utility of wood. That such propaganda is not based on fact is shown by statistics which prove that only a small percentage of fires are caused by the kind of building material. This is one of the most important single menaces to their business which the lumberman face.

The various associations of lumbermen have done something; a few of them have done much. These activities, however, are for particular woods or in limited regions. What we are meeting here for is to consider wood as such, to promote its use as a building material, and to organize for the good of the whole industry, from the timberland owner straight down the line to the ultimate consumer. The real big effective work to be done is outside the industry. Here is where demand originates and education counts. Sad but true is the fact that the lumbermen themselves must be educated, too; some to see the need of doing something; and some as to what they shall do. We are here at this meeting to do both. The opportunity is here and now, and if you go home without molding this temporary organization of the Forest Products Federation into a mighty power for creating demand and educating the consumer of lumber, the era of prosperity when it comes will not be for you."

A number of other exceptionally interesting and thorough reports were presented upon building codes, the lumber business, comparative prices of building materials, and a report upon an investigation of the agitation so widely spread throughout America under the slogan of "wood burns." Each of these reports bore definite evidence of the fact that the lumber industry was face to face with a determined campaign on the part of manufacturers of substitute building materials and that it was of the utmost importance to commence at once a vigorous and far-reaching campaign on the part of the lumber trade and industry in order to counteract the evil effects of this situation. The plan of the executive committee for permanent organization was presented and a committee to consider the plan and report upon it was appointed. This committee approved of the plan and amplified some of its detail. The organization is to be a department of the National Lumber Manufacturers' Association, but is to have a separate manager. The advisory committee is to consist of one retailer, one wholesaler, one timberland owner and three lumber manufacturers. This committee is to be created at once and have charge of financing the organization. It is proposed to raise $200,000 annually for five years. The work to commence when $50,000 a year for five years has been guaranteed.

---

An attractive calendar for the year 1915 has been sent out by James D. Lacey & Company, timber land factors, 1750 McCormick Building, Chicago, which will be very favorably received by those who are fortunate enough to obtain a copy. The calendar shows a beautiful scene in the woods of the Pacific Coast, where a group of loggers are seated among a number of Douglas firs. The picture is handsomely hand-painted, and mounted upon brown board with cream colored border.

---

## Personal Mention

Mr. Herbert W. Merrill, lumber merchant, Smith's Mills, has been appointed a magistrate for the district of St. Francis, P. Q.

Mr. E. T. Nesbitt, Quebec, P.Q., is taking a few weeks' holiday in Bermuda. The trip is undertaken in the nature of a rest-cure, Mr. Nesbitt not having been enjoying the best of health recently.

Mr. O. T. Swan, in charge of the office of Industrial Investigations of the Forest Service of the United States, has been elected secretary of the Northern Hemlock & Hardwood Manufacturers' Association.

Mr. Chas. E. Oak, of Bangor, Me., who is prominently identified with New Brunswick timberland interests, reports that about 90 per cent. of the usual cut of timber in New Brunswick will be taken out as the result of the present season's operations. Early in the season the estimate was generally placed at about 60 per cent., but recent developments have led to a considerable increase.

## Carborundum's Wonderful Utility

Machinery Building at the Panama-Pacific Exposition, which opened at San Francisco on February 20th, will house some wonderful exhibits and among them will be the exhibit of The Carborundum Company, Niagara Falls, N.Y. In arranging this exhibit, industrial education was the principal thought as the visitor to the carborundum exhibit will gain a wealth of knowledge regarding many of the varied manufacturing processes in which the abrasive products manufactured by this company play a most important part, the plan, in brief being to show in most cases the articles in the crude and in the finished state together with the carborundum products with which the work was done. From manufacturing plants all over the country, from plants in England, India, New Zealand, Australia and South American countries the exhibits have been gathered and the result is a wonderful collection of materials ranging from steel shafts to watch dials, from tooth picks to sections of flooring, from flour mill rolls to needles, beautiful examples of cut and engraved glass, sueded skins, polished and moulded marble onyx, semi-precious stones and pearl work in the grinding, shaping or finishing of which carborundum products have been used.

Such an exhibit tells the story of the great progress made possible in the grinding or abrasive field by carborundum products. It is claimed that there is scarcely a manufacturing process of any description in which grinding materials are not used in some form and the carborundum exhibit at the Panama-Pacific Exposition will add a chapter to the interesting history of the development of the modern abrasive.

A few years ago carborundum was created in a little iron bowl from a handful of coke and sand fused by the power generated by a tiny dynamo. The first of it sold for forty cents a karat, and it was, at that time, used only for the purpose of rough polishing diamonds and other precious stones, being used in place of the more expensive diamond dust. Now, a million pounds of crystal are made at the carborundum plant in a month in electric furnaces, using enough electric power in 36 hours to operate a sixteen candle-power lamp night and day for 220 years.

## An Interesting Barking Machine

The Moreau Barking Machine, manufactured by the Moreau Barking Machine Company, St. Hyacinthe, P.Q., and Drummondville, P.Q., is one of the most interesting machines in connection with the production of pulpwood that is to-day upon the market. Mr. Joseph Moreau, a laborer of St. Germain, P.Q., was earning 80c. a cord, some years ago, for peeling pulpwood with an ordinary sap knife and axe. He was only able to peel one cord a day. This amount of money did not enable him to live comfortably and he set to work upon the invention of a machine which would do the work more quickly. His first model was made with a pocket knife. For six years he kept on improving this wooden model, and when he considered that it was complete and efficient he had the first machine built at a foundry. This was sold to Mr. Brouillard, of Carmel, P.Q. It was given a year's test and then Mr. Moreau wen to work upon a new machine in which were incorporated a number of improvements. Three years later he had a new machine on the market, which was sold to the Lotbiniere Lumber Company and was used for barking pulpwood, in exactly the same place where, nine years previous, Mr. Moreau had been peeling wood by hand. After this Mr. Moreau devoted his attention to the production of a machine for peeling wood in winter as well as in summer. When this machine had been given a year's test, the rights for manufacturing were sold to the Moreau Barking Machine Company, Limited, who started to manufacture on a large scale. At first, the manufacturers met with a great deal of criticism and also with considerable difficulty on account of the failure of those with whom they contracted for the production of the machine, to put the right material in the cylinders. After changing their manufacturers, the company started again with new ideas and new improvements and put upon the market a much superior machine to the one which had already made its appearance. During that year, 53 machines were sold in Canada and the United States.

To-day, the Moreau barker is favorably known in many parts of Canada and the United States. Two hundred Moreau barkers are in actual use in Virginia, Georgia, South Carolina, Wisconsin, Michigan, Vermont, New Hampshire, Pennsylvania and every province in the Dominion of Canada. In actual use the machine has stood up to every requirement. Its efficiency has been thoroughly proved and the company is now receiving repeat orders. Since December, 1914, two factories have been producing Moreau barkers at the full capacity of their plants. The company are also completing arrangements to have another manufacturing plant established in Ontario. Twenty-five orders have been received from Ontario since December. Twelve machines were shipped during February to the district along the Temiskaming & Northern Ontario Railway.

The Moreau barker will bark any round stick from 3 ins. to 36 ins. in diameter, 36 ins. to 108 ins. long. It will take the sticks just as hardwood. It will operate in winter as well as in summer, and on they are fed to it, spruce, balsam, hemlock, pine, or any kind of frozen, wet green or dry wood, operating at 1,500 revolutions per minute. The machine will bark three cords of 128 cubic feet each, per hour, on wood averaging 6 ins. to 9 ins. in diameter. The first cylinder of the machine has three knives which are set like ordinary planer knives, according to the thickness that is to be taken off. These first knives are so fixed as to take off only knots and rough bark. The other cylinders have three slot knives, which are loose and can be adjusted to the log by the operator in the same manner as he would apply a chisel on a turning machine. This operation is done with a lever operated at the side of the barker by the man in charge. The slanting wheels, which roll the log, drive it over the knives. As the stick goes over the knives it is supported only on two wheels, 12 ins. apart. Both ends of the log are left free to roll. The operator in charge of the lever can lower or lift the knives, thus making it possible to take care of a crooked stick as easily as a straight one.

The feeding system is automatic and can be changed instantly by the lever, which is provided for that purpose. The more slant given to the feeding wheels, the faster the log will drive over the knives. As a small log will take less time to roll on itself, more speed is required and the reverse is the case with a large log. By holding the wheels it is thus possible to give the knives a chance to touch every part of the log. The knives are 8 ins. wide and cut the bark across the log instead of length ways. This involves less waste. Boiling the logs is done away with when the Moreau barker is used because it will work on any hard or frozen logs during the winter.

## The McLennan Foundry and Machine Works

The McLennan Foundry & Machine Works Limited, Campbellton, N.B., is one of the best known manufacturers of sawmill machinery in Eastern Canada, and its products are widely known throughout lumber manufacturing districts. The company has been established for 25 years, and specializes in sawmill machinery and general brass, iron and foundry work and mill supplies. Under the capable direction of Mr. Alex. McLennan, president of the company, it has made gratifying progress. Among the machines manufactured one of the most interesting is McLennan's gang edger No. 3, a machine with a capacity of 50,000 to 100,000 feet per ten hours. This machine occupies a floor space of 5 ft. 7½ in. x 8 ft. 8 in. The length of the feed rolls is 48 in.; diameter of spindle 3⅞ in.; diameter of driving pulley 14 in. x 14 in. The edger takes six 20 in. saws, two of these shifting saws. The front bench is furnished with iron rolls and the back bench with four iron rolls. The McLennan slab resaw is another interesting machine turned out by this company. It has a capacity of 15,000 to 25,000 feet in ten hours from slabs in 1, 2 and 3 in. It will take slabs 8½ in. thick. The machine occupies a floor space of 7 ft. x 9 ft. Its driving pulley is 16 in. x 14 in. It takes a saw 36 or 38 in., 10 gauge and operates at a speed of 1,200 r.p.m. Among the other machines manufactured by this company which are of interest to lumbermen are the McLennan improved shingle machine, which has a capacity of 17,000 to 22,000 pieces per ten hours, and occupies a floor space of 8 ft. x 8 ft.; and the McLennan sleeper machine, which has a capacity of 2,500 in ten hours and occupies a floor space of 12 ft. x 6 ft. This machine has a drive pulley 16 in. in diameter by 14 in. face and carries two 38 in. saws 8 gauge. The McLennan lath machine and bolter is also a widely known and very efficient machine manufactured by this company.

## Canadian Fairbanks-Morse Co. Now Handling Graton and Knight Belts

Arrangements have been made whereby the Canadian Fairbanks-Morse Company, Limited, will in future carry a large stock of all the well-known brands of belting made by the Graton & Knight Manufac-

turing Company, including their well-known Neptune, Waterproof, and Spartan Steamproof brands which are meeting with gratifying success in sawmills, planing mills and woodworking plants. The Neptune brand was introduced by the company in 1901 and they claim that it is the pioneer Waterproof leather belting. It has given splendid service wherever belting is required for use in damp and wet places. The Spartan brand of belting, as its name indicates, possesses great strength and durability. The leather used is tanned and finished by a special process ensuring exceptional pliability, which enables the belt to wrap the pulleys closely and transmit power with great economy. Spartan belting is rapidly coming into universal use on high speed drives with small pulleys, such as are found in abundance in woodworking plants, or for use where there is steam, oil, heat, water, chemical fumes, etc. The company back their Spartan belting by an iron-clad guarantee to the effect that it will withstand exposure to either hot or cold air, water, steam, heat generated by exposure to either hot or cold air, water, steam, heat generated by excessive pulley friction, or dry heat as high as 408 degrees. Under proper mechanical conditions it is guaranteed to transmit power with greater economy than any other material in use. If any belt should prove defective by reason of fault in material or workmanship, the company guarantee to furnish a new belt or repair the old belt without cost to the purchaser.

## Interesting Economical Manufacturing Methods

An exceptionally interesting sawmill installation has been made at Pellston, Mich., for Jackson & Tindle, of Buffalo, by the M. Garland Company, Bay City, Mich. The firm of Jackson & Tindle is also largely interested in Ontario, where they operate a modern sawmill. The plant at Pellston, Mich., is a double 8-in. band mill equipment with steel carriages equipped with 4-in. steam sets, 12-in. steam feeds, 8-in. and 10-in. niggers of special design, and 72-in. double six saw gang edgers. At the end of the edger tables under which the slasher chains run, the mill floor is dropped 2 ft. lower than the main floor, enabling the cut-off saw man to pull off on to the rolls all edgings and pieces that will make handles, squares, auto-wheel rims and other stock. The cut-off saw men then cut the stock into the required lengths and from there it goes to a gang rim machine, slab resaw or handle square machine. The handle stock drops into a conveyor to a handle mill 600 ft. away and the other special pieces are sorted and sent to the drying yard. All the edgings and slabs that are not the proper stock for this work are carried over the slasher from which they are picked out and made into lath, pulpwood, or stave wood; machinery for these purposes being all in a row. The refuse drops into a hog for boiler feed. The result of the installation of this complete equipment is that not a single piece of stock is wasted and everything is manufactured economically.

## Changes in John D. Mershon Lumber Company

The John D. Mershon Lumber Company, Saginaw, Mich., have recently made a change in their New York office. Mr. John D. Mershon's interest in the business has been bought out and he has retired from the company. The New York office is being continued at its old location No. 9076, 1 Madison Avenue, New York, where Mr. Harry J. Strong formerly of the Saginaw office is in charge. The company ask us to state that all mail should be addressed to the John D. Mershon Lumber Company at the above address. The John D. Mershon Lumber Company are the exclusive eastern representatives of the Pacific Lumber Company, whose mills are located at Scotia, California, and who claim to be the largest manufacturers of redwood in the world. Mr. John D. Mershon recently returned from attending the Retail Lumbermen's Convention at Cedar Rapids, Ia. He reports that the indications in that district are that there will be very good business this season. There was an enormous corn crop throughout Iowa and all retailers reported the usual amount of buildings under contemplation.

The North Western Pacific Railroad is now completed through to Scotia, Cal As soon as the rainy season is over all eastern shipments will be made direct from Scotia. The company report an increased interest in redwood in Canada during the last month. This is especially apparent because the demand dropped off entirely about the first of August last year.

## South African Firm Wants Large Quantities of Box Shooks

In a recent report to the Department of Trade and Commerce, Ottawa, reference is made to an enquiry from a firm in Natal, South Africa, which desires to obtain box shooks in large quantities from Canadian exporters. The quotations are to be on a basis of 15,000 to 20,000 per month, and samples are requested. The Department at Ottawa has received sample pieces to form a box 20½ in. long, 9½ in. wide and 7¾ in. deep. Readers of the Canada Lumberman who are interested in this enquiry, should write to R. Grigg, Commissioner of Commerce, Department of the Interior, Ottawa.

## B. C. Commencing Its Shipments to France

A Vancouver despatch states that the British Steamer Dunraven will shortly visit Vancouver to load the first shipment of an order recently placed by the British Government for 4,200,000 feet of railroad ties to be utilized for repairing damaged railroads and for constructing new lines in northwestern France. It is believed that this order is the forerunner of a number of additional orders of a similar nature. The Dunraven is expected to take out 3,000,000 feet. The remainder will be shipped by another vessel now en route for Vancouver. The material will be consigned direct to an un-named port in France. Part of this shipment is being supplied by the New Ladysmith Lumber Company, of Nanaimo, and eight or nine mainland firms are handling the bulk of the order.

## St. John Lumber Exports Show Increase

United States Consul Henry S. Culver, stationed at St. John, N.B., has advised the Bureau of Foreign and Domestic Commerce that notwithstanding the rapid advance in ocean freight rates exportations of lumber from St. John to the United Kingdom showed a remarkable increase in January this year over the corresponding month of the previous year. London and Liverpool seem to have developed a great demand for forest products, according to the report, London having imported more than 1,500,000 feet in excess of its imports for January, 1914, while Liverpool took 1,000,000 feet more. Concerning the lumber export trade from St. John, Consul Culver said:

A feature of the export lumber trade since the outbreak of war is the almost unprecedented high freights which have prevailed for steamers and sailing vessels, and chartering at more than 100s ($24.33) is now the rule, a remarkable jump from the rate in the same period last season, when 35s ($8.52) was considered high. A comparison of the shipments of wood from St. John to the United Kingdom. Australia, etc.:

**Spruce**

| | January, 1914 | January, 1915 |

## Hoo-Hoo Affairs Being Re-organized

An important joint meeting of the House of Ancients and the Supreme Nine of the Concatenated Order of Hoo-Hoo was held recently at Chicago for the purpose of considering the condition and the future of the order. The meeting was an enthusiastic one and it was unanimously resolved to go ahead with the great organization of lumbermen which now has an active membership of 13,000; and to take immediate steps to put it on a firm and substantial basis and to increase its usefulness. Supreme Snark E. D. Tennant, of Winnipeg, Man., and Supreme Gurdon Geo. H. Grayson, of Graysonia, Ark., are taking temporary charge of the executive offices of the order of St. Louis until such time as a new secretary or manager can be selected and installed. The late secretary, Mr. W. M. Stephenson, disappeared mysteriously from his office recently. He had been in poor health and the burdens of his office had apparently weighed greatly upon his mind. An examination of his affairs showed that everything in his office was in regular shape.

## B. C. Shipments to Australia Reviving

Neil Neilson, Trade Commissioner for New South Wales, whose headquarters are at San Francisco, recently visited Victoria, B.C., to arrange with the Provincial Government for the shipment to Australia of three lumber cargoes of 1,500,000 feet each. It is reported that more charters to load lumber out of Vancouver have been made than in any corresponding period during the last three years. The shingle manufacturing industry in particular is very active.

On Your Direct Drives

**SCANDINAVIA BELTING**

will give you good results at a low cost.

Scandinavia Double Belting is from 30% to 40% cheaper than double leather belting and will transmit the same power.

The lasting powers of this belt on drives of this nature are enormous. We have published a book on belting which gives a lot of information on this. It is free.

**FEDERAL ENGINEERING Co.**
LIMITED
TORONTO AND MONTREAL

In damp places where the ordinary kind of belting goes all to pieces, Neptune belting runs right along, day after day, every joint and every lap as tight as when first put on.

If you are interested in belting we'll send you samples of "Neptune" which you can soak in water. The laps will not loosen, nor, if double belting is used, will the belting come apart between the plies—this we guarantee.

*Write for Neptune Book and copy of our new text book "Belting Manual" Both sent gratis upon request.*

## Ontario

E. Woods & Son, Dalhousie Street, Amherstburg, Ont., is in the market for sawmill equipment and office fittings.

W. P. Ball, Welland, Ont., has commenced work upon the erection of a furniture factory 1½ storeys, 25 x 50 frame construction.

Albert McHardy, Canfield, Ont., has been awarded the contract for the supply of white oak planking required by the County of Haldimand.

The Thorold Pulp Company, Thorold, Ont., are razing the old pulp mill building which was destroyed by fire in January. They will erect a new mill.

Crown Furniture, Limited, has been incorporated with head office at Preston, Ont., and capital stock of $100,000, with power to manufacture, buy, deal in and sell all kinds of furniture.

W. C. Edwards & Company, Limited, Ottawa have been awarded the contract for the supply of lumber for the city of Ottawa for the current year. The value o the contract amounts to $10,565.

The Marshay Lumber Company, of which Mr. Duncan McLaren of the Union Lumber Company, Toronto, is president, was recently formed, and is operating in the township of Marshay on the C. N. R., about 60 miles north of Sudbury. The company is taking out about 70,000 pieces of red and white pine this year. The stock will be manufactured at Selwood Junction at the Wm. Milne plant. The company will have a stock both this season and next season. It will be about on-half red and one-half white pine.

The Beach Cheese Box Company, Limited, has been incorporated with head office at Morrisburg, Ont., and capital stock of $40,000. The incorporators include F. W. Beach, W. M. Beach. J. H. Hare, W. Alliston and A. Flynn, all of Morrisburg. The company are empowered to manufacture, buy, sell and deal in cheese boxes, apple barrels and boxes and packages of every kind manufactured from wood or partly from wood and partly metal, also to buy, lease, or otherwise acquire standing timber and sawmills and to operate same.

The Devon Lumber Company, whose sawmill at Devon, Ont., was completely destroyed by fire last fall, have closed a contract with the William Hamilton Company, Limited, of Peterborough, Ont., for the complete equipment of their new mill, to be built on the site of the old one. Besides the customary jack works, steam log deck machinery, and carriage, the mill will consist of an 8 ft. double cutting steam tension band mill, the very latest design Kendall gang circular to cut 8-in. cants, edger, slasher, trimmer and sorting table, lath machinery, and filing room outfit complete, together with a 20 x 24 Hamilton engine. A start has already been made on the mill framing, and it is expected that the plant will be in operation early in June.

## Eastern Canada

The Scotstown Sawmill Company, Scotstown, P.Q., has been dissolved.

G. Gagnon, general store and lumber dealer, Thurso, P.Q., has advertised his assets for sale.

The sash and door factory belonging to Walter Brown at Beebe, Que., was recently destroyed by fire.

E. Gingras has been registered to carry on business as a manufacturer of sash and doors, at Montreal, P.Q.

N. Achim & Company have been registered at St. Lambert, P.Q., to carry on business as coal and lumber dealers.

The Canadian Pulp Company, Sherbrooke, P.Q., has been registered, the members of the company being Wm. Brown and G. A. MacIver.

Chas. T. White & Son, Limited, Sussex, N.B., report that all the personal business interests belonging to their president, Chas. T. White will be continued and directed by Mr. Garfield White, as managing director and trustee.

Robinson Limited has been incorporated in New Brunswick with capital stock of $199,000, to carry on and operate a general lumber business in all its branches. The incorporators include James Robinson, Weldon Robinson and H. A. Frank, all of Millerton, N.B.

During the past year the Montreal Harbour Commissioners' sawmill was in operation 273 days. The quantity sawn during the season was 4,401,748 feet of hard and soft wood at an average cost of $2.95 per M. feet., B. M. The timber used during the year was as follows: 593,072 lineal feet, 1,952,119 feet B.M., 7,875 railway ties, 267 cords of slabs, 6 loads of slabs, hardwood, and 7 boat sides.

The Grand Valley Lumber Company, Limited, has been incorporated in Quebec province with head office at Montreal and capital stock of $75,000. The incorporators include W. R. L. Shanks, F. G. Bush, G. R. Drennan, M. J. O'Brien and H. W. Jackson, all of Montreal. The company is given power to manufacture, buy, sell and otherwise deal in logs, timber, lumber pulpwood, railway ties and forest products generally.

## Western Canada

A. H. Raymer, lumber dealer, Minto, Man., has sold out to the Home Lumber Yards Limited.

The N. J. Walker Lumber Company, Limited, Weyburn, Sask., has been succeeded by the McIlrath Lumber Company, Limited.

The Vancouver Shingle Mills, Limited, have been incorporated with head office at Vancouver, B.C., and capital stock of $10,000.

The Standard Shingle Mills, Limited, have been incorporated with head office at Vancouver, B.C., and a capital stock of $10,000.

The Forest Products Company, Limited, have leased Blackford's shingle mill at Burrard Bay, about five miles up Burrard Inlet, B.C.

The British Columbia Shingle Company, Limited, has been incorporated with head office at Vancouver, and capital stock of $100,000.

A. M. Robertson has leased the shingle plant of the Fernridge Lumber Company, Limited, at Aldergrove, B.C., and is operating it on a ten-hour schedule.

The Roberts & Winsod Sawmill near Elko, B.C., on the Crows Nest Pass Branch of the C. P. R. has been sold to Calgary parties who will operate it next spring.

The Builders' Wholesale Lumber Company, Limited, has been incorporated in British Columbia with head office at New Westminster and capital stock of $5,000.

The partnership between Messrs. Farber & Lapp under the name of the Fir Tree Lumber Company, Limited, Mount Lehman, Fraser Valley, BC., has been dissolved, Mr Lapp retiring.

The lumber yard, office and Automobile Sale Building, belonging to Grest Bros., at Watrous, Sask., were recently destroyed by fire. The loss amounted to $20,000, and there was insurance to the amount of $5,000.

The Weeks-Dunnell Lumber Company has started its new shingle mill at Fanny Bay, Vancouver Island. It is one of the best on the Island and is equipped for both rail and water trade. Four machines are in the plant, and it is planned to operate these double shift.

The Excelsior Lumber Company, Edmonton, Alta, has been organized and is opening yards on the E. D. and B. C. Railway at Swan River, High Prairie, McLennan, and Peace River Crossing. The head office of the company is at Edmonton. A. T. Cushing, of Cushing Bros., Limited, is manager, and J. Johnson, former manager of the lumber business of the Peace River Trading Company at Grouard, is yard manager for the new company.

Powers to carry on a general lumber business, including manufacturing in its varnious branches, have been given to the Grant Lumber and Fuel Company, of Winnipeg, in letters of patent which have just been issued. The company propose to take over as a going concern the lumber, logging, cordwood and manufacturing business operated on Lake Winnipeg by William Grant and John A. Grant, under the firm name of the Grant Lumber & Fuel Company. This enterprise will be paid for out of the capital stock of the company. The company's capital is given as $100,000, and the chief place of business is at Winnipeg.

A recent report from Vancouver stated that the large new shingle mill built by the Wasser-Mowat Shingle Company at Powell Lake, B.C., was to start operations early in March with seven machines. The output has already been contracted for in the Eastern States. It will be shipped by way of the Panama Canal. The company have 14,000 acres of timber at Powell Lake and intend to increase their plant to make it a 12 machine mill, giving them a capacity of 300,000 feet per day of ten hours. They have installed electric motors. Last fall the company reported that they did not intend to complete the mill until they found market conditions improving and they did not look for much improvement in the shingle business until after the war. It is significant therefore to note that the company are now commencing manufacturing operations.

---

Mr. George McDougall, secretary-treasurer of the Jacques Cartier Pulp and Paper Company, Montreal, died on March 6, aged 71 years. Mr. McDougall was formerly connected with the iron trade in Three Rivers, P. Q., but for the last twenty years resided in Montreal. He wore the Fenian Raid Medal, with two clasps, having seen service in both 1866 and 1870, under Col. John Grant, as a lieutenant of the 5th Royal Light Infantry, the corps from which sprang the Royal Highlanders.

---

The lumber business in the United States Middle West is showing marked improvement, and general business conditions are becoming better in the Eastern States, according to Mr. E. G. Flinn, a prominent lumberman of Minneapolis, who recently visited Vancouver, B.C. During the past two months, he reports, there has been a revival of trade activity, due to a large extent to the orders being placed by belligerent nations for goods and supplies manufactured in the States.

---

A report from Vancouver, B.C., states that about 25 per cent. of the mills in British Columbia are now operating, or rather that 25 per cent. of the possible production is being manufactured.

# The Steam Tension Band Mill

It is called the steam tension mill because the tension is maintained by steam—the most sensitive form of tensioning which has been devised.

The result of this is a great saving in saws—**several users of the machine have run through an entire season without cracking a single saw.**

But in addition to raising and lowering the top wheel by steam, there is a separate cylinder for operating the top guide, and these two cylinders make ours an entirely steam-operated mill, and, therefore, exceptionally fast.

It is made with 8 ft., 9 ft. and 10 ft. wheels, and will stand thorough investigation.

Write for bulletin and list of users.

## Duplicating Nature's Process

Case hardening is the result of lumber which is merely surface dried. The wood splits, cracks and demands only a low price on the market.

Sturtevant
(REG. CAN. PAT. OFF.)

## Common Sense Moist Air Dry Kiln

dries lumber from center to surface and under no circumstances is it possible for the kiln attendant to bake the lumber.

The Sturtevant Kiln duplicates nature's process and gives perfectly dry lumber.

Letters from actual users in all parts of the country enable us to offer you evidence as to how our Common Sense Kiln will do work similar to yours.

**Shall we send you bulletin 220-C?**

## "Wilson Bros." Hardwood Flooring

**is the Flooring that is manufactured expressly to supply the demand for the best. It is made by modern machinery from carefully selected stock, and every precaution is taken throughout our entire system to make it fulfil the requirements in every particular. Write us for prices.**

**Wilson Bros., Limited - Collingwood, Ont.**

# The Three Goodhue Belts

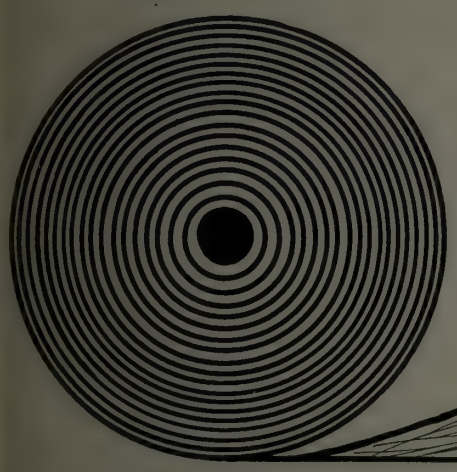
## "EXTRA" "STANDARD" "ACME WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

When you buy a belt—buy a Goodhue. Prices and particulars on request.



## J. L. Goodhue Company Limited
DANVILLE, QUE.

# For Cutting Pulp Wood

The **Ryther Multiple Saw Slasher** will cut 1,000 logs and over per hour into absolutely Uniform Lengths — Highest Possible Efficiency — Lowest Cutting Costs, per Cord — Minimum Maintenance and Repair.

**Write for Catalogue**

# Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

# Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

**W. W. Cory,**

We make a Specialty of

# Conveyor Chains

## For Lumbermen

WE make them from carefully-selected iron, and every link is guaranteed ***strictly hand-made***—not the inferior machine-made.

The point is worthy of special emphasis.

We make the chains according to any dimensions desired, guarantee splendid workmanship; uniformity; dependability.

Prices are the lowest possible for the class of work we furnish, and Quality above criticism.

Let us quote for your needs.

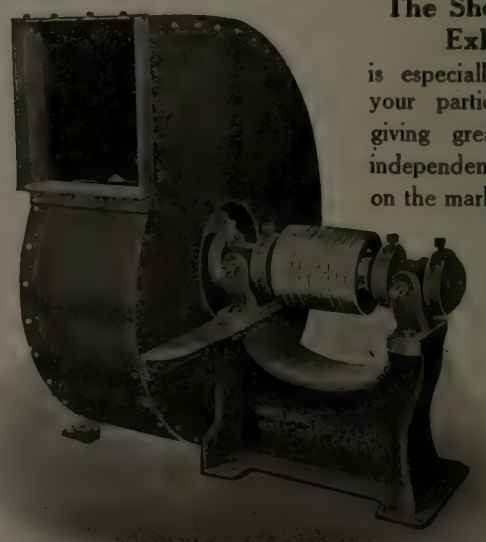
**Send for catalogue giving estimated weights of various sizes of chain; prove test; breaking, straining and safe-working loads, and giving hints regarding the care of chain which will prolong a chain's usefulness.**

## Woodhouse Chain Works

*P.O. Box 525* TRENTON, N.J.

# Planing Mill Improvements

**Every Manufacturer** in the Lumber Industry realizes that to be "up-to-date" their Factory should be installed with **Shaving Exhaust Fans.**



**The Sheldon Shaving Exhaust Fan**

is especially designed to suit your particular requirements, giving greater efficiency and independence than any other on the market.

*See our New Catalogue*

## Sheldons Limited - Galt, Ontario

**Toronto Office, 609 Kent Building**

AGENTS:

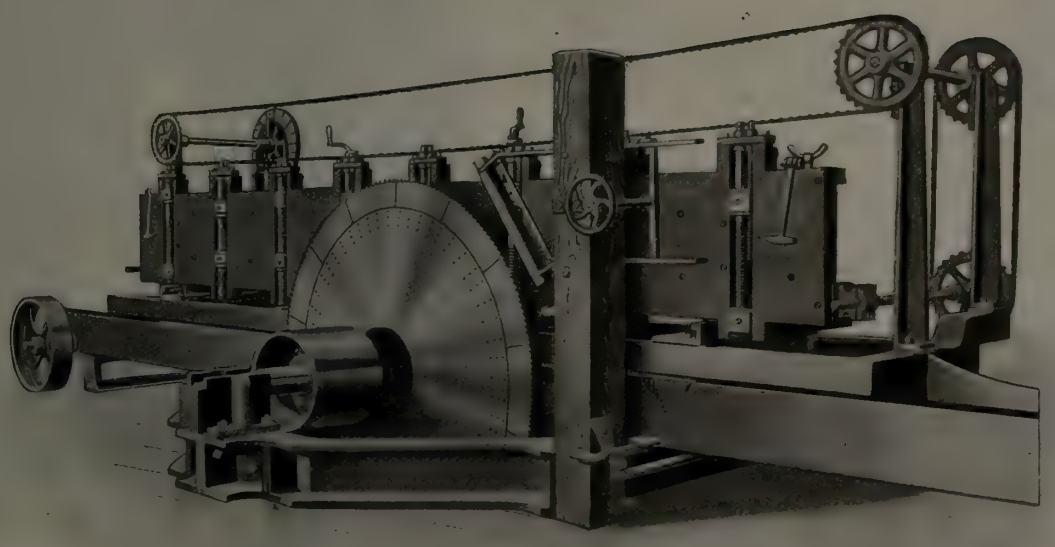
Messrs. Ross & Greig, 412 St. James St. Montreal, Que. Messrs. Walker's Limited, 259-261 Stanley St. Winnipeg, Man.

Messrs. Gorman, Clancey & Grindley, Ltd., Calgary and Edmonton, Alta.

Messrs. Robt. Hamilton & Co. Ltd., Bank of Ottawa Bldg., Vancouver, B.C.

# Coe Veneer Machinery

# Veneer Saw



The Coe Veneer Saw will saw any kind of veneer or thin lumber, but is principally used on Oak, Mahogany, Cedar and Maple; under ordinary circumstances it will saw from ten veneers out of 1 inch stock up to material 3/8 inch thick. Any good sawyer can turn out more and better cut veneers with the Coe Veneer Sawing Machine than he is capable of doing with any other make and do it with perfect ease. They are made in four sizes, 12′ 14′ 16′ and 18′.

The machine is constructed entirely of iron and steel so that nothing can warp or get out of true.

This machine will saw a log down to within 3/4″ without unclamping it. 15 Horse Power is required to operate any size.

The capacity of a Coe Veneer Saw depends upon the width and length of flitches, but on flitches of average width and length a good sawyer can produce from 3,000 to 5,000 surface feet of quarter sawed oak 1/20 inch thick in ten hours.

***Write us for literature.***

## The Coe Manufacturing Co.

**Painesville, Ohio, U. S. A.**

*Established 1850*

***The oldest and largest manufacturers of complete veneer equipment in the world.***

# The Connecting Link

Way back in 1880 the **Wanted and For Sale** columns of the Canada Lumberman and Woodworker were used extensively by the lumbermen of Canada for the purchase and sale of timber, lumber and machinery.

Time has but served to enhance the value of this medium, until to-day the **Wanted and For Sale Department** of the Canada Lumberman has become a national market.

Twice a month "the paper with the green cover" brings together buyers and sellers of lumber and machinery from all the principal lumbering centres of Canada and the United States. By covering this wide field, the percentage of waste circulation for advertisers has been reduced to a minimum.

For quick and satisfactory results, get your advertisement in the **Wanted and For Sale Department** of the

**Canada Lumberman & Wood Worker**

Published 1st and 15th of the Month

# *Only the Best Is Good Enough*

THE work your filer does is limited to a great extent by the equipment he uses.

Give him the kind that allows him to keep your saws in the best possible condition—and his work will be reflected in the out-put of your mill.

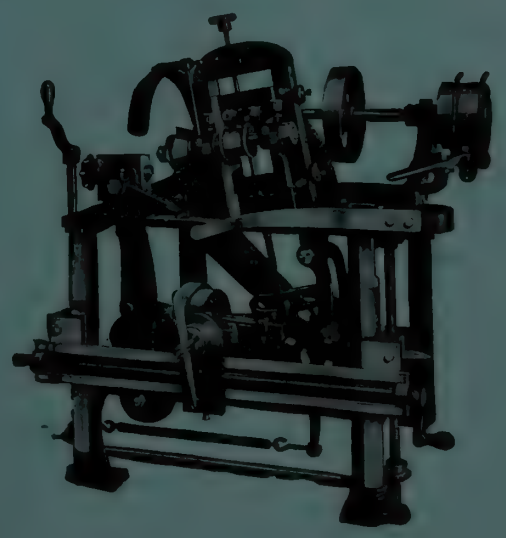
Smooth cutting, easy running saws mean smooth sawn lumber—the secret of both is—

# "COVEL" SAW FILING EQUIPMENT

## For Band and Circular Mills--Any Size

Both in Canadian and American installations, where severe saw service is the general rule, COVEL Filing Room Equipment is giving excellent results. It is producing larger cuts of better lumber wherever used. Your filer needs that kind of equipment.

We can supply COVEL Saw Filing Tools capable of handling circular saws up to 84″ in diameter and bandsaws up to 20″ wide, that will help him keep your saws in better shape at less cost than ever before.



There is only one kind of Saw Filing Equipment good enough to use on good Saws—the best. "COVEL" is the name. Remember it when you are buying Filing Room tools.

"Leather like gold has no substitute."

A Good Belt for Wet Runs

Thoroughly Waterproof Oak Tanned

# "AMPHIBIA"

***Made in Canada***

# Leather Belting

Despite the many substitutes offered, leather belting is still the most efficient medium of power transmission and likely to remain so indefinitely.

To drive your machines that are producing *"Made in Canada"* articles you should use "AMPHIBIA", *"Made in Canada"* belting.

"AMPHIBIA" belting is made from the best hides selected for their suitability for belting. They are given a special waterproofing tannage in our own tannery under intelligent supervision.

"AMPHIBIA" belting resists exposure to oil, water or heat generated by pulley friction.

When ordering "AMPHIBIA" belting state where the belt is to run.

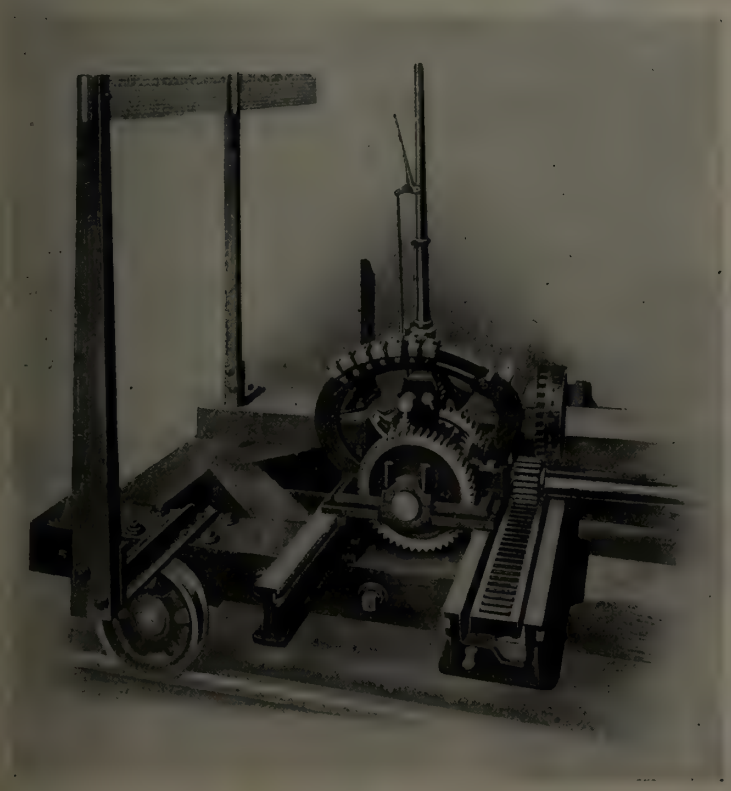
## The Long Lumber Company

HAMILTON, ONT.

# "Lane" Double Acting Setting Device



When the average daily cut of the mill is expected to exceed 18,000 or 20,000 feet, we advise our customers to have their mills equipped with the accompanying pattern of setting device. This setting device has many advantages for rapid sawing.

The Lane Patent Double-Acting Back Lever Setting Device as illustrated is very simple. The device will set for any thickness up to 2 inches, by a single throw of the lever, either forward to the latch, or back to the "home-rest" and up to 4 inches by a double throw, that is forward to the latch and back to the "home-rest."

We will be pleased to send you detailed information of this setting device. Write us.

## To the Owner of Timber Lands

Far sighted owners of timber lands should take advantage of the times incident to the European wars, and prepare themselves for the day when the demand for timber is suddenly thrust upon them. This is certain to come at no distant day. Therefore cultivate a closer acquaintance with your holdings, and the best method of marketing them. Let us prepare the way for you. Remember, we not only report on the property, but assist in marketing the bond issue when necessary. Send for our booklet.

# Where Can I Get It?

I intend to build and want to use Arkansas Soft Pine. Please give me address of nearest dealer.

Where can I get Arkansas Soft Pine Trim for the house I am building?

Please send me finished samples of Arkansas Soft Pine. Also wish you would give address where it can be purchased.

I wish you could get my dealer to order a car of Arkansas Soft Pine finish and ceiling. I will do what I can.

Honest to goodness, is there any reason why you should not handle the kind of lumber people want?

The owner wants Arkansas Soft Pine, the Architect is specifying it and the contractor must get it, somewhere, somehow.

# Why Not Get It From You?

For business reasons you can afford to handle stock in which the owner, the architect and the contractor are interested and for which there exists a consistent and persistent demand.

A complete line of Arkansas Soft Pine trim gives you command of the interior trim trade of your community that you can secure in no other way.

Arkansas Soft Pine is recognized as the Standard Soft Wood Trim of America. With your active co-operation it soon will be the Standard Wood Trim of America. —And you, the dealer, will get the business.

# Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

### We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

### FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

### POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 35 Toronto, April 1, 1915 No. 7

## The Atlantic Coast Vessel Famine

The report published elsewhere in this issue regarding the appointment of a commissioner representing the Dominion Government to visit Australia and enquire into the market for Canadian lumber with a view to assisting Canadian exporters in securing a larger share of Australian trade will arouse a great deal of interest in all parts of Canada. But in eastern Canada the question will at once be asked whether the Government will do what it can to promote the interests of the lumber manufacturing industry which looks to the Atlantic export trade for much of its business. There is nothing sectional about such a question. Any relief which British Columbia secures through the co-operation of the Government will be beneficial to the whole Dominion. Likewise, if the Government can do something to improve the situation on the eastern coast of Canada, the benefit will be general. The Canada Lumberman receives many letters referring to the difficulties which have developed in the eastern provinces on account of the scarcity of vessels. During normal times transportation from the eastern coast, to the important export markets is comparatively satisfactory; but since the commencement of the war, shippers from Atlantic ports have been suffering from as great a handicap as those of the Pacific coast.

One large eastern manufacturer, writing to the Canada Lumberman, says:—"At the present time if we had the freight vessels for carrying lumber, there would be no trouble at all in doing business with a great many countries that heretofore we have not been able to touch. France is now looking for lumber here and Belgium will be in the market very shortly. But the great country that we should be supplying with very large quantities of lumber at the present time is Great Britain. Owing to lack of tonnage it is impossible to ship our lumber. The freight rates have advanced about 400 per cent., but in spite of this the vessels are refusing to take lumber, claiming that other freight is paying them very much better rates. The fact is, that practically all the line vessels today will not take any lumber whatever and the lumbermen are badly handicapped. There are many openings in Great Britain today for dressed lumber and we could ship large quantities if we had the vessels for carrying it everywhere. Our opinion is that the thing to do now is to agitate and see what can be done to provide vessels for carrying lumber. There is a great call for lumber in the rough and also for dressed lumber today in England that we could supply if we could get at the market."

This letter is typical of others and of many reports which appear from day to day. They show that while we are making great efforts to increase our export trade, we are apparently driving against a brick wall. The British Columbia lumbermen have been so successful in persuading the provincial and Dominion governments to take action on their behalf with a view to remedying the situation caused by lack of vessels for export shipments that the lumbermen of the eastern provinces should consider seriously whether they should not take their cue from this and present their case, no less urgent and important, before the Dominion Government, by resolutions, facts and figures, so as to show the actual opportunities which are being lost and the possibility of taking advantage of them if adequate shipping facilities are provided.

The Dominion Government is now in a sympathetic frame of mind regarding all movements for increasing trade, and if it can find a means of improving the situation in British Columbia it can probably also do the same thing upon the Atlantic coast, where the problem is a smaller one than that of the west, for it does not involve the creation of a new service, but only the removal of a temporary barrier which, to a large extent, will be automatically removed after trade conditions have returned to normal. The demand for lumber is so urgent in Great Britain and the opportunity now before the lumbermen of eastern Canada to meet the requirements of this demand is so definite that the lumber manufacturers and exporters of eastern Canada ought to do everything possible to place this situation clearly before the Government so as to secure its co-operation.

## Government Co-operation in Export Trade

The announcement made recently by Hon. W. R. Ross, Minister of Lands for British Columbia, in an address delivered in the Legislature, that Mr. H. R. MacMillan, chief forester for British Columbia, would leave immediately on a visit to Australia as a representative of the Department of Trade & Commerce of the Dominion Government, to enquire into the market for Canadian lumber, is one of the most important developments in connection with the Canadian lumbering industry that has taken place for many years. The decision to send Mr. MacMillan on this important mission is a direct result of the activity of the lumbermen of British Columbia in urging upon the Provincial and Dominion Governments the necessity for enlarging our export trade in lumber. With so competent a representative as the chief forester for British Columbia, it is confidently expected that the result of this step will be considerable. Mr. MacMillan is going upon this mission as a representative of the Dominion Government and will therefore look into the situation in the interests of all Canadian lumber manufacturers. It may be assumed in advance that he will return to Canada with a great deal of valuable information regarding the markets which he visits, and that if there is any inclination on the part of the Government of Australia to arrange for a preference for Canadian lumber in that country, Mr. MacMillan will be able, by his presentation of the case from a Canadian point of view, to advance negotiations towards that end materially. British Columbia exporters believe that with a preference in the Australian market they would be able to secure a large portion of the trade, instead of a paltry five per cent., which is the present share. Such a result would go far towards placing the export trade of British Columbia on a permanently sound basis and would therefore have a direct and beneficial effect upon the industry in other parts of Canada, particularly upon that of the Mountain district of British Columbia, which at present has to share with the Coast mills the trade upon the prairie provinces, which should naturally belong largely to Mountain producers.

Hon. Mr. Ross, in speaking of Mr. MacMillan's appointment,

laid particular stress upon that feature of the matter which is admitted by all to be the crux of the situation, namely, the necessity for providing better shipping facilities for ocean transportation. The chief reason why United States exporters have been able to secure so large a share of the trade of Australia in the past is that they have organized their shipping business to such an extent that most of the cargoes going to Australia, whether they consist of Canadian or United States lumber, are handled by United States shipping firms. The result is that orders, whenever possible, are given to United States manufacturers instead of to Canadians. It is natural that the United States shipping firms and brokers should prefer to see the business go to United States manufacturers. Canadians would do the same thing under similar circumstances. The only solution of the trouble is that Canadian shipping interests should be established which would place Canadian exporters on an equal footing with those of the United States. Hon Mr. Ross made the important announcement in this connection that the sum of $50,000 had been included in the provincial estimates, to be used largely in the effort to secure shipping facilities. Shipping subsidies, in some form, would be given to promote this purpose. Moreover, in case it is found as a result of Mr. MacMillan's investigations that it is necessary for the Government to take further action, he pledged the Government to follow up the matter vigorously. The Government, he said, was determined to put an end to the unnatural conditions now prevailing.

The British Columbia Government in fact, has been so thoroughly persuaded by the lumbermen of the importance of enlarging the markets for British Columbia that, in Mr. Ross' words "it has now become the duty and business of the governments to undertake the second stage of the programme and to give practical assistance to the marketing of timber. Payrolls, profits and public revenue alike depend upon the energy with which this broader policy is followed up. . . . . It is perfectly plain that the lack of success of British Columbia lumber in foreign markets is out of all proportion to the very solid asset in the way of timber that the province possesses. We have the timber and the materials to manufacture it. By every commercial test the province is entitled to play an important part in the world's trade in lumber. We are not doing so. Something is wrong. What is it?" Investigation has shown that British Columbia manufacturers and exporters have not been lacking in aggressiveness in pushing into export markets. The greatest energy and persistency has been shown but they have been waging a losing fight. The reason lies in a nutshell. We cannot get the ships. It is a most significant fact that, although the Australian Government recently desired to place an extensive order in British Columbia, and although the mills were ready to fill the order at once, and at the lowest market price, it could not be secured because there were no vessels for its shipment, even though shipment after shipment was being made from California, Washington, and Oregon. British Columbia exporters can only deal with the sister Dominions of the Empire through the agency and by the favor of United States brokers, United States lumber buyers and United States shipping companies, a situation which is unbearable and must be remedied with all possible speed. Hon. Mr. Ross' announcement has been received by lumber manufacturers in British Columbia with the greatest satisfaction. The pursuance of this policy to its logical conclusion should result at an early date in the placing of vessels upon the routes between British Columbia and the great trans-Pacific markets, which will bring about a new era for the British Columbia lumbering industry.

# Association Influence Increasing in the Lumber Trade

The increased interest shown by Canadian lumbermen in Association work is an important evidence of the fact that they are taking a wider view of their business responsibilities and opportunities than formerly. It is only a few years ago, comparatively speaking, since the Canadian Lumbermen's Association was formed, and there were many who hesitated to believe that such an association could be of any real value to the lumber trade or industry. The formation of this association, however, was the forerunner of others, and it has developed in its own field of activity until it has now become an important factor in the promotion of the general interests and welfare of the trade. An extensive and important list of lumber associations of one kind or another which now exist in Canada and are all doing important work, could be drawn up to indicate the growth of the movement. These include associations of manufacturers, local groups of lumbermen representing all three branches of the business, associations of timberland owners for the protection of their timber areas from fire, and associations of retailers for the promotion of the interests of the retail trade. They are found in every part of Canada and they are doing an excellent work in their various fields. The formation of a Lumbermen's Section of the Toronto Board of Trade is the latest addition, and another important association of manufacturers in Ontario is being worked out which will soon bring into existence a strong organization to promote the welfare of a group of industries whose interests are largely identical. There is still room for other associations, and unquestionably they will develop from time to time. The field is far from being fully occupied and the work is of such importance as to promise very substantial results wherever it is taken up vigorously and enthusiastically.

There was a time, some years ago, when a proposal to form a new association of lumbermen of any kind met with little or no support of a practical nature, and several associations which could have been developed into useful organizations became defucnt, because of lack of interest. Today, however, the situation shows a great difference. The Canadian Lumbermen's Association, for instance, is becoming a most important factor in the progress of the lumber industry, and has done so much to promote the interests of lumbermen that its standing and importance are now recognized fully in every part of Canada. The work which it has done in watching legislation and in representing the interests of lumbermen before the Dominion Board of Railway Commissioners whenever the railway companies have sought to encroach upon the interests of the trade by establishing freight rates which are detrimental to its welfare, or are not justified by industrial conditions, has been of inestimable advantage to lumbermen and to Canadian shippers in general. At the present moment the association is ably presenting before the Railway Commissioners the unanimous protest of the lumber trade against the increased freight rates which the railway companies have requested. So strong has been the case which the association, in conjunction with the Montreal Lumber Association and the Canadian Manufacturers' Association, has presented, that the railway companies will have great difficulty in bringing forth sufficient argument to justify the Board in permitting the increase to become effective.

The youngest association of lumbermen in Canada today is the Lumbermen's Section of the Toronto Board of Trade, which has recently been formed, and which held its first regular meeting on March 19th. It is significant of the interest taken in association work that at its first meeting this association immediately recognized the importance of its work by taking up the freight rate question and deciding to co-operate with the other bodies which are fighting against the proposed increases. Although a young institution, the Lumbermen's Section of the Toronto Board of Trade has behind it all the influence and resources of the Toronto Board of Trade, an influence which is certain to be felt in future as a factor in promoting the welfare of the trade.

Another indication of the value which such an association of lumbermen can be to the trade is indicated by the second question which was taken up at the first meeting of the Toronto lumbermen, which shows that the association intends to lose no time in getting down to a business-like consideration of the large problems which confront it. Probably the most difficult problem the lumber trade has to face today is that which grows out of the manner in which credits are handled. There is no uniformity in the manner in which credits are looked after even in any one locality. Each firm is dependent entirely upon its own vigilance for finding out the pitfalls which exist everywhere in connection with selling lumber on credit. The whole trade is based upon a credit foundation and individual

success depends more than anything else upon the skill with which a firm handles its credit problems. There is no more logical field for the activities of an association of lumbermen than is afforded by this question. The Lumbermen's Section of the Toronto Board of Trade discussed this at its second meeting, and if there is any way of working out a reasonable form of co-operation between the members of the trade in Toronto, whereby firms may be able to place their credit affairs upon a sound basis of actual acquaintance with the standing of the people and firms with whom they are doing business, it is likely to be found out and put into practice. Many other questions of importance will come up for consideration from time to time.

There is no lack of material for such an association, or for any association of lumbermen to work upon. The only question is, whether the members will realize the power there is in co-operation and make the best use of it. This is something which the future alone can reveal, but the growth of the association movement in Canada of late and the interest shown by lumbermen in connection with these matters which concern them as a body, point to a successful future not only for the Toronto association, but for all other associations of lumbermen in Canada.

# Hunting Out Export Markets—The Case of Bermuda

Anyone who looks over the statistics issued by the Dominion Government in connection with the export trade of Canada cannot fail to be struck by the fact that our shipments to some countries, which apparently present a good market for our products, are ridiculously small. Many instances of this could be found even by a casual examination of the reports. A great deal has been said lately about the importance of the foreign markets. Before the dislocation of trade which followed the war, we heard much less upon this subject. An instance of the interest now being taken is the case of Australia, which is being studied pretty thoroughly. The wonder is why this study was not commenced a good many years ago. The spur of necessity alone seems to have wakened up some Canadian lumbermen to the importance of this market.

Some of the small export markets also show the same indifference on the part of Canadians. The case of Bermuda, for instance, is interesting, and illustrates this point clearly. The imports of lumber, lath, boxes, box material, and spars, etc., into Bermuda during the latest year for which figures are available were valued at $62,-353. Canadian exports of all kinds of wood goods to Bermuda for the fiscal year ending March 31st, 1914, amounted in value only to $16,032, which is only about 22 per cent. of the total shown above. This total, moreover, is probably considerably smaller than it would be if we were able to include in it the same articles as those which are included in the Canadian export list.

When we consider that the United States is so favorably situated for catering to the requirements of Bermuda in the way of wood goods, we might conclude that the Canadian showing is a fairly good one. Bermuda, however, is an English Colony. Canadians visit it in large numbers annually. Its people are naturally disposed to favor British or Colonial products if they can get them, and Canadians ought to have a far greater share than 22 per cent. of the lumber trade.

There are no restrictions to the importation of any article into Bermuda as a result of the present war, as there are no manufacturing plants of any kind in the Colony, and the imports are all finished articles. Bermuda has always enjoyed good credit. The leading merchants are men of high standing and business ability. The Colony has progressed and belief in its continued prosperity is manifested by the considerable number of buildings that have been erected in the past. There are excellent banking facilities in the Colony. The Quebec Steamship Company of Canada and the Royal Steam Packet Company have regular weekly service between New York and Bermuda. During the winter season the service is supplemented by additional steamers. The conditions in fact are all such as should invite Canadian merchants to seek trade. If adequate attention were given to this market we believe that it could be developed to quite an important extent. The United States, however, is far in the lead in the imports into Bermuda. Canadians, if they desire to enlarge their share of the trade must give it much closer study than they have in the past.

The case of Bermuda is typical of others. It brings us at once to the question why Canadians have not taken greater advantage of the opportunities presented; why they have neglected, in fact, opportunities which apparently are calling for their attention. There seems to be something about export business which has discouraged Canadians in the past from looking into the opportunities as fully as they should, whereas the opposite ought to be the case. If you talked to a Canadian manufacturer a year or two ago about such a market as Bermuda, the probability was that he would show only casual interest and say that such a market was too small, too difficult to cater to, or presented too keen a line of competition to make it worth while going after. For a time this was the kind of interest which most Canadian manufacturers took in connection with the particular case of Bermuda. A progressive Canadian who went to that country and established himself in business, however, same back to Canada in order to secure agencies. He was met in every instance with objections of the variety referred to above. He was told that the trade was not worth going after or that the United States firms had too great a hold upon it. He stuck to it, however, securing a few good agencies, and from the very beginning worked up a surprisingly large business. We believe that the same thing could be done with wood goods, and that Canadians, instead of only having about 22 per cent, of the trade, might have something like 75 per cent. of it.

# Freight Rate Increases Not Justified

The arguments which have been presented by the various representatives of the lumber trade, before the Dominion Board of Railway Commissioners in opposition to the application of the railway companies for permission to increase their freight rates between points east of Port Arthur, show that the lumber trade is unanimous in its views upon this very important matter. At Ottawa, Montreal and Toronto the lumbermen presented to the Board a very concise and forcible set of facts and figures, to show that there would be no justice in granting the railway companies the permission they are seeking and that the lumber industry, in connection with every other trade and industry in Canada which makes use of the railway companies for the shipment of its goods, is today in no position to stand such a strain as the railway companies propose to put upon them. The aspects of the case which have been presented to the Board are confined largely to facts and figures. They are unusually strong in their bearing upon the lumbermen's claim that the increase would be unreasonable and unfair. They show that the burden upon the trade would be an extremely heavy one, even in prosperous times. To-day, when business is restricted to such a great extent and competition is so keen, the trade would suffer out of all proportion to the relief for which the railway companies are asking.

The shipping public have not always opposed the railways in their requests for increased freight rates. The average business man is a far-seeing individual who knows that if the railway companies are not prosperous, trade in general will be affected adversely. When times are good the successful business man frequently joins with the railway companies in recognizing the reasonableness of raising freight transportation charges. In the United States last year one of the chief factors in persuading the Interstate Commerce Commission to grant the application of the railways for increased freight rates was the approval of a large number of shippers, prominent among them being lumbermen, who understood that if the railway companies secured increases they would become purchasers of timber and lumber for car building, track laying, etc., and that the benefit would

not be confined to the railway companies, but would be felt throughout the general trade of the United States. In that case the railway companies had long been out of the market as purchasers of lumber and other materials for the upkeep of their tracks and equipment. They were able to show the Commissioners that they could actually come into the market for these things and become an important factor in the improvement of general business conditions. The matter came down with remarkable precision to a mathematical demonstration and the railway companies showed that their solution of the problem was reasonable. They got what they asked for and soon showed signs of living up to their promises, with the result that business commenced to improve.

In Canada we could not look for any action on the part of the railway companies similar to that which has developed in the United States. We have no reason to feel that they would follow an increased freight rate by becoming purchasers of raw materials in large quantities. The fundamental conditions connected with the application of the Canadian railways are very different from those which prevailed in the United States a year ago. The railway companies in Canada today are simply telling the Board that they, like nearly everyone else in Canada, are suffering on account of the combination of circumstances which led up to the present curtailment of trade and industry throughout the Dominion. These circumstances had their origin several years ago, when Canadians—the railway companies included—exceeded the limits of wisdom in their expenditures and operations generally. The culmination came with the outbreak of the war, which brought the situation to a crisis. The railway companies have had their share of good times in Canada along with everyone else. They should now be ready to wait patiently for the return of business activity before seeking to increase the charges for their services.

In the arguments which the railway companies have made before the Railway Commissioners there is one important fact which stands out prominently, namely, that the railway companies do not present their figures in a manner which permits of forming an accurate idea of the situation. Their accounting methods, so far as they are brought to light by such applications as the present one, are not logical and fair. It is not possible to learn from the figures presented what the actual cost is of performing the services for which they desire to increase the charge. These figures do not demonstrate to the Board or to anyone else that they are rendering these servics at a loss or even at a figure which permits of no profit. In fact, the figures do not definitely prove anything. The flaw is found in regard to the manner in which operating costs are presented. The railway companies do not show their freight operating costs separate from their passenger operating costs. The public is therefore not able to appreciate their claim that they are carrying freight at a loss. There is no question in the minds of those who study this feature of the case from the shippers' point of view, that such a separation of operating costs would show that the freight earnings, under present conditions, are bearing an unreasonable proportion of the operating expenses. The Board of Railway Commissioners and the public would have more reason for considering the railways' application sympathetically if their case were presented so as to show these costs in the manner suggested. Taking all the factors of the present application into consideration and especially considering the inopportune moment at which the request is made, together with the unconvincing nature of the reasons advanced for it, the application is one which should be refused.

### Second Cargo of B.C. Timber for Toronto Harbor

The Steamer Bessie Dollar, of the Robert Dollar Steamship Company, called at Genoa Bay, B.C., during the third week of March, to load the second cargo of the order for British Columbia timber to be taken to Toronto for use in the harbor improvement works. The order was placed a year ago with the Cameron Lumber Company, Victoria, and amounted to 25,000,000 feet. The first cargo of 5,000,000 feet was taken out by the steamship Robert Dollar which sailed from Victoria on June 25th last and discharged her cargo at New York and New London, Conn. The Robert Dollar is the vessel that was detained at Rio de Janeiro after the outbreak of the war, the captain wishing to change to American registration at that point. The Robert Dollar was subsequently placed under American registry. The Bessie Dollar, which is now taking the second cargo of this order, is still flying the British flag and will probably continue to do so, since the dangers to merchant vessels have been removed. Her cargo will amount to 4,000,000 feet, a slightly smaller shipment than that which was carried by the Rober Dollar. At latest reports, she was expected to commence her voyage with this cargo about the end of March and to proceed by way of the Panama Canal to the Atlantic Coast. Her port of dischage has not been announced, although it is expected that she will put the lumber off at New London, Conn., whence it will be taken by rail to Toronto. The greater portion of the 25,000,000 feet in this order will be shipped this year.

# Lumbermen Oppose Freight Advance

## Show Railway Commissioners How Increases Would Effect Trade Adversely—The Railroads' Arguments

Montreal, March 24th (Special to Canada Lumberman): The Railway Commissioners on March 18th held a hearing at Montreal to receive further objections against the proposed increase in freight rates east of Fort William. The lumber and pulp trades made additional protests against the new schedule, following up the arguments presented before the Commissioners at Ottawa. The lumbermen were represented by Mr. W. S. Tilston, of the Montreal Board of Trade; Mr. Arthur H. Campbell, president of the Montreal Lumber Association; and Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association; while the Pulp and Paper Association were represented by Mr. Arthur H. Huff, of Laurentide, Limited.

### Effect Upon Ottawa Valley

Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association, who had presented the objections of the lumbermen to the proposed increases at the previous session of the Board in Ottawa made further a statement at Montreal. The effect of the proposed rates in connection with some of the important Ottawa Valley lumber shipping points, as shown by the statement made by Mr. Dewey, freight traffic manager of the Grand Trunk, would be, he said, as follows:—

| | | | | | | |
|---|---|---|---|---|---|---|
| Ottawa rate points ... ... | 5 | 5 | 5 | 6 | 6½ | 7½ |
| Arnprior & Braeside ... ... | 7 | 7 | 7 | 8 | 8½ | 9½ |
| Pembroke ... ... ... ... ... | 8 | 8 | 8 | 8 | 9½ | 10½ |

Continuing Mr. Hawkins said:—

"The 1914 increase on Ottawa rate points for local shipments was 20 per cent. over the 1913 rate.

"The proposed 1915 increases over 1913 on Ottawa rate points are on export 30 per cent. and on local shipments 50 per cent. plus $2.50 per car for harbour commission switching which the railways now say they will no longer absorb."

He urged that the Board should issue an order instructing the railway companies to file tariffs providing for exactly the same rates on lumber during the coming season, for summer shipment to Montreal (local and export and between other points where special summer rates were in effect) as those which had existed during 1914, and that these rates should become effective not later than April 15th. It was unfair that the railways should be permitted to continue the present winter tariffs, pending the decision of the Board on the whole question, thus penalizing the lumber trade in the meantime. The movement of lumber was largely during the summer months when construction operations could be carried on without interruption on account of the weather.

Mr. Hawkins pointed out that the conditions which existed in 1914 had been abnormal and should not be taken as representing conditions upon which to make application for increased freight rates. To say that rates should be increased in order that the railway company might continue to pay dividends on stock and securities, without regard to the value of the service performed, would be to place the shipping public entirely at the mercy of the carriers. The whole question was one which should rest upon the consideration of what rates were fair in regard to the service rendered. He quoted several references to this matter in previous judgments of the Board, one being by the late Chief Commissioner, Judge Mabee, in which he said:—"The question for us to decide is what rates are fair, irrespective of how much any company is worth or is not worth."

Mr. Hawkins also submitted that inasmuch as the freight earnings of the railways are kept separate from passenger and other earnings, in like manner the cost of freight operating should be kept ssparate from passenger and other operating expenses. If this were done there is not the slightest doubt that it would be seen that freight earnings bear an unreasonable proportion of operating expenses.

Statements from Messrs. Watson and Todd and W. C. Edwards & Company, Ottawa, showing the effect of the increased rates were put in.

### A Heavy Tax Upon Montreal Shipments

Mr. Tilston put in a table prepared by the Montreal Lumber Association showing the shipments by rail during 1913 and 1914 by seven local firms in the domestic trade. These shipments by summer rates were 1913, 43,622,427 lbs.; 1914, 31,501,462 lbs. Lumber shipped by the firms by regular rates were: 1913, 197,368,364 lbs.; 1914 135,873,748 lbs. The table also shows the rail shipments of three export firms: 1913, 70,144,972 lbs.; 1914, 45,724,402.

The attached statement was signed by Mr. Arthur Campbell, the president:

Of the large number of firms in the local or export lumber trade the figures in the annexed statement include only the business of seven firms in the local trade and three firms in the export trade. It is impossible to estimate how much lumber was handled during 1913

and 1914 by those firms not included in this statement, but the quantity must have been very large.

Where the actual weight of shipments was given by the firms in the enclosed table such weight is quoted, but in the majority of cases it was necessary to estimate the weight based on the quantity of lumber in feet b.m. in which case 2,500 lbs. was taken as the weight of a thousand feet, irrespective of whether the lumber was hardwood or softwood. This estimated weight is therefore considerably under the actual weight for the amount of lumber given.

As the railway companies have expressed their intention of abrogating the summer rates for the coming season the total increase in the amount of freight which will be paid on lumber formerly enjoying the summer rate would, if the Board granted a general increase of ½c. in addition to the abrogation of the summer rates, amount to 1½c. per 100 lbs. and for the seven firms mentioned the total increase would be as follows:

| | | |
|---|---|---|
| 1913 ... ... | 43,622,427 lbs. at 1½c. per 100 | $6,543.24 |
| 1914 ... ... | 31,501,462 lbs. at 1½c. per 100 | 4,725.14 |

If the general increase of ½c. is allowed the total increase based on the quantities mentioned under the heading of "Regular Rates" would be as follows:—

| | | |
|---|---|---|
| 1913 ... ... | 197,368,364 bs. at ½c. per 100 | $9,868.41 |
| 1914 ... ... | 135,873,748 lbs. at ½c. per 100 | 6,793.68 |

If the general increase in rates is not granted and the railways secure only the difference between the summer rates and the regular winter rates on the summer business, the following would be the total increase:—

| | | |
|---|---|---|
| 1913 ... ... | 43,622,427 lbs. at 1c. per 100 | $4,362.00 |
| 1914 ... ... | 31,501,462 lbs. at 1c. per 100 | 3,150.00 |

The total advance on the lumber shipped during the whole year if the ½c. advance is allowed, made up by 1½c. advance on summer shipments and ½c. advance on balance would be:—1913, $16,411.65; 1914, $11,518.82.

### Railroads Talk of Higher Export Rates

Mr. C. E. Dewey, freight traffic manager of the Grand Trunk, in reply, said that the railway companies had to meet, more or less, water competition. He pointed out that the proposed rates from Ottawa to Montreal were 7½c., or a cent lower than from Georgian Bay to Toronto. The rates to Montreal, he argued, were too low, owing to water competition. Having regard to the conditions, he urged that the proposed additions were reasonable.

Mr. Campbell replied that the rates from Georgian Bay to Toronto were excessive in comparison with those from Albany, New York, to Hoboken or New York City, where the rate, track delivery, for 150 miles was 6.03c. per 100 lbs. Further, the Grand Trunk had a rate on lumber from New London to Toronto, over 700 miles, of 12½c.

Mr. Kirkpatrick, of the C. P. R., intimated that the company intended to raise their rates for export lumber.

This announcement led to a vigorous protest by Mr. Campbell and by Mr. W. A. Filion, of E. H. Lemay, who pointed out that contracts had already been made by shippers on the basis of last season's rates. This advance would be a considerable hardship on shippers.

The Chairman remarked that as the Grand Trunk had not notified the exporters that the rates were to be discontinued, it was only natural that the exporters should have made their contracts on the old basis.

Mr. Huff, for the Pulp and Paper Association, said he intended to file statements showing the effect of the increase on 75 mills. This, however, would take a little time, and the chairman said the Commission would deal with this matter at a later date when they would sit in Ottawa.

In dealing with the general situation the Chairman remarked that the whole question was how much more money the railways needed, and the distribution of charges by which they proposed to get it, and whether they could show that such increases were necessary and reasonable.

The hearing was adjourned until Monday, March 29, in Toronto, when each road was to make applications separately, as the Chairman decided that the Canadian Freight Association has no locus standi.

---

Many lumbermen in Canada, including in particular all those who have been associated with the Concatenated Order of Hoo-Hoo, will learn with great regret of the death of Mr. James H. Baird, past Scrivenoter of Hoo-Hoo. Mr. Baird's death occurred on March 15th, at Nashville, Tenn. In addition to his long and important connection with Hoo-Hoo, much of the success of which was due to his untiring and unselfish efforts, Mr. Baird was widely known throughout the United States as the president and editor of the Baird, Cowan Publishing Company, publishers of the Southern Lumberman, of Nashville, Tenn. Mr. Baird's death resulted from his having been struck by a train at Nashville, Tenn., while walking from a sleeping car to the station.

# Will Fight the Freight Advances

## Lumbermen's Section of Toronto Board of Trade Co-operating with C.M.A. and Others in Opposing Railways' Request

A meeting of the lumber section of the Toronto Board of Trade was held in the Assembly Rooms of the Board of Trade on March 19th. There was a good attendance and matters of much importance were discussed. At the conclusion of the luncheon Mr. J. L. Campbell, chairman, made a short address. This was the first occasion, Mr. Campbell said, upon which the section had met for the transaction of routine business. It was about a year since the first meetings were held which resulted in the formation of a Toronto Lumbermen's Club. Numerous interesting meetings of the club had been held and efforts had been made to establish the club upon a permanent basis. These had resulted finally in the decision to form a Lumbermen's Section of the Toronto Board of Trade. The preliminary arrangements in this connection had now all been completed. The section had been formed and this was its first regular meeting under its new name. He was convinced that the organization would be a great advantage to the lumber trade of Toronto. The sucecss of the Section however, would be in proportion to the efforts made by the individual members themselves. It was up to them to make the greatest use they could of the organization which they had now completed. He felt sure that when they had troubles to settle or maters of importance to discuss, they would find the officers whom they had appointed ready to give them the fullest possible assistance and he hoped that they would individually enter with enthusiasm into the important work of promoting the interests of the trade by making use of the Section, which had behind it the strong backing of the Board of Trade itself.

After the minutes had been read and adopted, Mr. A. E. Clark, of Edward Clark & Son, referred to the proposed increase in freight rates, between points east of Port Arthur, for which the railroad companies are asking. The railway companies, he said, were apparently following out the lines of the United States companies which recently asked for and secured permission to make an average advance of 5 per cent. on their eastern lines. The Canadian lines however, had already applied a few years ago for permission to increase their rates and had been successful. Mr. Clark pointed out forcibly the burden which an increase would place upon lumber shippers in Eastern Canada during the present period of abnormally restricted trade. He did not think that the railway companies should have applied for permission to increase their rates at such a critical time. He suggested that it would be well to discuss this matter thoroughly and appoint a committee to act in unison with the Canadian Manufacturers' Association and the Toronto Board of Trade in their efforts to oppose the granting of the increased rates by the Dominion Board of Railway Commissioners. He understood that the Board was to meet in Toronto at an early date to hear arguments from both sides upon this question.

Mr. W. J. Lovering remarked that the difficulty with the railways was that they needed more trade, not that they needed higher rates. In this regard they were in the same position as all other Canadian business firms and should be ready to shoulder their share of the burdens which had fallen on the people of Canada.

Mr. J. B. Reid agreed thoroughly with Mr. Clark's suggestion. He said that the Dominion Board of Railway Commissioners was composed of men of hard common-sense and that at the hearing of the freight rate matter recently held at Ottawa the opponents of the proposed increases had been able to show them the absurdity of raising the rates and putting a further burden upon the trade. The Canadian Manufacturers' Association, he understood, wanted everyone to strengthen their hands in the fight against the railway companies. Although the Lumbermen's Section of the Board of Trade was a young institution it had behind it all the influence of an old-established institution, the Toronto Board of Trade. They should bear in mind therefore, that they really represented the lumbermen of Ontario, backed up by the Board of Trade. He did not think that the lumbermen should present arguments against the application of the railway companies from the point of view of high or low freight rates. They should first ask why the railway companies needed more money when they had been able to lay by such enormous profits in the past, taken from the people during good times. What the railway companies were trying to do now was to place a heavy burden upon the consumer who was finding it almost impossible to make sufficient money to meet his expenses as it was. The present was a time when everything possible should be done to reduce the cost of all kinds of necessities to the consumer. The railway companies should have bridged over this period themselves and been content to wait until more prosperous times before asking for an increase in freight rates. Mr. Reid therefore moved that a committee of the Section should be appointed as suggested by Mr. Clark. Mr. Lovering seconded this motion.

The chairman drew attention to the great importance of securing complete and accurate information upon this subject, to be presented to the Canadian Manufacturers' Association and the Board of Trade.

Mr. Clark added to his previous remarks by stating that the pro-

posed increase involved a serious discrimination against short distance traffic as compared with long distance traffic. This would be felt seriously by Ontario lumbermen.

Mr. A. E. Eckardt, of the R. Laidlaw Lumber Company, expressed his hearty agreement with the remarks of the previous speakers. He also impressed upon the members the importance of the Lumbermen's Section of the Board of Trade. A few years ago he said, the company with which he was associated had fought the railawy companies before the Board of Railway Commissioners and subsequently before the Courts in connection with the switching case. He did not think that they had received the support of one solitary lumberman in Toronto although they had tried to secure it. They had spent a good deal of money on this fight and had lost it. If they had had an organization then, like the Lumbermen's Section of the Board of Trade, the result might have been different. Even now he believed that if the matter were carried to a higher court they could win.

Mr. H. G. McDermid, Union Lumber Company, suggested that every lumberman should write to the chairman of the Section expressing his views on the freight rate question and that the chairman should consolidate the information he received in this manner and send it to Mr. Marshall of the Board of Trade and Mr. Walsh of the Canadian Manufacturers' Association who were representing the manufacturers in their fight against the railway companies.

Mr. Lovering drew attention to the fact that the meeting of the Dominion Board of Railway Commissioners in Toronto would be held on March 29th and therefore it would be necessary that they should take steps immediately to assist in the opposition to the railway companies.

On motion of Mr. Lovering it was decided to appoint a committee consisting of Mr. J. L. Campbell, as chairman, and Messrs. Eckardt, Reid and Lovering to deal with this matter. Another motion was carried that a letter should be sent to every member of the Section asking him to write to the chairman of the committee and express his views as to the proposed increase in freight rates, so that the chairman might have the information in definite form to present to Messrs. Marshall and Walsh.

Mr. Lovering introduced a discussion upon the dates for the regular meetings of the Section. He thought that a meeting once a month as provided for by the By-laws would not be sufficient and suggested that until further notice they should meet each Friday. A motion to this effect was carried. There will therefore be weekly luncheons at one o'clock on Friday in the assembly room of the Board of Trade and the meetings will be opened sharp at 1.30 p.m.

Mr. A. E. Clark gave notice of motion to be presented at the next meeting, that they should organize a credit department in connection with the Lumbermen's Section. The meeting then adjourned.

### Exporting Pit Props

Mr. Phillip Gordon, of the firm Mason & Gordon, of Montreal, was in New Glasgow, and contracted with Messrs. Grant & Campbell, lumber dealers, for a cargo of pit props. The props are to be delivered in Pictou, N.S., and will be shipped to the Old Country for use in the English collieries. This is, reported to be the initial cargo of the sort to be shipped from Nova Scotia and it is expected to lead to considerable further business. The firm of Grant & Campbell, New Glasgow, N.S., who have received this contract have gone very thoroughly into the examination of the pit prop situation and are preparing to ship several cargoes from Pictou. The coal companies are sending out the steamers for the props. The firm have been operating for five years in Antigonish and Pictou counties and cut about 5,000,000 feet annually of spruce and hemlock. Although comparatively a young firm they have had considerable experience in the lumber business and have already made an enviable reputation as successful and progressive operators.

### Reorganizing Hoo-Hoo

Following the joint meeting of the Supreme Nine and the House of Ancients of the Concatenated Order of Hoo-Hoo, which was held recently at Chicago, Mr. E. D. Tennant, Snark of the Universe, has sent out on behalf of the Supreme Nine a notice to all members of Hoo-Hoo, the object of which is to inaugurate prompt and vigorous action for repairing immediately the unfortunate conditions created by the prolonged illness of the Scrivenoter. After the meeting referred to above the Supreme Snark and the Supreme Gurdon, G. H. Grayson, took charge of the Scrivenoter's office, intending to continue until a competent man could be employed to take charge of the business of the Order. It was decided that hereafter the Srivenoter shall be elected to serve without salary and that a competent manager shall be employed by the Supreme Nine to handle the business of the Order under its supervision. The annual dues are to be increased to $3.65, effective on present members from September 9th next, and effective from date on all members hereafter initiated. It was also decided to make an immediate assessment of $2 per member payable at once, a step which was considered to be essential to a prompt restoration of the Order to a sound financial basis.

# Beaded Novelty Siding Duty Free

## United States Court of Customs Appeal Settles Disputed Point in Favor of Importers—The Court's Finding

The uncertainty which has prevailed for many months in regard to whether beaded novelty siding and ceiling lumber are liable to duty upon entry into the United States has been determined by a decision of the United States Court of Customs Appeals, affirming the decision of the Board of United States General Appraisers, and classifying these stocks as entitled to free entry. An extensive decision has been issued upon this question, which is worded in part as follows:—

The question is whether the beading which appears upon the ceiling lumber and upon some of the novelty siding serves to exclude the importation from proper classification as "not further manufactured than sawed, planed, and tongued and grooved," paragraph 647, Tariff Act of 1913. The planer and matcher used in dressing sawed boards is, in fact, simply a planing machine, and its work is simply planing, whether the boards are or are not beaded in the process. "Planing" includes beading, the beading giving the boards no new name, character or use. The free-entry clause applies.

The present merchandise consists of sawed and dressed boards which were imported under the tariff act of 1913.

The collector assessed the same with duty at the rate of 15 per cent. ad valorem under the provisions of paragraph 176 for manufactures of wood not specially provided for.

The importers filed their protest against the assessment, claiming free entry for the lumber as boards not further manufactured than sawed, planed and tongued and grooved under paragraph 647 of the Act.

The protest was submitted upon evidence of the Board of General Appraisers, and was sustained, from which decision the Government now appeals.

The two classes of boards were alike refused free entry under paragraph 647, supra, and were both assessed with duty as manufactures of wood under paragraph 176, supra. Nevertheless the court is advised that the Government does not contend for the assessment of the ordinary novelty siding, but limits its present claim to the beaded lumber alone.

According to the testimony, such lumber as is herein involved is first sawed into boards of suitable dimensions. The boards are then run through a machine which is called a planer and matcher. This machine operates four rotating cylinders each of which is equipped with certain cutting knives. The four cylinders are set in a rectangular position, and as the boards are fed into them the knives dress the four sides of the boards at the same time and by the same operation. The knives are removable from the cylinders; they come in many different shapes, which may be diversely adjusted therein. Therefore, as a board passes through the cylinders the two edges may be tongued and grooved or planed smooth, while at the same time the two sides may be planed entirely smooth, or partly smooth but with the cove effect and either with or without the bead effect. That is to say, it depends upon the adjustment of the knives upon the cylinders as to the form of the four surfaces of a board when it issues from the cutting cylinders, for the knives may be set to suit the various purposes of the operator. The operating machine is called a planer and matcher because of its four cutting cylinders, whereby the edges of boards are "matched" at the same time that the sides are dressed. The edges ar said to be "matched" whether they are planed perfectly smooth or are rabbetted, or are tongued and grooved. There is also a machine in common use called a "surfacer," having but two cutting cylinders by means of which only the two sides of the boards are dressed at a single operation. Such machines also may be adjusted so as to cut beads along the boards, but this would require considerable trouble and would be unusual in practice. Boards such as those now in question are practically always finished by means of the planer and matcher, that being the most speedy and economical process.

The record contains the testimony of twelve witnesses, all of whom were familiar with the processes which have just been described and familiar also with the terms in general use in the wholesale lumber trade in this country. The witnesses without exception testified that the planer and matcher above described is in fact simply a planing machine; that the work done by it is in fact simply planing, whether the boards be beaded or not; and that the word "planing" is uniformly used by the wholesale trade in this country as a generic term broad enough to comprehend all of the operations above described. This testimony in relation to trade usage was not designed to prove a peculiar commercial definition of the term "planing," but was submitted upon the claim that the trade usage of the term is identical with that which is adopted by common acceptation.

The decision then quotes the chief dictionaries as upholding this interpretation of the word "planing" and concludes as follows:—

It does not seem reasonable that the use of a beading knife in the planing process should alone deprive the boards in question of free entry under paragraph 647 and make them dutiable as manufactures

of wood not specifically provided for under paragraph 176. It is true that the beading process serves an ornamental purpose, but upon the other hand, the extended coves upon novelty siding are likewise ornamental in character, for such boards could well be fitted with rectangular joints. The beading of the boards seems to add nothing to their cost, nor does it give them a new name, character, or use. They are simply lumber which has been planed in a well-known manner and has not been advanced beyond the condition of planed boards.

# New Brunswick Crown Lands Report

## Increased Stumpage Dues Result in Record Revenue— Stringent Measures to Improve Operations

The annual report of the Department of Crown Lands of New Brunswick which was recently presented to the Legislature gives the following comparison of revenues received:—

| Royalties | 1913 | 1914 |
|---|---|---|
| Sales of Timber Licenses ... ... | $ 18.169.50 | $ 3,551.50 |
| Renewal of Timber Licenses ... | 81,236.00 | 81,292.00 |
| Stumpage ... ... ... ... ... ... | 305,818.62 | 385,624.64 |
| Transfers of Timber Licenses ... | 1,472.00 | 418.50 |
| Timber License Bonuses ... ... | 255,335.75 | 162,288.00 |

The revenue of the Department was the largest in its history, which was due to an increase in the stumpage, not to an increased cut. The report states that more extended explorations of timber lands will be made and that by 1917 a fairly comprehensive amount of information will be available as to the forest wealth of the province.

The Surveyor-General refers in the report to difficulties arising out of conflicts between settlers and licensees. Under an Order-in-Council the licenses was given one clear logging season to conduct his operations on these lots. At the end of this time, if the homesteader had not lived up to the requirements the lots would be restored to the licensee. This frequently caused disputes. Some applicants also for homesteads were found to have made considerable improvements, but not to be bona-fide residents on the lots applied for. In many cases they were removing pulpwood and other lumber without the payment of stumpage. The Surveyor-General suggests that a partial solution of the difficulty will be found in setting aside lands in different parts of the province in order to ascertain what sections are suitable for agriculture. When this is determined the lands thus selected should be set aside for agricultural purposes only.

The Surveyor-General points out also that a considerable quantity of the lumber cut was taken from lands that should have been reserved for a term of years, as the merchantable sized timber had been largely removed. Authority ought to be given to the Department to close out such lands for a set length of time. There were also large sections of Crown lands which had been held for many years without any operation being conducted upon them, resulting in serious loss to the province in stumpage dues. These lands are practically virgin forests and at present are largely inaccessible as the streams have not been cleared out in order to get the timber to market. Large quantities of spruce, fir and other timbers are dying annually on these lands. In some such cases the Department will make a demand for stumpage at the rate of 10,000 superficial feet per square mile as specified in the regulation. The report states that the outlook for the present season is on the whole encouraging although lumber values are still low and advances hard to obtain from the banks.

The report states that the Government intend to look carefully into the large quantity of pulpwood exported from the province. Referring to the continued cutting of undersized timber the report states that the Government intends to put an end to this by cancelling licenses of parties found guilty of this practice.

The season's cut of all classes of lumber was nearly identical in quantity as compared with the output of the preceding year, there being a difference of slightly over a million superficial feet less than the cut of the logging season of 1912-1913.

All of the timber licenses, with trifling exceptions, were renewed, but very few applications were made for new ground, showing that the remaining vacant areas are not considered valuable for lumber, and from the best information in the Department this vacant domain of about one million acres is largely barren, burnt and waste land.

### The Cut of Lumber

At the opening of the season it was thought the cut of lumber would not be up to the aggregate of the previous year, mainly on account of a dull market and an unfavorable wet Fall, but as the winter set in, better conditions prevailed, resulting in a substantial return from the scalers.

When the present pulp wood law was passed, the report says, prohibiting the export of pulp wood cut upon Crown Lands, it was hoped the papermaking industry would be brought into effect. I am sorry to report that no more mills are now making paper than were established when the law was pasesd, and I feel called upon to say with regret that large lumbering firms in this province are now, and have been since the law was passed, engaged in shipping wood of this kind out of the country, to build up industries elsewhere, and thus robbing the province of labor that properly belongs to us.

### Forest Fires

The province has been free from serious forest fires during the year, although in the latter part of May, and in the beginning of June many of these fires sprung up, and threatened destruction. Owing to the vigilance of the forest staff these fires were brought under control and happily suppressed. It is strongly advocated that a Lumberman's Fire Association be organized to work in conjunction with the Wardens of the Department, and there is no doubt in my mind that if such an Association was formed and properly conducted, the fire evil would be greatly reduced. I have only to refer to an Association of this kind that has been in existence for some years in the County of Westmoreland to show what can be done by co-operation.

During the year there were 33 forest fires in New Brunswick. Nineteen of these occurred during May and June. The total estimated area burned was 4,881 acres, 3,345 of which were Crown Lands. The estimated damage to Crown Land was $4,740. About 1,536 acres of private property and granted lands were destroyed at an approximate value of $4,688. The total cost of fire-fighting, of which a small portion was paid by lumbermen, was $1,352.81. It is interesting to note that the most destructive fire was one which broke out on July 11th at Blissfield and destroyed a large amount of private property. This fire was traced to the property of a Blissfield resident who was convicted for setting out fires contrary to law and was fined.

The report shows that 10,150 square miles of timber licenses were renewed during the year. These licenses had expired on August 31, 1914, and the renewal was at rate of $8 per square mile. Applications were received for 54 square miles of new licenses.

The following statement shows the quantities and kinds of lumber cut from Crown Land in New Brunswick, and the total stumpage for the year ended October 31, 1914.

| Quantity | Kinds of Lumber | Stumpage |
|---|---|---|
| 170,847,404 S. Ft. | Spruce and Pine Logs ... ... ... | $258.425.25 |

Hon. W. R. Ross, Minister of Lands for British Columbia, reports that the shingle industry of British Columbia is experiencing a very satisfactory revival. Orders are being received for British Columbia shingles from many points of the Canadian northwest, the middle west and eastern Canada. It is believed that the majority of the shingle mills in British Columbia will all be working again shortly. During the last twelve months, a large portion of the output from British Columbia shingle mills has been going into the United States, the only market which has been available. It is now felt that the improved demand from Canadian markets indicates an improvement in general business conditions.

The report of the commercial operation of the Panama Canal for the first six months up to February 14th, which has just been issued, states that the principal commodities passing through the Canal in order of their tonnage were as follows:—Grain, nitrates, coal, refined petroleum products, lumber, and cotton. These commodities together formed approximately one-third of all goods shipped through. Shipments of lumber amounted to 56,078 tons; all but 600 tons (from Gulfport to Panama) was from the west coast of North America. Of the 55,478 tons shipped from the west coast, all but 6,891 tons (from Nanaimo, British Columbia) was from Pacific ports of the United States.

A report from Vancouver, B.C., states that enquiries have recently been received by Vancouver manufacturers for prices on 60,000,000 feet of timber, including railway ties.

# Electricity in the Lumber Industry

## An Account of the Rapid Development of Electric Drive to Logging and Manufacturing Operations—Typical Installations Described

By E. F. Whitney*

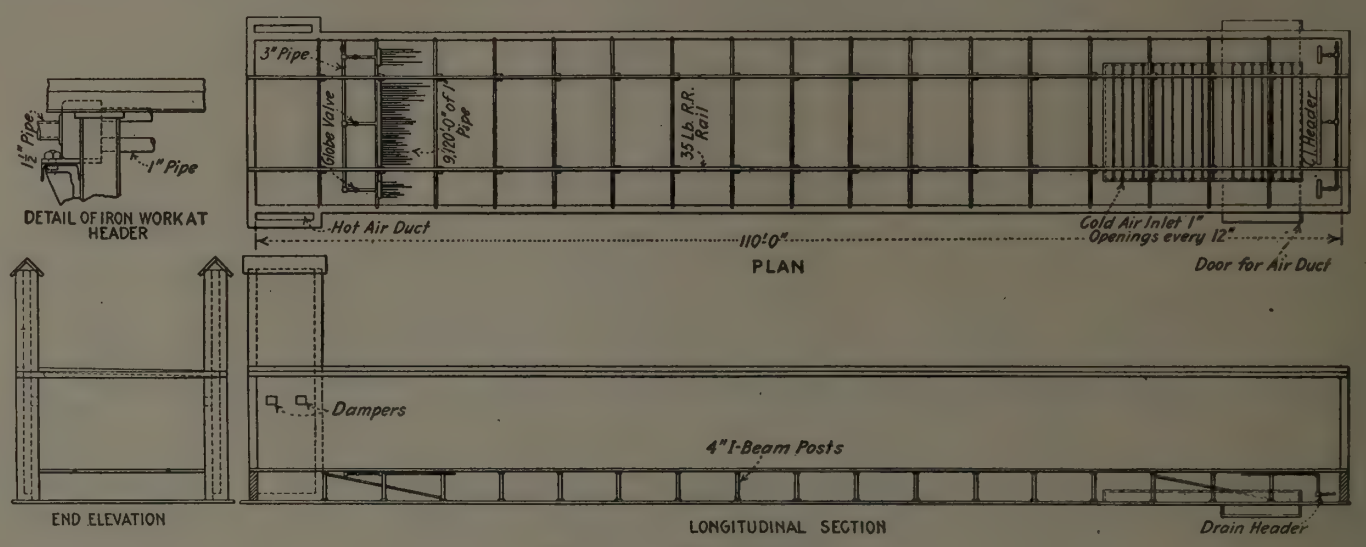

Fig 2—Dry Kiln Layout

In dealing with the use of electricity in the lumber industry, there will come under the first heading all that part of the manufacturing plant which converts the logs into timbers or boards, including all operations—from taking the log from the pond until the rough manufactured product is sorted into its various dimensions and lengths, ready for storage or further manufacturing. These operations may be divided into the following branches: handling the logs; sawing; trimming and sizing; disposing of refuse; sorting; storing or shipping.

In order that the sawmill operator may more profitably dispose of his better grade stock, a finishing mill is a necessity and in reality such a more or less completely equipped mill is always understood to be included in the general term "sawmill." The operations are so distinct, however, that it has been thought best to include the planing mill under a separate heading.

In those mills which finish a large portion of their product, there is between the sawmill and planing mill a seasoning process, which we will term "treating." This consists of artificially drying the product before finishing it. Its object is to get the material to its ultimate seasoned dimensions before the final manufacturing operation. Those operators who must overcome the handicap of high freight rates secure an additional advantage in eliminating all excess weight due to moisture. Some specialty mills (shingle mills, for instance) resort to drying solely for the purpose of reducing weight.

The treating process includes: stacking; drying; unstacking; sorting.

For economy of space the material must be stacked in some uniform manner; industrial type flat cars are generally employed, with mechanical means for loading the lumber upon these cars. With the old method of hand stacking, the capacity of two men per day seldom exceeded 10,000 ft. b.m., which is approximately 2,000 boards.

When the electrically operated stacker is used, the boards are taken directly from the sorting chain and two men can care for from 45,000 to 50,000 ft. per day. The lifting arm of this equipment, which lifts each stock in position, together with a short section of the conveyor table, is operated by a 7½ h.p. motor, belted to a line shaft and

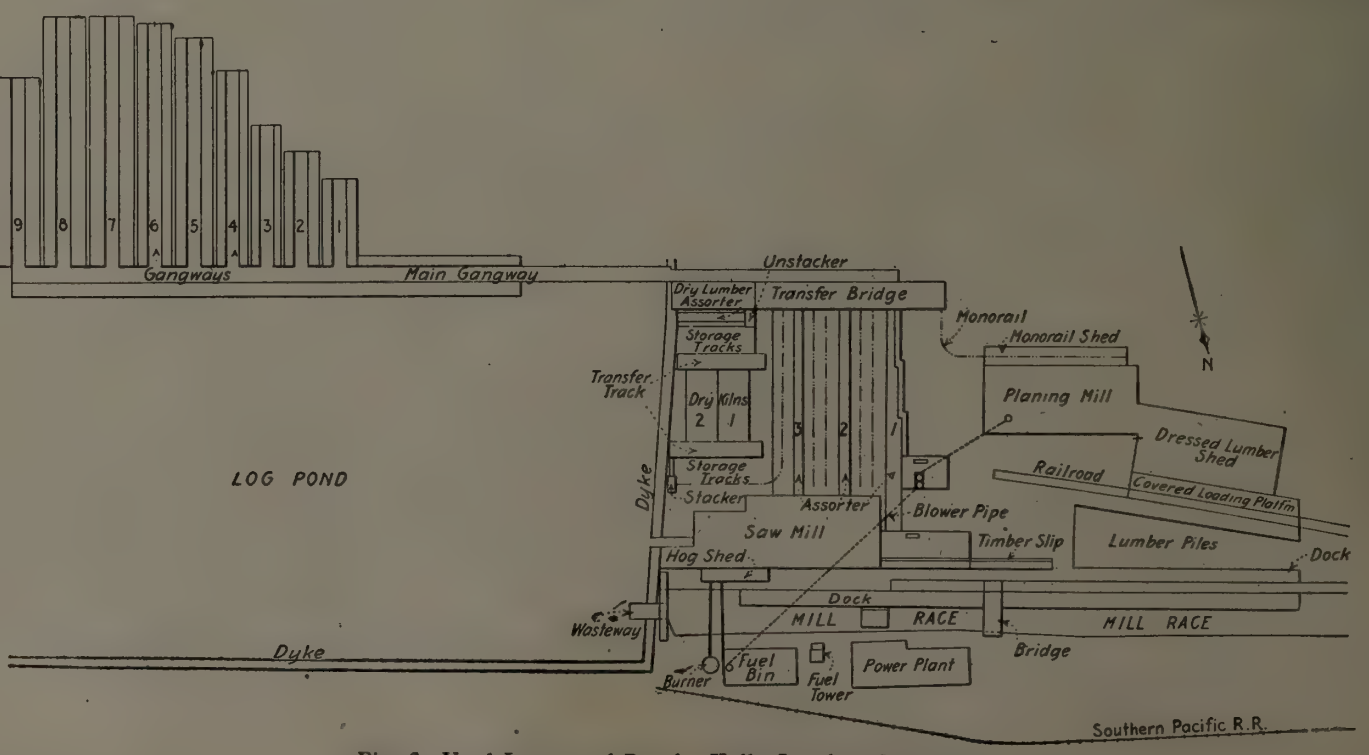

Fig. 3—Yard Layout of Booth—Kelly Lumber Company.

Fig. 4—Log Saw on Log Deck in Mill. Control for Log Haul and Conveyor Chains Shown at Right.

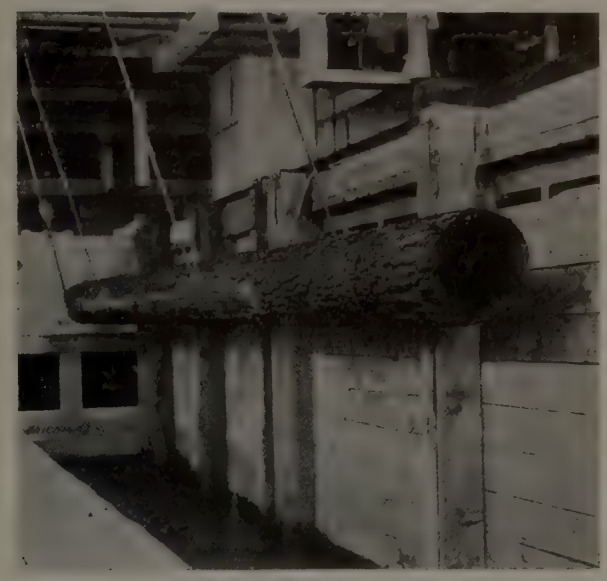

Fig. 5—Log Lift with Log at Half Elevation.

running continuously. The load factor is not more than 5 per cent. The peak when lifting the arm is approximately 12 h.p., while running the mechanism light requires 2 h.p.

The dry kilns universally follow the old principle of steam radiator construction. The steam legs of the radiator are made up of a large number of small pipes, one in. (2.54 cm.) to 1½ in. (3.81 cm.) in diameter, which run the length of the kiln and connect to steam exhaust headers at the end. A typical dry kiln layout is shown in Fig. 2. It is common practise to admit high-pressure steam directly to the pipe. Of late years the vacuum system, taking exhaust from the mill engines at 5 to 30 b. (2.2 to 13.6 kg.) gauge and exhausting into 20 to 25-in. (50.8 to 63.5 cm.) vacuum, has come into rather general use. Where high pressure steam is used directly, a reducing valve which cuts the pressure to approximately 50 lb. gauge is ordinarily inserted.

It requires about 72 hours for drying planing mill stock, and six days for drying bundles of shingles. After the kiln has once reached a constant temperature approximately 1,000 lb. (453.5 kg.) of steam per hour are required by the average kiln.

In green lumber, 30 per cent. to 40 per cent. of the weight is moisture. The dry-kiln operation reduces this to from 6 per cent. to 10 per cent. after drying. The process is not carried further as there is no necessity of furnishing lumber drier than the air at the locality in which it is to be used.

After drying, the lumber is unstacked and distributed to the finishing machines. The scheme for unstacking edge-piled lumber in most common use consists of an endess chain with hooks spaced about 10 ft. apart, running in vertical guides, these guides at the top being curved to direct the boards on to a transfer table, from which it goes to the sorting table and is classified and taken to the finishing machines. This unstacking device is driven by a 5 h.p. constant-speed motor and requires approximately 4 h.p. while lifting the stack and 1¾ h.p. running the lifting and conveying chains only. Its unloading capacity is approximately 60,000 ft. b.m. per day.

### Planing Mill

Operations in this mill consist of planing or finishing the stock, trimming, disposing of refuse, sorting, tying or bundling, and storing or shipping.

The product of this mill comprises the highest grade lumber and is consequently given close attention.

Before planing, it is often necessary to do a small amount of resaw work, but this is of a very light character, its purpose being to re-manufacture yard stock to supply the accumulation of orders for any one size of lumber. The refuse from this mill is the best fuel supply, since it is thoroughly dry.

Specialty mills are often valuable adjuncts in utilizing materials which would otherwise be thrown away as refuse. Very often they have no connection whatever with sawmills and must purchase their material in the open market. In the following, therefore, we have considered only those specialty mills which have a direct connection with sawmills.

### Lath Mills

Lath mills are always run in connection with sawmills and obtain their material from slabs and edgings which would otherwise go to the refuse burner or, at best, to the wood bins. The slabs are taken from the main refuse conveyor and go through the following processes; bolter; lath machine; trimming; bundling.

Bolting consists of sizing the slab to the dimensions necessary for putting through the lath mill. The bolter may consist of a number of saws, therefore making several bolts at one operation, and requires about 7½ h.p. per saw.

The lath mill consists of three saws, making four laths of each bolt, and requires approximately 25 h.p. The laths are then trimmed to 4 ft. (1.21 m.) lengths and tied in bundles of 50 or 100, after which they are ready for storage or shipment.

### Saw Mills

In saw mill operations the work consists essentially in manufac-

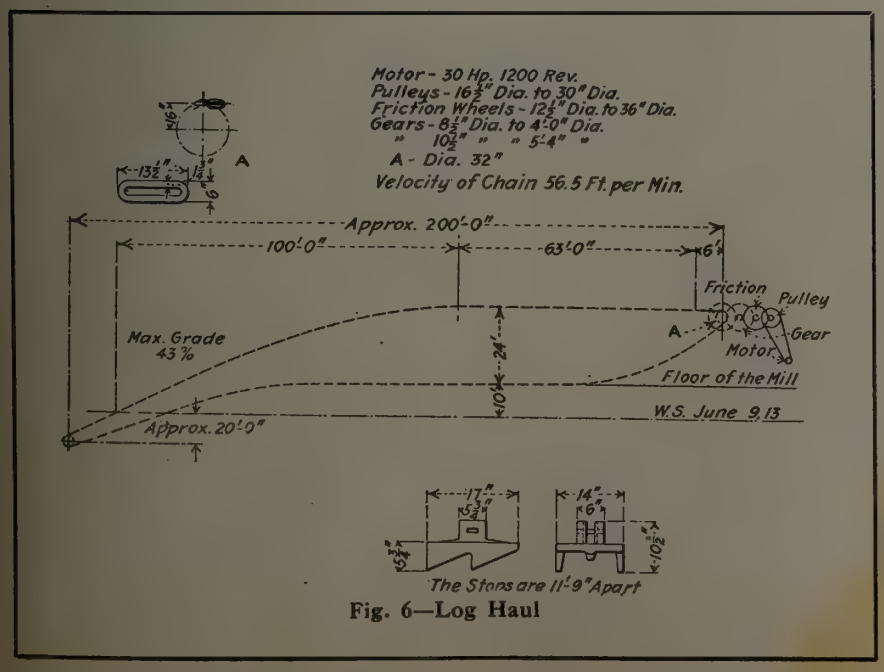

Fig. 6—Log Haul

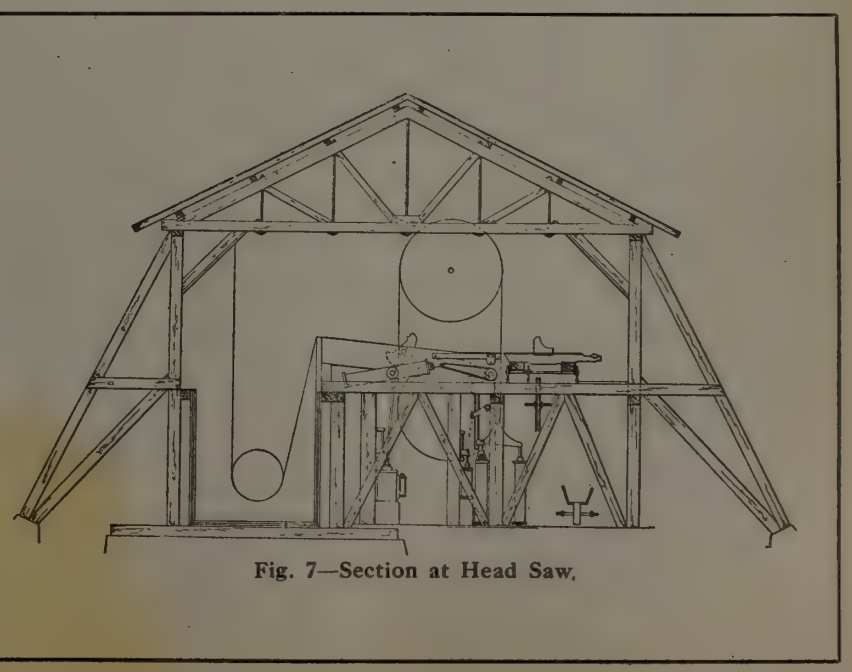

Fig. 7—Section at Head Saw.

turing a log to boards or timbers of a certain thickness, width and length, so in its elementary form only three machines to perform these functions are necessary. In the following, therefore, we will follow the progress of the work through the mill in its simplest form, afterwards returning to the auxiliary machines which have come as a natural result to increase production by performing some of the elementary functions faster or with greater facility than could be done with only the major machines.

In driving the mill machinery, squirrel cage motors are used wherever possible, because of their simplicity and strength. Unless specifically noted to the contrary, it will be understood that constant-speed, alternating-current induction motors are referred to. Practically all of the work is at constant speed, and in fact in sawing operations this of prime importance. In the first installations, individual drive for each device or machine was used without question, thus, at one step, past practise with line shaft and belting, with all group drives, was entirely reversed in an endeavor to do away with shafts, belts and transmission machinery entirely. To-day, semi-group drive is standard. All parts which work to the same end and are close together, are grouped. Groups usually embrace such devices as transfer rolls, transfer chains, conveyors, etc., which require a certain amount of transmission machinery in any event, and which require practically the same power when running idle as when working. The milling machines themselves are individually driven.

The power demands of the machines fluctuate so that it is practically impossible to plan for other than the maximum demand which might be encountered. For instance, an edger may run on narrow material with two saws cutting a two-in. board, and within five minutes, the same machinery may be called upon to handle a 6-in. (15.24 cm.) to 12-in. (30.48 vm.) cant, requiring four or five working saws, taking in the first place approximately 40 h.p. and in the second place 350 h.p.

In the following, wherever load factor is given, it is taken as load factor based upon the time of a working day. Some mills operate 24 hours, while others run 10 hours, and it is therefore obvious that unless the actual working time for each day is taken, the data will not apply universally.

Fig. 3 gives the general plant and yard scheme of a modern Pacific Coast mill. The logs as delivered to the pond are of various lengths and sometimes must be cut to accommodate the mill layout. This operation is performed more often when the logs are still in the water, but is sometimes done after they have been lifted to the log deck. Fig. 4 shows the saw used in the latter way. The driving motor is a squirrel cage type, 10 h.p., and is run intermittently. Its load factor is not greater than 6 to 7 per cent.

### Log Lift

The logs are carried from the pond either by the old arched log haul, or by the later log lift (Fig. 5). In the first case an endless chain with hooks spaced several feet apart runs in a groove in the arched log haul structure, at a speed of approximately 50 ft. (15.25 m.) per minute. The driving sprocket is driven by a constant-speed squirrel cage induction motor of about 35 h.p., through the necessary speed-reducing transmission machinery. See Fig. 6. The motor runs continuously and the load is thrown on or off by the friction device. The log lift is coming into more general use, because of the upkeep expense of the older scheme of log haul.

A canal leading from the log pond is built into the head end of the mill, paralleling the log deck. Cables are attached to the edge of the log deck and fixed to hoisting drums overhead, allowing the loop to fall below the surface of the water in the canal. The logs are floated in and then hoisted, the natural angle of the cable as it becomes taut at the end of travel rolling the logs on the deck. An intermittent-duty hoist-motor, with reversible controller, drives the mechanism. The average load hoisted is is 1,500 ft. b.m., weighing approximately 12,000 lb. (5,443 kg.). The maximum will hardly exceed 6,000 ft. b.m., weighing approximately 48,000 lb. (21,772 kg.).

The rate of hoisting with a maximum load is about 40 ft. (12.1 m.) per minute; length of hoist 10 to 35 ft. (3.05 to 10.76 m.). Common practise requires 37 to 52 h.p., depending upon the character of the logs handled. The load factor is approximately 6 per cent. See Fig. 7, showing a cross-section of the head end of a sawmill at the head saw.

The duty of the log carriage is very severe, as may be noted from the following typical cycle:

| | |
|---|---|
| Average speed during cut | 250 ft. per min. (86.25 m.) |
| Average speed of return ( assuming single cutting mill) | 650 ft. per min. (198.25 m.) |
| Total distance of travel one direction | 20 to 60 ft. (6.1 to 18.3 m.) |
| Average weight of carriage and log of 1,500 ft. b.m. | 38,000 lb. ( 17,237 kg.) |
| Maximum speed during cut | 350 ft. per min. (106.75 m.) |
| Minimum speed during cut | 100 ft. per min. (30.5 m.) |

From these we see that the retardation at the end of travel and the acceleration of return must be at very high rates in order to lose a minimum of productive time.

The adjuncts of a log deck, viz.: "kickers" and "niggers," used for turning the logs and pushing them on the carriage, as well as the log carriage itself, are usually steam-operated. These devices are uneconomical steam users, but their demands are not very great and they are very seldom a source of additional cost in boiler plant capacity.

The log after each cut must be moved up a definite amount in preparation for the next cycle. This is accomplished by the set works. A five h.p. constant-speed induction motor mounted on the carriage and running continuously provides the simplest means of driving this device.

With direct current available, a series motor will prove more economical in energy consumption and will run only when the set works is operating. Current is collected from protected trolleys or from a loop cable supported by rings carried on a rod attached to the side of the building. A back-geared motor on a rod fitted with silent chain drive proves most compact. The control mechanism must be arranged for reversing operation.

The canting gear, usually driven by a 15 h.p., constant-speed motor, is required only when a very irregularly shaped log is encountered. It consists simply of a drum with attached hook and cable for turning the log on the carriage. This operation is now performed by power machinery in all except the most extreme cases. The motor operates so intermittently that its energy and power requirements are of little interest.

(To be Continued.)

## The Uses of Hemlock

A bulletin recently issued by the United States Forest Service gives interesting information regarding eastern hemlock and its use for lumber and for pulp.

Hemlock, the bulletin states, has been lumbered for only a comparatively short time as compared with pine, but this exploitation, with waste and fire, has already greatly reduced the supply. If the present rate of destruction and use continues hemlock will before long be as scarce as old growth pine. Although of present importance, hemlock is not a tree of promise for forest planting, as white and red pine will yield better lumber in a much shorter time and on poorer soils and are less susceptible to decay and more easily grown. Spruce serves as well for the protection of watersheds and stream sources and produces better pulpwood and lumber. Hemlock is found in the New England states, New York, Michigan, Wisconsin, Pennsylvania, West Virginia and scattering in North Carolina and Kentucky, in the white pine region. About two-thirds of the total cut of eastern hemlock lumber in the United States comes from Wisconsin, Michigan, and Pennsylvania, in the order named, with West Virginia, New York, and Maine following. The other states within its range aggregate about 11 per cent. The stumpage value of hemlock is generally lower than that of the other important eastern trees. White and red pine, white ash, basswood, elm, oak, and hickory all considerably excel it.

Though hemlock first came into use because of the growing scarcity and increasing value of better trees, it can no longer be considered merely as a substitute for these species. In the three large industries to which it contributes—lumber, pulp, and bark—it has become practically indispensable. Small quantities of hemlock lumber were produced locally in the northeast during the early days, but not until the bulk of the pine had gone was it able to find a wider market. As long as the best grades of pine lumber could be had for very little more than the cost of production, hemlock could not be disposed of profitably. During the last five years hemlock has ranked fifth in importance among the lumber trees of the United States, being exceeded only by yellow pine, Douglas fir, white pine, and oak. In 1905 hemlock formed 11.8 per cent. of all the wood used for pulp. In 1906 and 1907 it supplied 14 per cent. of the total amount; in 1908, 17 per cent.; in 1909, 14 per cent.; and in 1910, 15 per cent. During the latter year its consumption was 50 per cent. greater than in 1908.

Hemlock pulp is used for news, wrapping, and other cheap grades of paper, and is manufactured chiefly by the sulphite process. In this process the wood is first chipped and then cooked in a solution of calcium sulphite, which frees the fibres by dissolving the substances that unite them. The dissolved substances comprise about half the original weight of the dry wood, without bark. Hemlock also furnishes a small amount of ground wood pulp, but the great bulk of this is spruce. Hemlock bark has been used in tanning practically ever since the beginning of the industry in America. Oak bark is softer, more pliable, and less permeable to water than does hemlock; but there is not as much of it, and for many years its annual consumption in tanning has been less than half that of hemlock. With the introduction of tanning extracts, hemlock and oak were the first native species to be used, but after the process by which extract could be made from chestnut wood was perfected, about 1900, the latter species became the leading source of supply.

# The Reader's Viewpoint on Trade Topics

## Balsam Fir an Excellent Wood for Box Material—Wholesaler Sounds Warning Regarding Prices After the War

**Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—**

### Balsam Fir a Good Box Material

Editor Canada Lumberman: Sault Ste. Marie, Ont., March 8th.

You have a query in your March 1st issue under the head of "Who Can Furnish Cheap Box Lumber for England."

I think that a few remarks on one of our native woods, little known outside of this country and some states of the American Union might be of assistance and interest to your "English Importer" as well as others.

The Balsam Fir (Abies Balsamea), commonly called "Balsam" by English-speaking, and "Spain" by French-speaking lumbermen, is essentially a Canadian tree, although it does not cross the Rocky Mountains, and its distribution extends into the Northern Lake States, New England, and the Allegheny foot hills.

The wood of this tree is very valuable for just the purpose of your enquiry; in fact there is none that can compete with it for food boxes, and it is probably the cheapest wood in the market to-day. When it is seasoned it loses 50 per cent. of its original weight, which is about 50 pounds per cubic foot green, 35 pounds half seasoned, and 24 pounds absolutely dry. It is thus lighter, and it is softer, than spruce. It is not quite so strong, but for box material it is sufficiently so. After a little seasoning it will hold nails well, and will not warp like spruce. Its special value, however, lies in the fact that it is tasteless, and will not taint foods; thus for sugar and fish barrels, butter boxes, cheese box heads, etc., it is the very best. This is doubtless due to the fact that it is not a gummy wood, contrary to the popular impression. The actual resin content is less than that of spruce, and it is one of the few conifers that lack resin ducts entirely. There are many uses that this wood can be put to, such as house sheathing, laths, fiddle tops, toys, etc., which need not be mentioned here.

This tree has been looked upon by many as almost a weed tree, useful only for first cover in reforestation. It has increased in proportion to other conifers in our forests, largely owing to the fact that it was left when the more valuable, pine, spruce and other trees were cut. Unfortunately trees of this species growing on side hills, if deprived of a proper water supply are defective and partly rotten, so that quite a percentage of certain stands of fir are not suitable for lumber, but a good many defects are permissible in rough crate shooks, and the knots are generally small and sound. By thus using the lower grades there is little loss in manufacturing this wood.

Fir is also good for paper pulp, but should be treated separately for this purpose, whether the pulp is ground or chemically made, and it should not, during the process, be mixed with spruce. The yield of fibre averages about two-thirds of that of spruce, and is the same average length as black spruce (picea brerifolia). It is however, only three-quarters the length of the fibres of the white and red spruce.

The gum obtained from the vesicles in the outer bark of this tree is called "Canada Balsam." All trees of this species do not produce this gum, nor is the collecting of it a pleasant or cleanly occupation in fly time, although profitable; each vesicle having to be pierced with the spout of a small tin can like a minature teapot, held by a man or boy climbing the tree for that purpose. The smudge fires of "Les Gommeurs" of the Province of Quebec have often been an extra care to the fire wardens.

A stand of "Balsam Fir" grows rapidly, and is mature after one hundred years or less, and produces under varying circumstances, in natural stands, from ten to forty cubic feet of wood per acre per annum. These trees grow, according to the district and other conditions, from fifty to eighty feet in height, and sometimes even longer. The diameter for the largest trees, breast high, would probably not be more than eighteen inches. A fifty-foot tree would usually be twelve inches in diameter, breast high. Thinings are necessary during the growth of the stand, are profitable, and can be used for many purposes making among other things good fence rails if peeled.

Surely this tree is worthy of further investigation by owners of forest tracts, lumbermen and food packers, as well as others.—W. J. V. Atkinson, Forester.

### Good Prices Whether War Ends Early or Late

Editor Canada Lumberman: Montreal, March 16th.

Boats! Boats! Boats! The "Bugaboo" of the Canadian lumber exporter. If we can't get them what happens to the lumber market? Prices have hardly ever been higher, but at the present time it is impossible to get space on the liners. Some of the concerns are offering deck space for next month, but all of it could not take care of 10 per cent. of the lumber shipments offering.

All kinds of boats, tramps and schooners are being requisitioned, and as the high freight rate existing of 125 shillings looms big on the horizon for boat owners, there will be, no doubt, great impetus in buying up or repairing obsolete affairs, and building new.

In spite of the high freights and the advanced price of lumber on this side, the European market is not as high comparatively, and this leads to a great deal of speculation.

Will the war last throughout the year, or will it come to an end with the summer months, as many seem to think? The contraband war England has declared will, no doubt, bring Germany and Austria to their knees, but they are a stubborn race and will suffer all kinds of hardships including starvation before giving in. With their own resources they can keep up for a long time yet.

There is no question at all of England's and France's requirements in lumber, and if any boats at all can be had, the seller will get his price, which he seems to be determined to get.

Cuts of deals running 60 per cent. sevens and eights, and 40 per cent. nines and up are now offering at $22, with many takers, at St. John, and Halifax, and there have been many turn-overs of two and three hundred thousand feet at $22.50. Some of the mill people say they will not move a stick of such lumber under $26, and it would look as if the market will be disproportionately high.

Of course, there is always the "little fellow" who is ready to cut the market and thinks he is doing a great stunt when he sells deals at $18, that he can easily get $22 for. Then he struts around and tells you that he knows all about the export market and that prices are very normal, and will no doubt drop.

But we are dealing with a "white man" proposition, where the mills ought to and will bet "value" for their lumber, instead of a mere turnover, that great discouraging element in lumber manufacturing. Present and future prices are only a fair return for the years of low and discouraging markets, that we have felt, and it is time to stick together and benefit by a little opportunity of laying a few dollars aside for the future rainy day, which declining years always bring us to.

On the other hand, supposing the war ends quickly. There will be a veritable landslide in prices, UNLESS WE KEEP OUR HEADS. In that event, there is all the more reason why prices should maintain themselves high.

Optimism is only long-headedness—the far-seeing policy of the modern operator, and even if we tie our deals to aeroplanes we'll get them to England somehow.

Keep your heads, and you need not fear any drop, but confidently count on right good prices, whether the war comes to end early or late.

J. Henry Poulin, Sales Manager,
Canada Lumber Sales Company, Limited, Montreal.

### Some Lumber Problems

One of the best conventions that have been held this year by lumber associations was the sixth annual meeting of the Northern Hemlock and Hardwood Manufacturers' Association, held recently at Milwaukee, Wis. The proceedings of the meeting have been issued in book form under the title of "Some Lumber Problems." In addition to the reports presented by officers of the association, the book contains all of the excellent and practical addresses which were delivered. One of the most interesting of these, from a Canadian point of view, was an address delivered by Enos Colburn, on "Birch for Interior Finish," which is reproduced elsewhere in this issue. The address of the secretary, Mr. R. S. Kellogg, upon "Some Troubles of the Lumber Industry," was also practical and timely. Some of Mr. Kellogg's conclusions are also reproduced in this issue. Among the other important addresses were the following:—"Camp Missionary Work," by Matt. Daly; "Lumber for Factory Trade," by W. W. Brown; "Better Business Methods," by Edward Hines, and "Cost of Carrying Timber," by C. H. Worcester. These are all included in the printed report and form a book which will be available to all lumbermen. Copies may be had from the Assistant Secretary, Mr. O. A. King, Wausau, Wis., the price being 50 cents each.

# Will Develop Shipping Facilities

## B. C. Government Taking Steps to Encourage Adequate Provision for Exporting Lumber to Foreign Markets

In the March 15th issue of the Canada Lumberman a report was published in regard to the proposal to send Mr. H. R. MacMillan, Chief Forester for British Columbia to Australia, to enquire into the market for Canadian lumber. In this connection it is interesting to note that Hon. W. R. Ross, Minister of Lands, recently made an announcement in the British Columbia Legislature upon this subject. In moving the second reading of the bill to amend the Forest Act, Hon. Mr. Ross gave an interesting review of the lumber industry in British Columbia and said that there was included in the estimates a sum not less than $50,000 to be used largely in an effort to secure shipping facilities or to promote the general object of extending materially the export lumber trade of British Columbia. Ship subsidies, in some form, the Minister said would be given to promote this purpose. The co-operation of the Dominion Government had been secured in the campaign which had been launched and Mr. H. R. MacMillan had been invited by the Department of Trade and Commerce to visit Australia and investigate every aspect of the problem of marketing Canadian lumber in that country. Mr. MacMillan had asked for leave of absence in order to undertake this work and the British Columbia Government had readily complied with this request. Hon. Mr. Ross said that the selection of Mr. MacMillan for this important duty had met with the unanimous approval of the lumbermen and had also been recommended by the Victoria Board of Trade. He paid a generous tribute to Mr. MacMillan's ability, saying that he was by all odds the best man available for the position.

"If we find, as a result of this investigation" said Hon. Mr. Ross, "that other action by this Government is necessary in the work of breaking into foreign lumber markets, then this Government will follow up the matter vigorously. The province once controlled one-third of the lumber export trade with Australia; it now handles only 5 per cent. of it. Rest assured that the Government is determined to do away with that unnatural situation. Futrher development of our timber resources depends entirely upon the wider markets into which our lumbermen are striving to push their way. It has now become the duty and business of the Governments to undertake the second stage of the programme and to give practical assistance to the marketing of timber. Payrolls, profits and public revenue alike depend upon the energy with which this broader policy is followed up.

"Consider for a moment how the export trade from the Northwest of this continent is shared at present. There was a time when British Columbia shipped 80,000,000 feet a year across the sea. Of late years our exports have shrunk to 35,000,000, while Washington and Oregon have been developing an ocean-borne trade of 700,000,000.

"We have, as the saying is, been backed almost off the map in nearly every market except one. The two states to the south of us control nearly all the timber shipments to Australia and over four-fifths of the business in Japan and China. United States mills provide ninety per cent. of the lumber supplied to South America, Great Britain and Europe from this continent. Only in South Africa has British Columbia secured and retained a market, and that solitary achievement has been due to a special reason—the tariff preference that South Africa has granted us. Now it is perfectly plain that this lack of success in foreign markets is out of all proportion to the very solid asset in the way of timber that British Columbia possesses. We have the timber and the mills to manufacture it. By every commercial test the province is entitled to play an important part in the world's trade in lumber. We are not doing so. Something is wrong somewhere. What is it?

"Complaints have been made that our lumbermen are to blame for the present situation: that they are not aggressive in pushing into the export market; that British Columbia timber is, therefore, unknown abroad. But investigation by trade commissioners in foreign countries show that this is not correct, for the reputation of British Columbia lumber stands high in many distant markets, and I am in a position to know that the greatest courage and persistency has been shown by local firms in seeking orders.

### Need of Vessels

"The timber is here, the mills are here, but we can not export our manufactured lumber. Why is this? The reason lies in a nutshell—we can not get the ships. Take as an instance a recent order from the Australian Government. Our mills are prepared to fill that order at once and at the lowest market price. That piece of business is ours by every right. But our mills can not touch it because there are no ships at their disposal; even though shipment after shipment of lumber to Australia is being made at the present time from California, Washington and Oregon. We can only deal with the sister Dominions of the empire through the agency and by the favor of American brokers, American lumber buyers, American shipping companies. I speak about our cousins across the line in no unfriendly spirit. Their competition with us is straightforward business. But naturally, they exercise their legitimate privilege of swinging business to their own people; and therefore the shipping and selling monopoly they have established in the export lumber business has become a lid that stifles the export trade of this province. When orders from other portions of the British Empire—from Australia, India, the United Kingdom—are subcontracted to British Columbia mills by San Francisco brokers, instead of being received direct; when other orders from the empire are filled on the American side without our even hearing of them; when, after strenuous efforts, our mills secure the chance of tendering on a few orders and find themselves condemned to let every one go past them to American mills because they can not get a single ship—well—in such untoward circumstances it is time for us to get busy and do something drastic to secure this trade that rightfully belongs to us.

"Transportation is what is needed. Already this Government has devoted itself heart and soul to providing transportation inland from the coast. The new transcontinental railways provide for that effectively. At the point where our wealth of timber and our splendid manufacturing equipment is made of no effect because it can not reach its markets—at the seacoast where transportation fails of a sudden, leaving our coast mills congested with millions of dollars' worth of lumber they can not ship—at this point it is the duty of this Government to extend the work it has been doing, and to secure transportation seaward for our lumbering industry."

Concluding, Hon. Mr. Ross referred to the lumber interests of the interior, and promised progressive measures for pushing the trade of the mountain mills in their legitimate markets, the prairie provinces of the Middle West.

---

## B. C. Introducing a Workmen's Compensation Bill

A Workmen's Compensation Bill, which for all practical purposes is a duplicate of the act now in force in Ontario, has been introduced in the British Columbia Legislature by the Attorney-General. According to the draft form of the measure provision is made for an administrative board consisting of only one commissioner. The Canadian Manufacturers' Association who have been notified of the proposed measure, have written to the Government suggesting that the act be not put into force for a year or two, until it is seen how the Ontario Act works out.

---

At a recent meeting of the Board of Trade at Grand Forks, B.C., a resolution was passed endorsing a resolution previously passed by the Mountain Lumbermen's Association, urging the Federal Government to impose an import tax of $2 per thousand feet upon lumber entering Canada, and to enforce the dumping clause in the act so as to prevent United States lumber from being sold in Canada at lower prices than those which are obtained for it in the United States.

---

M. G. Buckley, general manager of the Canadian Lumber Yards Limited, with headquarters at Winnipeg, and W. J. Schusler, travelling superintendent of the company's yards, entertained the managers of the company's yards in the Swift Current district at a banquet in the Empress Hotel recently.

### Advertising That Pulls Business

Fort Frances, Ont., March 6th, 1915

Canada Lumberman & Woodworker:

Considering conditions in the lumbering business for the past few months, we feel that we were very fortunate to receive sufficient orders to keep our plant running full capacity during the winter months.

While our success is greatly due to the satisfactory operations of machines already in service, we also feel that **the advertisement in your magazine has been instrumental in leading up to these orders, as we receive inquiries daily from this source.**

It will perhaps be of interest to you to learn that we have just delivered a Shaw Motor Headworks to the Lakes Timber Company, Limited, which is to be used in their logging operations this season. This company have previously been using a steam tug for this work, but after watching the performance of our warping tug the past year, realized that they could reduce their operating expenses and handle their work to better advantage in every way, so have decided to lay up the steam tug indefinitely.

We might also mention that we are now completing another boat to be delivered in about ten days.

Yours very truly,

Russel Bros.

# Ocean Transportation the Key-Note

## Sir Richard McBride Says Dominion Government Should Consider Subsidizing Steamships

One of the most important of the regular meetings of the Victorio, B.C., Board of Trade was held recently, and a lengthy discusasion took place in regard to the lumber trade situation. Mr. C. H. Lugrin, vice-president occupied the chair and gave an address upon the work which had been carried out by the lumber committee of the board. The lumber committee had been formed he said, to enquire into the possibility of establishing on a firmer footing the export lumber trade with Australia and India in particular. The first step taken had been to make representations to the Provincial Government in regard to the demand for timber from India. The committee had next taken up with Sir Geo. E. Foster the question of securing reciprocal trade arrangements with Australia. Mr. Lurgin gave a brief outline of the negotiations conducted with Sir Geo. E. Foster in this connection which had resulted in the nomination of Mr. H. R. MacMillan of the Forest Branch as a trade commissioner to visit Australia on behalf of the Canadian Government.

Interesting addresses were also delivered by Sir Richard McBride, premier of British Columbia, Hon. W. R. Ross, Minister of Lands, E. J. Palmer, manager of the Victoria Lumber and Manufacturing Company, Chemainus, B.C., and J. O. Cameron, Cameron Lumber Company, Victoria, B.C. Each of the speakers emphasized the great importance of securing reciprocal trade arrangements with Australia and expressed a belief that once such an arrangement had been reached the lumber industry of British Columbia would be greatly improved.

Mr. E. J. Palmer gave an interesting survey of the situation, which included much valuable information. He considered that the cause of the present depression in the lumber trade was indiscriminate over-production in the face of a steadily decreasing per capita consumption owing to the steady inroads of substitutes and lack of combined effort to exploit British Columbia woods. Mr. Palmer laid emphasis on the disastrous competition with Canadian mills offered by United States mills, which, on account of their long establishment were able to carry on the export trade more efficiently. In conclusion Mr. Palmer dwelt at some length on the importance of securing better ocean transportation for British Columbia lumber. He thought that some of the German vessels condemned in Australia might be utilized in this trade. The chief obstacle in the way of operating the lumber business successfully in British Columbia was undoubtedly lack of sufficient ocean transportation facilities.

Sir Richard McBride said that the welfare of the British Columbia lumbering industry was a vital matter and nothing should be left undone that would tend to promote its welfare and to develop its over-seas trade. He referred at some length to the unfortunate lack of transportation facilities for shipping lumber to Australia and cited a case in which an arrangement had been completed to despatch an extensive and important shipment, when it had been discovered that there was no vessel to carry the cargo. This shipment would have attracted considerable attention to the province's timber if it had been carried out with delay. He said that the power and authority to improve this situation rested only with the Dominion Government and that the Government could consider advantageously a proposal for subsidizing steamship companies for the purpose of this trade. "If it is possible," he said, "for our vessels to carry lumber, pulp and paper to Australia and elsewhere, a vigorous campaign should be taken up to give British Columbia what she is entitled to, and we must bestir ourselves to secure the markets that are naturally ours."

Sir Richard pointed out that the reports of activity in the trade amounted to nothing unless the millions of dollars invested in the industry could bring forth profitable results. During the last two years the lumbermen had been hanging on until the arrival of better times, and they were now at the extreme end of their patience in looking for some remedy to assist in the betterment of conditions. There was three or four times as much money invested in the lumber business as in any other industry in the Province, said Sir Richard, and every dollar must earn a profit if prosperity was to be assured.

"When the mills are all in operation 70 per cent. of the pay-roll of the province is made up from the lumber business and its allied industries. Its prosperity affects practically every family of the community. The present depression has made us seek economy in all things and search out the trade routes that we should not investigate otherwise. We have lost neither our faith nor courage, and we shall emerge from this crisis all the stronger."

The Hon. W. R. Ross, Minister of Lands, stated that, while the lack of shipping which was being felt so seriously at the present time was caused very largely by war conditions, a great deal of it was due to the effect that American concerns had upon Canadian shipping. Time after time orders to Canadian mills had been given to American establishments because, on account of their longer organizations, they were better able to handle them. There had been hopeful signs already of the widespread foreign trade British Columbia would be able to carry on once the necessary shipping had been secured. "I am very glad," he said, "to have been able to give official assistance in starting what will develop in a few years into a flourishing trade with India and the East." The Minister called attention to the possible creation of a new industry by manufacturing creosote, an important by-product of coal. The main feature of the situation, in his opinion, was that British Columbia had got past the stage of talking and had really begun to do things. "With preferential tariff within the Empire and with a steady flow of shipping to and from our ports, the lumber industry of this coast will come into its own, and the reviving effects of its prosperity will be shared by every industry."

Mr. J. O. Cameron referred at some length to the inconvenience and loss of money due to the lack of steamships and the high rates of charter asked by the vessels that were available. He was of the opinion that New York would furnish a good market for British Columbia lumber and that by the completion of the Panama Canal another outlet for the trade had been created.

Mr. Chamberlain briefly described what was being done by the Lands Department in the matter of publicity by circulating samples and information. Mr. Griffiths contrasted the lumber industry as carried on in the East with the manner in which it was operated in the West, and he thought that the Eastern methods could be adopted with advantage. Mr. Palmer moved a resolution asking the Dominion Government to increase the base value of lumber from $7.50 to $10 per 1,000 feet in fixing the duty.

---

## Birch For Interior Finish

**By Enos Colburn***

*An address recently delivered before the Northern Hemlock and Hardwood Manufacturers' Association.

As I stated last summer, you manufacturers are spending considerable money in advertising lumber and its products, especially birch as an interior finish. I am connected with an interior finish mill, where we come in contact with other woods for finish. We find that you are not putting up birch so it will work to advantage to such mills. I believe that you manufacturers should put up some of your birch in a dimension size or in some grade suitable, same as used by interior mills for finish. You put up birch 4-in .and wider, shipping your better grades 6-in. and wider, with the understanding that the wide is all in, but in many cases it is taken out and sold at a better price to some other party, because he wanted something better, and then, the party getting the car of 6-in. and wider, does not get what he is paying for, especially if it is a mill that turns out interior finish, because 1 x 6 will not make an 8-in. base, and a 1 x 8 will not make a 10-in. base or panel, and so on.

In order that any mill may figure on birch for interior finish they must buy and carry in stock much more birch lumber than if they could buy the stock they wanted. If they could buy birch in dimension sizes, 6, 8, 10 and 12 in., or stock suitable for finish, they would not discourage a birch job as they have in the past, for the reason that they know they can get their requirments and they also know what the stock will cost them.

Birch, we all know, is the coming wood. It is a hard thing to beat for interior finish. It will finish to natural state, or any other way you want to put it, and it is hard to beat, even with oak, although we figure oak much more costly. Even though oak is much more costly than birch, we find that a job of interior finish can be made up much more easily, because in buying oak, 1st and 2nds, it averages wide, and we find a very small percentage under 7-in. in width. It is an easy matter to get your casing, and other wide stock out, without much extra cost and waste. On birch it is just the contrary, the wide stock, or stock you could use to any advantage is not there, and the larger percentage of shipments of 4/4 in. 1st and 2nds, is 6-in. and 7-in. stock, saying nothing of the lengths and with occasionally a few wide boards to make it look good.

We find these shipments largely when shipments are made through some wholesaler, and in many cases where the wholesale jobber does the shipping. They insist in shipping 1st and 2nds, 5-in. and wider, and in this reduce the percentage of 6-in. and wider stock. The mill, handling birch for interior finish, finds it almost impossible to get what it can use to an advantage and for this reason figures it is money out, and, therefore, prefers to handle yellow pine, oak or other woods because it knows it can get what it wants and also knows it will make a fair profit, and can satisfy its customer.

Now, I do not propose that you put up all your birch in dimension size or a grade suitable for interior finish, but would advise putting up some and advertising it. Mills that use it then know where they can get it, and without any doubt you will find birch used for interior finish and in place of other woods now used.

There are furniture factories and other factories who do not

* An address recently delivered before the Northern Hemlock and Hardwood Manufacturers' Association.

wish their birch lumber put up in this manner, as they can use common and better and can use a 4-in. strip as well as wider stock. They use short cuttings, and by glueing they make their wide stock. On the other hand, mills turning out interior finish can not do this with narrow stock and therefore require wider or stock put up such as they can use to advantage.

In order to get some idea how the interior finish mills find birch as an interior finish, I sent out a list of questions, asking them to answer them, either for or against, stating what experience they had with birch, comparing the same with yellow pine. Most of these lists were returned, and looking them over, I find all say that they could and would use more birch, provided they could buy it in dimension sizes, or stock put up for this class of work.

They claim that in buying birch, random widths, same as you manufacturers ship, and comparing it with yellow pine dimension, they find that on birch the percentage of waste is from 20 to 40 per cent. more. On the other hand, they state if they could buy birch in dimension sizes, or stock put up for this trade, they would find a smaller percentage of waste, and this would be due largely to the milling. Birch put through the planer oftentimes does not plane smooth. You will find it more or less curly or somewhat cross-grained. It is also found that birch put through the kiln depreciates in value.

My opinion is that if interior finish mills could buy birch in wider stock, the percentage of waste would be much smaller, even if they put it through the planer or kiln, because they would get a better class of lumber from the manufacturers, or lumber that would be especially suitable for the finish trade.

I think that if you manufacturers would decide to put up your birch in this way, it will help to find a larger market for your birch, and will put birch into the homes instead of other woods now used, and through your advertising department you will find results. I would recommend that your advertising department take this up with the architect, general contractor, the retail lumberman, and the mill that turns out interior finish, stating to its customers that birch can be bought to an advantage for interior work, and ask them to recommend it, more than they have in the past. You can get out some booklets same as the yellow pine mills, stating that birch is the wood to be used, and I assure you that you will get results. I would also recommend that you handle this class of lumber direct for this reason, that on a shipment made through a jobber, he may not ship just what the order calls for, and in order to blame some one puts it onto the mill, and the party getting the stock believes the jobber, who sold him the stock, and blames the mill for not filling his order as they should. By this, in many cases, you may lose a good customer.

And, in many cases, it is the mill who is trying to help you birch manufacturers gets this kind of shipment and in this way discourages this kind of finish all they can because they believe that it is impossible to get the proper kind of birch or grades required.

On the thicker thicknesses of the birch, we do not find this trouble. The very best part of the log you cut into thicker thickness, thus leaving the class of birch 4/4 in., required for interior finish, the poorer type, narrow and largely stock taken from the outer part of the log, as to where, if stock was selected for interior finish same as the thicker thickness, you would find a much better market and a larger amount of birch used for interior finish.

Therefore, it is my opinion that if you want mills of interior finish to use birch, you must put up a class of lumber that can be used, or otherwise it is of no use to try to recommend birch for finish.

---

The Dominion Board of Railway Commissioners have sent out to the Canadian Railway Companies notices drawing their attention to the requirement in connection with submitting reports on all fires originating within thirty feet of the track and burning over an area of 100 square feet or more outside the right-of-way, in forest sections. The notice instructs the railroad companies to submit these reports monthly from April 1st to November 30th inclusive.

---

The Temiskaming and Northern Ontario Railway Commission is suing the Abitibi Power and Paper Company, whose plant is located at Iroquois Falls, Ont., to recover $7,000 damages for alleged wrongful flooding of the plaintiff's lands. It is expected that the case will be heard in Toronto at an early date.

---

Timber inspector Geo. D. McKay, reports that the British Columbia lumber industry is reviving rapidly and that the shingle output today is larger than it was at any time during the past three years.

---

Recent reports from St. John, N.B., state that the latest charter of a sailing vessel on English account was at 116s. per standard.

P. J. Burns, Mayor of Bathurst, N.B., and prominent in the lumbering industry, died recently, aged 70.

# Over-feeding a Glutted Market

**Written specially for the Canada Lumberman**
**By Douglas Fir**

In reviewing the lumber business of the past few years, as one cannot help doing in these times which seem to be set apart for thought and reflection, we find many complications, upon which the average lumberman hesitates to comment. There is one thing though which will admit of discussion, and which I never could understand although I have spent my whole life in the lumber business; and that is our method of feeding and already over-fed, of glutted market. I have always been an ardent adherent to the theory that there is no part of the lumber business which requires more careful attention and good sound judgment in its management and handling than does the marketing of the manufactured product, and I think this theory is based upon a good logical foundation, for what would be the use of our watching every avenue in the manufacturing of stock to see that there are no leakages whereby profits may be leaking away if we do not keep up this same vigilance in the marketing? All the costs incident to the process of manufacturing and finishing the product together with those which may have started even before the trees were felled have now been added, and therefore it must be conceded that the product is of more value at this juncture than it has been in any other part of the process, and therefore should be subjected to correspondingly thoughtful and intelligent handling. But do we always find it so?

It is a pretty well established fact in manufacturing, that the minimum of cost is usually found in the maximum of output, all other things being consistent, and this is why a plant that is designed for, and capable of handling a certain output cannot be profitably operated at half that quantity. But even this theme of reducing manufacturing costs can be carried too far; even to the extent of reducing the cost at a loss. To the uninitiated this may seem queer, but it is a fact nevertheless, for just as soon as you concentrate all your thought and energy upon this one theme of reducing costs to the exclusion of all other consideration of detail, then look out for a slopping over, as it were, or a spilling of profits in different ways. This may occur on any of the machines or auxiliaries from the head saw to the trimmer, and may occur in various ways by lack of time to give proper attention to the work. In this way grades may be sacrificed, lumber may be slaughtered and wasted, stock may be sent to the refuse burner that, had it found its proper channel by way of more careful trimming would have gone with the finished product to the shed for high grades, and many pieces may be sent out during the day to swell the ever-increasing piles of dead stock in the yard that could just as well have been turned to good account in filling orders for immediate shipment; so that it is easy to see that even this laudable theme of trying to reduce costs to a minimum by the maximum of production method may, if carried too far reach the "Penny wise and pound foolish point." Like any other issue, it can be pressed to the limit of safety, but this limit should always be approached with discretion.

### Profits Not Always Dependent Upon Volume

This same reasoning, however, does not work out in the same way in the marketing of the lumber, and this seems to me to be where many good people err, for judging from observations in the past it would seem that in too many cases all hopes of profits in the marketing of our products have been hung upon the volume of business handled, and this has often been carried to the extent of going beyond the confines of our own mills in order to make delivery, when perhaps if we had used a little more discretion and shown a little less anxiety in taking this business we might have found that we could have realized more profit on half the order than we did on the whole of it, and then some one else would have had a chance to do likewise with the other half. It is a well-known fact with most of us, and should be known to any one who is entrusted with the important position of selling lumber that the more anxiety there is shown by the salesman, the less will be shown by the buyer, and this is what gives grounds for the theory which has been put forth recently that "The way to sell lumber is not to try to sell it." I cannot altogether subscribe to that theory myself, but I do say there is a limit beyond which we should not go in selling lumber, any more than we would in any other thing that had a point of danger, and the successful salesman will stop when he reaches that limit, while the unsuccessful, and unobserving one insofar as profits are concerned, will go right on and will gather in the volume, for it is volume only that he can see.

There is so much that could be said in this connection of volume versus profits that one hardly knows where to begin or where to stop. Let us imagine ourselves enjoying good times, and that trade is normal, and that we have enough of labor to operate comfortably, but none to spare, as we have all seen it in British Columbia, and suppose that from this period of prosperity our market is going into a decline,

and let us suppose for the purpose of this reasoning that I control one, two, or possibly three mills. I find that our sales are dropping off, and I decide to go and look over the situation leading up to or causing this condition. I arrive on the ground, and after looking about I conceive the idea that by taking some of my competitors' territory from them I can get almost any amount of business, but in order to do this I must offer some inducement, and we all know what that means. You may clothe it as you will, and paint it with the most artistic touches of the adept at such work, and yet when you have exhausted every effort to try to conceal its disagreeable features it stands out there in its true nature and in all its ugliness; it is price cutting! But it must be remembered that I am greedy, and to me it does not look so ugly as it does to those with less ambition, and then by a little mental calculation I figure out that I can make good any loss that I may sustain from reduced prices by running my mill, or mills double shift, and I will just go into this territory and will quote prices that will secure enough business to enable me to do this and I will make up the loss by the reduction of my fixed charges, consequent upon the results of this double operation and perhaps make a dollar or two per thousand feet to the good, for after all you know a dollar per thousand is not much to make, and can easily be gained in this way, and in the rapid turnover, and as to the other fellows whose territory I have invaded, well it does not matter much about them, they never were any good anyway, and so I take a night raid into their territory. If past history reveals anything, this is where the actual fighting begins, and pretty soon I find that these "no good" fellows can play at the game of cutting prices as well as I can, and as the slaughter goes on I begin to wonder if I am really going to get as much of that coveted trade as I had expected, for do I not find those same men whom I had expected to find busy making out orders for me now sitting back laughing and enjoying to the fullest the merry fight between myself and my competitors, their faces seeming to be all aglow with the knowledge that there are better things in store for them than what I had at first offered them, and now it dawns upon me that perhaps they encouraged me with this very object in view. Well this thing goes on until we have trimmed a couple of dollars or more from our profits, and still it is not settled, nor is there any more business than there was before.

### Persistency Wrongly Applied

I am going to start my mills night and day now, and I have wired instructions to that effect, because when I undertake to do a thing I am persistent, and I will just show those fellows that I will give them a good run for their money anyway, for what I lose in selling, I will make up by keeping my machinery in motion nights while their's is standing idle, and you'll see a bunch of fellows who will be sorry that they ever started in to run me. I now return home to see how they are progressing at the mills. "What! Cannot get men? Why how many do you lack? (It may be two hundred, and it may be five hundred, or even more). Well I had not thought of that difficulty, but as I said before, I am persistent. You just pass the news around and you'll get the men. Just let the men working for those fellows who are trying to run us out of the market know that we want men, and offer them some little inducement and you'll get them." Now this brings the battle right home, and in the face of such a conflict, if we cast aside during the struggle all rules of business propriety who can blame us? Pretty soon we find that we have forced our operating expenses for labor up far in excess of what we have forced our fixed charges down, and the only consolation we have is that we have forced our competitor's operating expenses up correspondingly, while his fixed charges have remained the same.

This kind of thing goes on until at last we find that if we are to continue to operate our mills we must look about for other markets, and it is then that we understand the full extent of our folly, for we now discover that we are operating under too great an expense to enable us to reach those other markets in competition with United States mills, and the increased cost of labor is considered by many as one of the greatest, if not the greatest of the composite parts in the formation of that alleged barrier. This obstruction however is being rapidly broken down, and in fact can already be said to be low enough to be surmountable, and now all eyes are turned in the direction of those markets from which we had almost wholly retired, owing perhaps, more to our unprecedented growth at home in the past few years, which has brought about the state of affairs herein described. Getting our feet upon solid ground once more however, and starting off from a new level, gives us renewed confidence, for it is confidently hoped that from this level we will be able to reach those markets to which we have heretofore seemed to have little or no access.

### Curtailment The Real Remedy

Now the proper thing to have done when we found the market weakening, and our costs of production so high that we could not reach those other markets would have been to curtail, and if necessary, take some concerted action for closing down for a period to let the market recover from its acute attack of sluggishness, caused from over-feeding, because we may make all the apologies we like, yet he would be a bold man who would came out and make the statement that we are not suffering more from an over-production in times gone by than from any other cause. I know that there are other causes which contribute to our present difficulty, but I am speaking of the chief cause, and one of the reasons why British Columbia is doomed to suffer from this malady is that God in His wisdom did not see fit to make it impossible for us to operate twelve months in the year as was done in the east. Perhaps the day will come when we will be able to get some kind of regulations here, in lieu of climatic conditions making it compulsory, whereby we can control the situation better, but at the present time it would appear that the seed has yet to be planted and the tree grown that will cast the shadow of that coming event.

## Practical Work for the Retailer

**By Julius Seidel**

My introduction to lumber was on February 1st, 1882, in the St. Louis yards of the Eau Claire Lumber Company, a Wisconsin corporation. The methods of that time, then considered practical in the successful conduct of a lumber yard, are in the main, obsolete in this day and time. In order to show the difference between business methods and business requirements of then and now, and, as a consequence, have the contrast appear strongest to you, I have drifted back to the eighties for comparison.

At that time the buyer went to the business house to trade, whereas now, thanks to our modern training, he has the business man come to him. Quite naturally the proprietor in those years came into personal contact with his customers. The customer to-day does not take his time, as a general proposition, to look up the yards when he needs supplies, but gets into touch with the several competing concerns of his city, and they are more than pleased to bring their store of samples and prices to him. Of course, as to overhead expense, business could then be done cheaper than now. There's quite a difference in your cost of operation if your customer calls with the real cash and is willing to be a beast of burden, as compared with having the cost of a solicitor, wagon delivery, collectors and incidentals added to your percentage of doing business. When your customer calls on you, your terms and conditions can be fixed and rigid, but if you solicit him they need to be flexible. There is a wide latitude between a man wanting your goods and your wanting his trade. Some sales managers will not agree with me—surely not the office trained manager who is in over his ears in system—but the manager who has been over the road and been brushing up against human nature, thus gaining practical experience, will agree with me in my conclusions.

This brings me up to one of the greatest practical issues: The motor truck delivery system in the country towns, the great thought of lumber merchants being leaders in serving their trade by a modern delivery system. Many of our lumbermen believe that the public wants cheap lumber—and the cheapest of service. This, too, when efficiency is the goal of every competing line. I contend that the larger percentage of buyers want good goods and good service, can afford to and wish to pay for both. The public in normal times does not talk of "high cost," because everybody is making money. It is only in the panicky days that it seeks bargains of us, the auctioneers of lumber. This because we have educated the public to the thought that lumber prices are unstable and fictitious in value. Thus do we proceed to pay back our hard earned profits on the installment plan when times are what is termed "hard." A great many dealers are foolish enough to think they encourage building when they cut the price, when the direct opposite is the result of our insane merchandising methods. The man who bought gets sore because he did not wait a "leetle" longer. You do not find labor cutting its price for you, do you?

### The Public's Idea of Service

In this evolution of service we cannot help but think of the delivery system as the issue that should have gotten, but did not get, the lumber yard's support at the time when the call was made for it. The old system of delivery had to be revolutionized. Why? Simply because there was absolutely no sense in any man owning a horse and wagon for which he had just one day's work per week. So business decided to deliver its goods, for even when the cost was added it spelled economy to the public. The inclination of the lumber yard has generally been to refuse to haul at all—or to do it under protest, like giving away a prize package. This idea prevailed to such an extent that the Parcels Post propaganda of the Government produced a nightmare. This, too when the clamor of the people for a Parcels Post became more and more aggressive and pronounced. We shivered to think of its coming—it would crush us as an avalanche covers the small village. We heeded not the public demand to deliver the goods to their doorsteps for a compensation. Now let me give you one practical thought on this subject.

Here were Government and state spending millions of dollars on "good roads," paving the way to get ready for Parcels Post delivery, and we asleep at the post. For whom are the good roads and what are they for? Why, for the benefit of all the people and the people

are the government. Parcels Post was for buyer and merchant—to bring them in closer contact. The lumber yard of the country believed, however, that our good Government was installing the Parcels Post for the purpose of downing the small merchant. No, the fact was, he was downing himself by being asleep or indifferent to the changing conditions of the times. The Government was simply going into the hauling business. Contrary to general competitive business principles, it threw its cards on the table and told you the scheme in advance.

Then it was that the country yard and all the merchants of the town should have incorporated a "Hauling or Service Company." It could have been started with little money by buying a motor truck of 1½ to 2½ tons. The farmer would have raved about it. Instead of talking about Parcels Post, they would have talked about you, and that, by the way, would have been great advertising. The lumber yards would have been leaders in the delivery service by uniting with other merchants to haul out lumber and supplies: Groceries, dry goods, hardware, implements, etc., and by bringing the farmers merchandise back.

This service company could haul by auto trucks cheaper than the farmer or the Government could do it, on account of the back tripping of farm products to your home town on the return and shipping them to the cities either in car loads or less, just as might be found practicable. Waiting, however, you let your competitor the Parcels Post get there first; yes, and you are letting the buyers scour your section of the country, your very own domain, as it were, for the farm products—be the latter butter and eggs, poultry, hay and grain, horses and mules—let them ship them past your door, instead of holding them for the old home town.

The Government is systematic and thorough, hence not cheap, and on this plan you could easily compete with its prices for service. The Government never did things by halves, and good service demands a good price. Inasmuch as the Government is being paid for its Parcels Post service, a drayage or service company as I have outlined, charging the Parcels Post rates for delivery, would prove a money maker from the outset.

If the Government, with its high-priced overhead, can make good money in the Parcels Post business, why can't you on short hauls? If you go in business you assume a responsibility not only to yourself, but to your community. You must rise to defend it and either be equal to emergencies or surrender to a better general.

### Brains to the Front

There are some who may think that this plan would encroach upon somebody's zone. I am for a live and let live policy, but nature does not limit the zone of a progressive mind. We cannot continue to be influenced by the "stand-patters," but must break away from traditional lines and push our business, even though some may step aside in the onward progress.

The "stand-patter" finds consolation in what is still left him, but "stand pat" means nothing less than retrogression in business. For some the lumber business may have no especial fascination and my remarks would touch them as does the rain drop that strikes the pane of glass and flows away, but leaves no impression. Those, however, who are in the lumber business and helping to perpetuate it, building for keeps; with a desire that their sons shall continue their work, must heed the failure attending their practical shortcoming.

### Moulding Public Opinion

We are using such slogans as. "Use lumber—more beautiful—costs less." "Use wood, where wood is best." But pray tell me, what are you collectively or individually doing to educate youth, or the public, in the use of wood? Have you ever conceived that the impressions made on the mind of the child from its eighth to its fourteenth year are very lasting, you might say indelible? What are you doing to impress youth with the beauty of woods and inspire a love of them, and what time have you devoted in teaching him the correct use of species?

At Christmas time last year, or any other year, did you buy your boy a wood block building set, or a steel "Mechano" or "American Model Builder" set, the one impressing him with the idea of construction with wood, the other one with steel? Did you buy him a set of wood working tools, or did you buy him sand forms and putty novelties? When you bought a checker board was it of wood, or was it of paper board?

Don't you know that the purchase of a good scroll saw is the best educator for a boy to use, plan and construct in wood? It teaches him the characteristics of the wood he cuts, whether it is long or short fibred, dense grain or spongy. He will learn the species, where the tree grows and the nature of it. He will acquire a little manual training and learn the art of sawing and gluing, nailing and varnishing. The inspiration he gets will lead him on to ask questions. Those questions will be of trees and woods. Why, you could afford to give away a few scroll saws yearly to the best boys at school. What training are you giving him in drawing, either freehand or architectural? Are you giving him the chance to learn building construction?

Did you ever conceive the idea of getting the boys of the graduating class to your yard, extending them the courtesy of showing them around and giving them a pleasant and instructive afternoon?

Now for the household. Do you buy wooden or galvanized buckets? Do you use a wooden coat hanger or one of wire? A wooden bench or one of wire, or cast iron? A wood body baby buggy with artillery wheels or one of steel frame and wire wheels? A wood match or one of wax or paraffine?

### Practicing What You Preach

And now for yourself: Do you use advertising signs of wood or of paper, tin or cloth? Is your office railing one of wire or of wood? Do you spend a little money for artistic office furniture, so as to inspire others to use it, or did you build it yourself with Bill, the teamster boss, using twenty penny spikes? Is your filing case of metal or of oak, the paper waste basket of wood or wire, the rulers of steel, or rubber, or wood? I very much fear that some of our good friends are like the minister who preaches the Ten Commandments and then does a little flirting with the wife when the husband is away on a trip. Then again, do you patronize the man who is for wood products? Gentlemen, we must be not only practical, but also consistent in our merchandising. The beauty of the situation is this: If we are really lumbermen, who are "for lumber," we can be enthusiastic as well as sincere in our promotion of wood.

When we consider the fact that the United States census of 1910 showed 784,989 persons engaged in lumber and lumber manufacturing industries, there ought to be little anxiety about the perpetuity of such industries, but, alas, we are reft apart in our departments, and the lumber industry as a whole lacks leadership in consequence thereof. You can be as ardent in defending your local, state, or manufacturing association as you wish, but the condition appertaining to promotion of the lumber industry in all its manifold ramifications is the real and paramount issue. You can be strong in defense of your town or your city, and equally loyal to your state, but you owe allegiance to your country above all. So, I say, set aside the material question and be self-sacrificing and lend your influence to accomplish the greater things that tend to help in perpetuating your industry.

The per capita consumption of lumber in the United States averages 260 feet. I have always considered it a God-send that the country has been endowed with this great asset. Foreign countries would use more lumber if they had it available at the low cost at which we sell it to the people in the states. Germany, France, Switzerland, England, Belgium, Holland and Italy use each year the total annual growth, not to speak of their imports. When countries import lumber it shows that they prize it far more highly at a greater value, than we do at a low value. Should our per capita use decrease? Certainly not, if we do the educational work that we should.

### Developing the Demand for New Woods

New species are coming into the market and why should the public not have the benefit of God's choicest wood products, no matter in which state they grow? Where California gives us her choicest fruits and grapes, other states reciprocate by exchanging with her, and us, those products of farm, forest, or mine with which they are blessed and of which they have an abundance. The same spirit exists when each state offers the public its choicest products of lumber. The education necessary to successfully conduct the lumber business in the future will have to be so broadened as to include a greater knowledge of species and their adaptability than is now current. Furthermore, a course in architecture and building construction will be a necessity in the large towns and cities.

It's up to the lumbermen to tell the trade what to use, where and how to use our material. Do not expect a builder to have a greater knowledge of your goods than you possess, and do not expect him to be a promoter of lumber or advocate its use to the owner.

We have entirely drifted away from the architect and engineer, owing to the sub-contracting system, and must now arrange a way to get our product before the owner, his architect or builder. For cities I suggest employing a building engineer by joint co-operation of yards. We must also get directly in touch with the public and present our goods in a manner that appeals to their understanding.

Thus we are brought right up to the latest issue in our business, the "ready made house." Oppose! Why? The writing has been on the wall for ten years and you could not see it. It took men outside of the lumber business to figure out its success. Year after year the price of carpenter labor has been advancing, thus making the cost of lumber higher when in position. Because of our shortcomings substitutes have had a chance to compete against what was and can yet be the cheapest of building material.

The cut stone business is an example of what hand labor, added to even a low-basis price, will do to put you out of business. Too late

it began the use of saws, planers and pneumatic tools, thus helping the terra cotta works to gain a foothold for keeps.

To say that a joist costs only $20 per thousand does not signify a low cost by any means—not any more than does the price of timber at the mill convey its ultimate cost in a yard taking a 24-cent rate. You can trim a 2x10—12 to exact length for 4 cents a piece and you can size it for 2 cents a piece. Instead of advertising this fact, you go the way of least resistance by selling the lumber in the crude. It is trimmed by high priced hand labor and the cost brought up to the danger line.

The objection of the builder to short lengths in lumber is not due to the fact that it cannot be used successfully, but mainly because of the high cost of trimming for position by high priced hand labor. It adds very materially to the cost, when you trim the ends of 1,000 feet of 10-foot flooring with three hundred cuts, or 1,000 feet of 16-foot with only one hundred and eighty-eight cuts.

The records show positively that 80 per cent. of yellow pine, 80 per cent. of fir and 90 per cent. of hemlock enters into building construction. The lumber yard and the manufacturers of these woods must consider this problem jointly.

The mills' attitude of forcing odd lengths on the yards, without consent, was an arbitrary act and not to their credit. The mills should work with their family and not disrupt it. Framing material will eventually have to come to the building trimmed to length and I fail to understand why this fact is not more generally realized. The piece stuff of the future will be furnished to the building ready for position. This thing of cutting and cutting with a hand saw at the building site until it fits is too costly. The dilatory lumberman, by not proposing this method long ago, created a new competitor and opened the way to the seller of "Ready Made Houses." Of course, you feel bady about it, but that fact does not change the matter at all. Again, I say to the progressive: Do not wait for the "stand patter," but blaze the path for the newer method of merchandising.

### Pushing the Sale of the Ready-Made House

Come out boldly and offer the home town the latest thing and last word in lumberdom: "The Ready-Made House"—on short notice. Handing him a plan book is only the introduction to the next move—the practical work. The cost of machinery, consisting of a universal machine, ripping table, small band saw and jointer, will be the biggest money maker you ever had in your business. The saw mill will find an outlet for its shorts. Low grades will have a value, because you do the trimming-out by machinery and furnish neat lengths. The demand for desirable lengths like all 16-foot will cease.

Lumber trimmed to the next odd length will stop the complaints on "waste in cutting." Dead stocks will be a past issue with the retail dealer, as he will cut up and trim out such stock and turn it into money. I am sure you can see the wisdom of being progressive. The saw mills may not be able to handle this proposition. It is the retailers' problem and it is my opinion that a retail yard can, by "going to it" in this matter, make a substantial profit and justify the investment. Let me expand upon the thought that any retailer has a duty to perform in the promotion of that business, and that it is your duty to learn the practical needs of the lumber business. I am free to say that if the manufacturer of lumber should shoulder all the cares of the business from stump to finish, namely develop, promote and defend it in order to sell his output, he would need no retailer, but would do that work of retailing himself. We, as retailers, are the ones to encourage that belief.

Our industry as a whole lacks leadership and its about time that petty jealousies between individuals and associations are relegated to the rear chairs. It is lack of leadership that has given the substitutes the start. While we scramble amongst ourselves to make sales, they are busy moulding public opinion to believe their product is it.

I am certain that associations in the future will have to do more constructive work than they have in the past, and the incentive to help must come from the persons so associated. The annual meetings of many of the bodies are arranged for pastimes and pleasure and are made a Chamber of Commerce for buying. While this is praiseworthy and may be pleasing to some, it should have its limitations. These annuals should be more matters of an executive character, namely, a caucus of practical men of the line to decide upon practical things to do. While we may not number oratory amongst our accomplishments, we do know how to talk business in plain old democratic fashion.

Gentlemen, I have prefaced my remarks with the title "Practical Work—The Lost Chord in the Lumber Business." Genius is inspired, invention is the gift of the dreamer, but its the practical men who run the current of affairs through the transformer and bring them to the people. Too many confuse the idea of movement with that of advancement. A hobby-horse has movement, but never progresses from the spot. In conclusion, I would say that we can solve our problems. We do not lack in ability. Religions have their brotherhood. Why not the woodmen of the world? May the day be not far distant when the practical men who do things receive the recognition due them for trying to solve the daily problems of our life's work.

# Combating the Dry Rot in Timbers

## Branding and Better Grading Proposed as Only Practical Method of Protecting Consumer Against Loss

Although it is probable that, on account of the duty recently placed upon lumber entering Canada, the volume of imports of yellow pine will be considerably lessened, Canadians are, and will continue to be, interested in everything regarding the important problem of preventing dry rot in this species of timber. Recently several exceptionally interesting articles have appeared in the Canada Lumberman upon this subject, written by Mr. Fred J. Hoxie, Insurance Engineer who has made investigations for the inspection department of The Associated Factory Mutual Fire Insurance Companies. We are indebted to the American Lumberman for a more recent discussion of the subject by Mr. Hoxie who is about to issue a report upon yellow pine grading and dry rot in structural timber, for the Associated Factory Mutual Companies.

Mr. Hoxie's study has covered thoroughly all phases of the subject, from the standing timber in the pine forests of the South to the occupied buildings insured and inspected by the companies he represents. He has travelled thousands of miles in the course of his investigations, visiting logging camps, sawmills, lumber yards and factory plants of all types of construction, both in the United States and in Canada, including a number where conditions favoring the growth of dry rot fungi have caused great damage. He has conferred with scores of prominent architects, construction engineers and scientists. His data have been verified in many instances by experts at the Forest Products Laboratory and in the Forest Service, with whom he has consulted.

### Purpose of the Investigation

First of all, he wanted it distinctly understood that no sentimental or other interest in the lumber business had had any part in his work or his report. The sole concern, he explained, that the Factory Mutual Insurance Companies have with yellow pine grading and the problem of combating dry rot is to make certain that their insured risks secure the very best possible construction in their plants, thus reducing the fire liability to the lowest possible minimum. Said he:

The mutual companies have for many years favored the slow-burning type of mill construction, and we still heartily believe in it if the lumbermen will give us the right sort of lumber. When the lumber that is put into the factory is right the economy and efficiency of this type of construction are not to be excelled for many purposes. But within the last few years we have not been getting the right sort of lumber. There has been a remarkable increase in the prevalence of dry rot. That it is the quality of the lumber which is at fault can not be doubted. Serious loss has resulted from dry rot in buildings put up within three or four years, while in the same vicinity there are other factories used for similar purposes and constructed of the prime grades of long-leaf pine such as were sold a dozen or more years ago which are still in perfectly sound condition.

This is a grave problem for us and for our factory owners. And I assure you that it is going to be a graver problem for the lumber trade of this country. When a man buys and pays for what is sold him by a lumber merchant as the best grade of long-leaf southern pine, and puts it into his factory only to have it to go to pieces on his hands in two or three years you can be pretty sure he won't take any chances of getting stung again. He will insist on concrete construction the next time no matter what the architects tell him.

It is a well-known fact that wood infected with dry rot ignites more easily than sound wood. It has been proved by experience that mill timbers with rotten ends fall quickly under fire, while when the timbers are all sound a building of the slow-burning type of construction will stand up better under fire than a steel frame building and give the fire extinguishing apparatus a chance to get into action and prevent any serious damage. That is one important reason why the mutual insurance companies are deeply interested in this serious problem of the proper grading of lumber and of getting rid of dry rot.

### What the Lumbermen Should Do

The officers and engineers of our companies believe it is quite practical and possible largely to eliminate the threatening danger of dry rot in mill timbers and in this way save many thousands of dollars for our members. It can easily be done with the co-operation of the lumbermen themselves. First of all they should completely revolutionize their unscientific method of grading yellow pine. The real long-leaf heartwood, whose resistance to decay naturally is great, should be sold at a premium and the factory owners would gladly pay the bonus if they knew they would get what they were paying for. All the rest of the lower grades should receive some preservative treatment right at the mill where the lumber is manufacturd before it has had a chance to become infected.

My investigations and experience have thoroughly convinced me that the first lumber manufacturer who will thus revolutionize his methods will make a fortune. There would be big money in it even

right here in the North for a lumber merchant. Let him adopt a trade mark and grade his lumber right in the yard, selling only the very finest heartwood long-leaf untreated, treat all the rest, putting his trade mark on everything that leaves his yard and guaranteeing each stick of wood to give satisfaction. Even with the limited knowledge we now have of the causes and best methods of preventing dry rot, such a merchant would be safe in guaranteeing his lumber for ten years. And a lumberman who will guarantee his lumber for ten years can make a fortune selling only a small fraction of the factory owners insured with the mutual companies.

The ideal practice would be for the manufacturer and the lumber yard to work together. As quickly as the log is sawn the lumber should be dipped in a 1 per cent solution of corrosive sublimate. During my investigations in the South I found that some logs at the mill had become infected with dry rot fungi even before they had been manufactured. It commonly happened that manufactured lumber awaiting shipment showed the characteristic lace-like growths of fungi. The infected lumber infects more timbers and so the infection spreads until the lumber arrives at the wharf in the North, where it is piled and usually exposed to the dampness in which the fungi thrive. Then when the wholesaler sells the lumber he runs it through a planing mill, which is provided for that very purpose at the wharf, takes off the weather-stained exterior surface and sells it in a freshened condition that would deceive anyone but an expert. It is possible, however, to detect this infected lumber. When it dries out you will find little brown spots that betray the presence of dry rot fungi. This is not infallible, though, for the fungus sometimes has penetrated to the inside of the timber where it may lie dormant for long periods until conditions are again favorable for its growth.

The best practice then is for the manufacturer and the lumber yard to work together, the manufacturer sterilizing the lumber at the mill before shipment and a more thorough treatment being given in the yard before the lumber is sold. When the timber is cut to fit its position in the factory the cut surface should receive a preservative treatment. This can be done with a brush dipped in the corrosive sublimate solution if it be not practical to dip the timber itself in a tank at the scene of construction. Recently, at some of our factories, the corrosive sublimate method of preservation has been used at the job. The expense is only about $3 a thousand board feet and sometimes it is less. This includes the cost of the tank on a fairly large sized construction job. The tank may be either of concrete or of wood. A metal such as iron should not be used, because it is affected by the solution. Where the tank is for permanent use, such as in a lumber yard which intends to adopt the method I have suggested, I should recommend concrete, but for a single job on the scene of construction a wooden tank is quite satisfactory and inexpensive.

Of course, if your lumber is deeply infected with living rot fungus when you decide to treat it there may be difficulty in thoroughly protecting it from decay, because the solution may not penetrate to all the spots inside the wood where infection exists. But with proper grading and handling at the mill there won't be even that danger. One fertile source of infection even of fairly good grade lumber I found in the retailers' and wholesalers' yards where it is piled on wooden sticks laid directly on the ground, or where infected pieces are used over and over again in building up the piles. I believe that the best method woud be to provide concrete or masonry supports upon which to pile the lumber awaiting sale or delivery. Lumbermen should overcome their prejudice against concrete for the purposes for which it it best suited. I found a few yards which have now adopted this method of piling lumber on concrete supports. Lumber, even small pieces, which shows any signs of infection with dry rot should not be allowed to come in contact with sound lumber under any consideration. That is as dangerous for the sound lumber as it would b for your children to allow them to play in a contagious hospital.

If the cement people had $100,000 they wanted to spend for advertising they couldn't spend it to better purpose or more profitably than by paying it to the lumbermen of this country to go ahead conducting the lumber business just as they are now.

### Reason for Investigation at This Time

This last striking statement Mr. Hoxie reiterated as an absolutely practical business proposition. He said that unless the methods of handling and selling lumber are completely revolutionized he believes that before long there will be no market for it whatever in factory construction.

Mr. Hoxie was asked why, with such a pessimistic outlook for the lumber business, the factory mutual companies should go to such great trouble and expense in the present investigation. He answered.

Because we heartily believe in lumber and that the intelligence and business sagacity of the lumbermen will convince them that their methods now in use are wrong, I am confident that the lumbermen will eventually see that they are hurting their own business by using grading rules which permit short-leaf and loblolly pine to be sold as "commercial long-leaf." As things are to-day they are getting for their best lumber the price for the poorest. It has been the custom to pick out the best stuff for export to other countries, in some instances, especially to Germany, as the German buyers at the mills won't have anything but the best and they are willing to pay for it. But even here the lumbermen are hurting themselves by ringing in poor stuff, as I am informed that American lumber which has gone to some foreign countries in late years has been the subject of complaint. When a domestic buyer orders long-leaf the mill ships him everything from loblolly and North Carolina pine and short-leaf to real long-leaf, all that will get by the obsolete grading rules. Now if they picked out the real prime long-leaf they could get just as much for the rest as they do to-day. And there are a lot of users of lumber who would be glad to pay a premium for the best of the long-leaf.

I am satisfied after my investigations in the South and visits to the mills and the timberlands where they are cutting that there is plenty of good long-leaf left. The trouble is that we can not get it unless we will take a lot of comparatively worthless stuff with it. The right place to grade the lumber is where it is cut, not where it is frequently necessary to employ cumbersome tests to be positive what you are getting. It is easy to tell long-leaf when it is growing, from loblolly or short-leaf, but the manufactured lumber often looks very much alike. You can be sure enough, though, of the difference after you have put the stuff in your factory and the short-leaf and the loblolly have begun to go to pieces. Why not brand the true long-leaf as soon as it is cut? There will be no trouble then. And it will be money in the lumberman's pocket in the end.

There was a recent instance where a paper manufacturing plant required new room planks. We advised the paper manufacturer to write a yellow pine manufacturer who was cutting in a district where there was plenty of good long-leaf. He did. He distinctly explained he wanted good long-leaf with plenty of rosin in it, because anything else will go to pieces quickly from dry rot in the excessive humidity of a paper mill. He paid the price he was quoted without question. And he got lumber whose density varied from 47 pounds per cubic foot to 26 pounds per cubic foot, and with resinous content varying from 1.2 per cent. to 7.9 per cent! And yet that is about the average, I understand, of the all-heart grade of "long-leaf" that will get by under your present grading rules. Even lumbermen themselves will admit, I am sure, there are not many purposes for which lumber of such a wide range of density is equally well suited. If this lot had been sorted out properly all of it would have been worth more.

### A Better Grading System Required

What is required is a system of grading which is based on the actual physical and resistent qualities of the wood and not on the number of rings per inch or similar distinction. We don't know as yet all the reasons why some woods will resist dry rot better than others; we do know that resinous woods are more resistent than woods that are less resinous.

There are different species of dry rot fungus and all of them require moisture in some degree to develop. The rosin in the wood waterproofs it to some extent, thus keeping out the fungus, and it is very possible that there are other elements that exist in highly resinous woods which increase its resistent power. Experiment has shown that at least 3 per cent of rosin in the wood is necessary to prevent fungus from growing, but probably 4 per cent. would be the safer margin to insure the wood's resistent quality. That is why heartwood is to be preferred to sapwood. Long-leaf pine shows a wide variation in the resinous content, from the bark to the heart of the tree. This fact is recognized in the present system of grading which makes the proportion of heartwood the guarantee of durability. But there may be heartwood from some trees with less resinous content than lumber from another tree that would be excluded by the present grading rules as having too little heartwood. What we want is a system of grading rules based on the proportion of rosin in the wood to fix its durability, and on the density of the wood to fix its strength. All wood would weigh about the same and be equally strong if it were equally done If the lumber were "all wood"—that is, if there were no air cells—it would weigh about 100 pounds per cubic foot. The best long-leaf pine weighs around 40 pounds, and so it is stronger than short-leaf, which weighs around 30 pounds to the cubic foot.

### A Suggetsed Grading System

An excellent system of grading would be something like this:

Density.—No part of the material shall have a density of less than 30 pounds per cubic foot when tested by boring 1-inch holes in the ends of the stick, drying and weighing the borings and computing the density from the volume of the hole.

Durability.—Heartwood shall show in all four faces of every stick and sapwood shall not extend more than 2 inches from the corner at any place measured perpendicularly to the corner along the face.

None of the heartwood shall show less than 4 per cent. of rosin when borings are taken with a 1-inch bit, dried and extracted with benzole, the extracted rosin evaporated until it is not soft or sticky when touched with the finger at 70 degrees Fahrenheit.

Specifications such as these would require selected long-leaf pine

from the butts of trees, and the lumber passed would command a much higher price and it would be well worth a higher price than the "commercial long-leaf" sold to-day.

Testing for resinous content is quite a simple process. Any lumberman could do it. You merely require a little benzole, a wide-necked bottle to contain it and a bit to bore the lumber, and finally scales for weighing. After testing a few of the different appearing kinds of yellow pine a man accustomed to handling lumber ought to be able to judge very closely by the apearance the percentage of resinous content of any given specimen. The greasy appearance of the end of the grain of lumber containing a large percentage of rosin is characteristic.

I recently tried an experiment which demonstrated quite convincingly that resinous wood is more resistant to fungus than non-resinous wood. I dissolved the rosin out of a piece of long-leaf pine heartwood and then infected the specimen with merulius eachrymans, the more common form of dry rot fungus. A piece of the same stick of long-leaf from which the rosin had not been extracted was also infected and both specimens were allowed to remain together for a year. At the end of that period I found that the weight of the specimen from which the rosin had been extracted had been reduced four times as much as the original wood, thus clearly proving that the rosin had a very powerful preservative action.

I found another instance proving the resistent quality of resinous wood in the case of a factory from which a number of rotted timbers had been removed. Actual tests showed that the parts of the beams which had resisted the fungus contained much more rosin than those parts which had been invaded by dry rot.

The lumbermen talk of a more efficient utilization of our forests. They have just held a great conference at Chicago to form a federation to promote the larger use of forest products. All this is very commendable, but the utilization of the forests should be permanent if it is to be of real value economically. Utilization should not consist of passing the loss on from the manufacturer of lumber to the man who puts it in a building.

**Founding of Laboratory by Forest Products Federation Suggested**

The idea was suggested of the new Forest Products Federation founding a laboratory to fix standard methods of handling lumber and to find the purposes for which the various woods are best suited. Replied Mr. Hoxie:

A most excellent idea! It is quite probable that the lumbermen would be more disposed to support and listen to such an institution founded by themselves. Of course, the very best experts in the various lines such a laboratory would follow in its investigations should be secured to make their findings authoritative. Another interesting and important feature of such an institution would be that, alhough they would be working from a different viewpoint, the lumbermen's scientists would check up their investigations with the experts working in the Government's Forest Products Laboratory at Madison, and this friendly rivalry would undoubtedly stimulate the knowledge of lumber, its preservation and its most efficient utilization.

But we already have the Federal laboratory at Madison and the lumbermen should support more heartily the important work being done there. With their limited equipment the Government experts have already added considerable to our general knowledge of dry rot and of wood preservation. For the coming year they have outlined some very important lines of investigation which, if carried through successfully, would be of great benefit to the lumber trade.

**Where Wood Could Hold Its Own**

It had been so pleasant to hear an insurance man speak favorably of wooden construction that the interviewer took a chance and asked this question:

If you could get the so-called fireproof construction of steel, concrete, brick, etc, at the same cost, or even less, than you can get wood to-day, would you not drop wood at once and recommend the concrete, etc?

Mr. Hoxie's answer was prompt and emphatic. He said:

No, I should not use concrete entirely, even at a less price than wood. There are some purposes for which wood is more suitable than anything else we have available to-day. Take the roof of a paper or cotton mill, for example. Where the necessarily high humidity of the atmosphere in the mill promotes quick destruction from dry rot of the sort of lumber we are getting to-day, it might be best, if the question of cost be eliminated, to build the mill of concrete, but even then, to get the best sort of building, you should have a wooden roof. Moisture will collect on any other kind of roof in cold weather and drip on the product being manufactured beneath, causing serious injury. Wood is a poor conductor of heat and hence makes the best kind of roof for such a plant. It is not even necessary to buy high grade lumber for the roof if you use a suitable preservative treatment. The cheapest stuff, with knots, shakes, etc., is quite satisfactory if you sterilize it. A good thick roof of 4 inches or so of plank is just about the best mill roof there is. Of course, the exterior should be properly waterproofed.

Care should be exercised in choosing a proper preservative method. The use of some of the oily substances employed in preserving wood might seriously increase the fire hazard. The fire might spread across the roofs faster than the sprinkler heads could open and cause considerable damage, even though the oil had a high flash point, because a thin film on wood, which is such a poor conductor of heat, would heat quickly. A corrosive sublimate solution would be the best preservative. True, the corrosive sublimate is poisonous, but there could be no objection to a weak solution of 1 per cent. in which the roof planks should be soaked before they are laid. In several instances good results have been obtained by using this preservative on an old roof which has already become infected with dry rot fungus. For this purpose about one pound of corrosive sublimate should be dissolved in 12 gallons of wood alcohol. It can be applied to the surface with whitewash brushes and injected into holes bored in the larger beams.

Mr. Hoxie gave some very interesting information about the curious living organisms which cause dry rot in wood. Originally, it was supposed that wood rotted just as iron rusts, and that the strange lace-like plants growing on rotted parts of a wooden beam were attracted by the decayed wood. Now scientists have positively established that it is these delicate appearing plants or fungi which cause the rotting process. Mr. Hoxie believes there is also some strange chemical action caused in the wood besides the life progress of the fungus through the cells of the wood. If fungus is cultivated on a block of sound wood and then removed, for a time the piece of sound wood appears as bright and sound as ever, but after being exposed for a time to a dry atmosphere the wood begins to shrink and the characteristic brown, cracked, powdery appearance known as rotted wood develops. According to Mr. Hoxie's theory, the fungus ceases to make any vital progress as soon as the drying begins, but certain organic enzymes are now present in the wood cells and oxidation in the air is rapid.

**Cause of Destruction of Mill Timbers**

Destruction of mill timbers is caused by two different kinds of fungus. One thrives in moist air and the other prefers a climatic relatively dryer. Two of the most frequent species of the so-called dry rot group are Merulius lachrymans and the coniophoria. Mr. Hoxie has found specimens so widely distributed it would appear that there is no climate which is immune. The other, or damp rot, group is the Polypidous family, including the Trametes serialis and the Fomes roseus. Damp rot requires plenty of moisture and thrives best in a place such as an unventilated basement. Mr. Hoxie has found that heating a mill to about 115 degrees for a length of time occasionally, such as over Sunday, will often arrest the growth of fungus through the drying out of the moisture from the timbers on and in which the plants live. But this will not affect some kinds of fungus, such as those which thrive on the inside of roofs in mills where the temperature is normally high. Nothing will discourage these latter organisms from existing but complete dryness, which is not possible in some mill plants, or sterilizing the wood where they are growing with some chemical preservative, such as corrosive sublimate, sodium fluoride, etc.

In the course of his experiments Mr Hoxie demonstrated that wood has a certain photographic activity which varies with different woods. He was unsuccessful in proving that this strange property has anything to do with the susceptibility of the different woods to decay, but he believes the phenomena have some significance in that connection. He found that oak and Scotch fir were very active in their effect on a sensitive photographic plate, cedar, cherry, maple, birch, spruce and locust were moderately active, and ash, elm and horse cehstnut only slightly active. This activity is increased if the wood be exposed to sunlight before it is brought in contact with the photographic plate. Mr. Hoxie found that in the case of southern pine the activity of the heartwood is much more increased by exposure to light than is the sapwood. He exposed a specimen to the sunlight for two hours, then placed it in contact with a sensitive photographic plate for a week in total darkness.. At the end of that time the image of the heartwood grain bands had made a strong impression on the plate, while the sapwood was not nearly so clear. He found that exposure of the wood before photographing to a moderately increased temperature had the same effect as the sunlight, which would suggest it is the heat which effects the photographic property rather than the light. To a certain extent the woods which are photographically active in the highest degree are also proportionately resistent to fungus, thus suggesting there is some fungicidal power in the elements that cause the activity.

While in the South Mr. Hoxie prepared a list of mills operating in districts where there is plenty of real long-leaf pine, and some of the manufacturers agreed to brand the lumber if the purchasers desired it. A list of these progressive manufacturers is to be supplied to the members of the factory mutual companies, and they will be encouraged to buy their future supplies of structural lumber thus branded.

# WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## Wanted–Lumber

### Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

### Wanted to Buy

Birch, Oak, Maple, Ash and Elm. Apply by letter, stating prices, thicknesses, lengths, average widths, quality, also name point of shipment, to Robert Cox & Company, Hope Building, Ottawa, Ont. 7-10

### Wanted

Cedar Posts, straight, sound, 16 ft. long by 5 in. at small end, and, 25 ft. to 30 ft. long by 5 in. at the small end. In Car Lots, F. O. B. Montreal. Need not be peeled. Address The Meyer-Thomas Co., Limited, 230 Coristine Building, Montreal. 7

### WANTED

For early spring shipment
10 cars 4 ft. white pine lath No. 3.
10 cars 4 ft. white pine lath No. 2.
2 cars 4 ft. white pine lath No. 1.
10 cars 4 ft. hemlock lath No. 2.
5 cars 4 ft. hemlock lath No. 1
AMERICAN LUMBER & MFG. CO.,
5-8 Pittsburg, Pa.

### Wanted To Buy

50,000 ft. 1-in. Cull Pine.
50,000 ft. 1-in. Cull Basswood
50,000 ft. 1-in. Cull Hardwood.
1,000,000 ft. 1-in. and 2-in. Hemlock.
200,000 pieces 1½-in. lath.

Apply Box 139, Canada Lumberman, Toronto. 4-7

## For Sale–Lumber

### For Sale

For shipment May 1st car lots Cheese box, Veneer. G. R. Jones, Eldorado, Ont. 6-9

### We Have a Full Stock

of Hardwood, Hemlock and White and Norway Pine Lumber, Norway and White Pine Piling, up to 60 ft. Keenan Bros., Limited, Owen Sound, Ont. 3t.f.

### For Sale—Timber

30,000 feet first grade maple squares for axles and bolsters; 12 ft. long, 4 in. x 5 in., 4½ in. x 5½ in., 5 in. x 6 in.; price $35.00 per M., f.o.b. Alvinston, M. C. R. R. Apply The R. Stirrett Co., Petrolea. 7

### FOR SALE
### Norway Pine—Mill Run

| | |
|---|---|
| 1 x 4/5 x 10/16 ft. | 1,000,000 ft. |
| 1 x 6 | 500,000 ft. |
| 1 x 8 | 85,000 ft. |
| 1 x 10 | 14,000 ft. |
| 2 x 4 | 165,000 ft. |
| 2 x 6 | 220,000 ft. |
| 2 x 8 | 320,000 ft. |
| 2 x 10 | 218,000 ft. |
| 2 x 12 | 65,000 ft. |
| Norway Pine Culls | |
| 1 x 4 and up x 10/16 ft. | 1,500,000 ft. |

DEVON LUMBER CO.,
5t.f. Ottawa, Ont.

### Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.
GEO. C. GOODFELLOW,
c Montreal, Que.

## For Sale–Machinery

### Wanted

Second-hand Band Re-Saw. Send full particulars and quote best cash price to Savoie & Company, Manseau, Que. 7-8

### For Sale

One Whitney 50-in. scraping machine, complete with knife grinder. It has been in use about one year. Will sell on easy terms. Address

AMERICAN COMPOUND DOOR CO.,
4-7 21st and Morgan Streets, Chicago, Ill.

### Woodworking Machinery For Sale

1 No. 51 Crescent universal woodworker; 2 24-in. planers and matchers; 3 12-in. buzz planers; 1 12-in. four-side moulder; 1 No. 802 Canada Machinery Corporation shaper; 5 30-in. Ideal pedestal bandsaws; 2 No. 619 Canada Machinery Corporation saw tables; 1 36-in. double drum sander; 1 20-in. American wood scraper.

H. W. PETRIE, LTD., Toronto.

### Rebuilt Veneer Machines

We have the following rebuilt Coe veneer lathes and clippers ready for immediate shipment:

Lathe, 50-in. swing, 88-in. knife, 6-in. spindles.
Lathe, 50-in. swing, 64-in. knife, 5-in. spindles.
Lathe, 50-in. swing, 76-in. knife, 6-in. spindles.
100-in. power clipper.
64-in. foot power clipper.

These machines are decided bargains and carry the same guarantee as we give our new ones. Prices on application.

THE COE MANUFACTURING COMPANY,
23t.f. Painesville, Ohio.

## Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Position wanted as band saw filer, double or single cut. A1 references. Address Box 140, Canada Lumberman, Toronto. 4-7

Experienced Hardwood Lumber Inspector open for engagement. Best of references. Road or yard work. Box 175 Canada Lumberman, Toronto. 7

Lath Mill Man wants position to run a lath mill by the day or per thousand. Will go anywhere. Ten years' experience. References. Box 151, Canada Lumberman, Toronto. 5-7

WANTED situation as sawmill Foreman. 29 years' experience in high capacity Mills. Expert Mechanic, Band Mills a speciality. Thos. Sissons, 234 Liverpool Street, Montreal, P.Q. 5-7

Position wanted as saw mill foreman or millwright. Can give best of references. Age 44. Address Box 141, Canada Lumberman, Toronto. 4-7

Mill or General Superintendent wants position. Eastern and western experience. Splendid record. References. Box 131, Canada Lumberman, Toronto. 3-7

A1 Band Saw Filer wants position. Double or single cut. Will go anywhere with good season's cut. Best references. Box 138, Canada Lumberman, Toronto. 4-7

WANTED to get into communication with lumber firm who can offer position of responsibility. Good general knowledge, having filled positions from mill hand to paymaster. Preference for work at mill, hard worker, good references, age 31 years, married, sober. Box 168, Canada Lumberman, Toronto. F

Expert Band Saw Filer wants position. Fourteen years' experience on single and double cut saws. No proposition too large. Guarantee satisfaction in hard or soft woods. Strictly sober. A No. 1 reference. Address Saw Filer, P. O. Box 592, Memphis, Tenn., U.S.A. 6-10

Practical lumberman and mill constructing engineer, thoroughly experienced in the designing and constructing of mills and wharves for deep water transportation vessels with several years experience as manager of large lumbering operation from stump to market, now open for a position. Pulp wood operation a specialty. Best of references. Apply Box 176, Canada Lumberman, Toronto. 7

Position wanted by manager. Have learned the business by practical experience, east and Pacific Coast. Managed all branches: expert on manufacturing, also mill designing and building. Good organizer and cost reducer. References guaranteeing efficiency and character. Box 130, Canada Lumberman, Toronto. 3-7

Position wanted by factory superintendent. Have learned the business by practical experience in large factories. Managed all branches. Expert in the manufacture of veneer and veneered cabinet work. Special knowledge of planing factory construction and equipment. Good organizer and cost reducer. Best credentials. Box 397, St. Jean, Que. 6-8

A Forest Engineer who studied at the best American Universities—actually in Government employ—with many years of practical experience in all branches of lumbering in East and West previous to receiving technical training, and possessing equally well both languages, is desirous to enter employ of some large firms or lumber association. Best references from past and present employers. Box 173, Canada Lumberman, Toronto, Ont. 7-9

### MILL HELP WANTED

We want some good mill men—an edger man, a saw marker, a resaw man, a double-cut band sawyer, and a double-cut filer—Quebec province. Reply immediately, full particulars. Box 174, Canada Lumberman, Toronto. 7

## Wanted–Employees

**Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents**

WANTED—An experienced shipper to ship and inspect lumber in Ontario. Apply Box 135, Canada Lumberman, Toronto. 4-7

WANTED—First-class man for travelling and selling lumber in Ontario. State age, experience and salary expected. Apply Box 136, Canada Lumberman, Toronto. 4-7

Experienced man wanted to take charge of planing mill. Must be capable of taking full charge of machine, grinding knives, etc. State references and experience. Box 153, Canada Lumberman, Toronto. F

### Wanted at Once

Master Mechanic for Logging Railroad and Saw Mill. Must have A1 References, Ability and Character. Good position for right man. Davison Lumber Company, Limited, Bridgewater, N.S. 7

## Business Chances

WANTED practical man to take third or half interest in Lumber, Stave and Heading Mill, well equipped, well situated, and making good money. Box 169, Canada Lumberman, Toronto. 6

### Wanted

Log contract by reliable party with good outfit of horses and shanty plant. From four to eight million yearly. Apply Box 161, Canada Lumberman, Toronto, Ont. 6-7

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

### Wanted

Salesmen selling supplies to Lumbermen and Contractors to handle as a side line Dr. J. M. Stewart's Veterinary Remedies, now being used by the greater number of Lumber Companies in Canada. Liberal commission.

PALMER MEDICAL CO., LTD.,
7-t.f. Windsor, Ont.

## Good Location Wanted

**for Well Equipped**

**Sash, Door and Planing Mill**

Would like to operate small sawmill in connection. Give full particulars in first letter. Box 170 Canada Lumberman, Toronto. 7

### FOR SALE

The Lumber Yard of the Estate of D. Dupuis, situated on St. James Street, Hull.

The property comprises a valuable block of land, having frontages of 254 feet on St. James Street, 221 feet on Leduc Street, 142 feet on Wellington Street, and 210 feet deep between St. James and Leduc Streets.

The yards are stocked with a large quantity of valuable lumber of all kinds.

The business is a good going concern, having a large trade, and was established in 1890. It can be purchased en bloc, or the lumber and rolling stock can be bought separately and the land rented.

The property is a valuable building site, suitable for subdivision into city lots, and is situated right in the heart of the business section of the city.

For particulars apply to P. H. Charron, 142 Champlain Ave., Hull. 7-10

## Timber Limit

**Berth No. 6 (Sale of 1885) lying between the Township of Mowat and the Georgian Bay and East Channel of French River, exclusive of Indian Reserve.**

The undersigned invites offers for the Timber on Berth 6 as covered by Government License.

Quantity about 7,000,000 feet, mostly White and Red Pine. These estimates are not guaranteed in any way.

Government License can be inspected at my office.

BRYAN PONTIFEX, Liquidator,
Ontario Lumber Company, Ltd.,
6-7 2 Leader Lane, Toronto.

## Miscellaneous

**For Sale**

Copies of "The Preservation of Structural Timber," by Howard F. Weiss. Published in 1915 by McGraw-Hill Book Company. 312 pages, illustrated. Price $3.00. Canada Lumberman, 347 Adelaide Street West, Toronto.

**Tug Boat For Sale**

Wooden hull, strongly built. Length 54½ ft., beam 15 ft., depth 5 ft. 9 in. Compound engines 8 in. x 16 in. x 12 in., condenser, steam winch, Jenckes Marine boiler 7 x 7 ft., two corrugated furnaces. All in good condition. Apply to

J. RICHARDSON CO., LTD.,
5-8 Matane, P.Q.

**Do You Want to Buy or Sell?**

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department"

**Saw Mill Machinery For Sale**

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

### The Bathurst Lumber Company's New Pulp Mill

The annual report of the Crown Land Department of the Province of New Brunswick which has just been issued contains an interesting reference to the Bathurst Lumber Company's operations in connection with the erection of its new pulp mill at Bathurst. This report was written on December 2nd, 1914, by the manager of the Bathurst Lumber Company, and is as follows:—

During the year, The Bathurst Lumber Company, Limited, owning limits tributary to Bathurst, in both New Brunswick and Quebec, has started construction of a modern pulp and paper plant, within the limits of the town of Bathurst, in Gloucester County. This plant will constitute the highest development of this industry within the province, and will greatly augment its industrial activities and prominence, particularly in the lines of forest products.

The buildings will be completely closed in before the end of the year. They are a fine type of factory construction, built in a substantial manner and according to the modern engineering practice. Fireproof construction of steel and concrete is employed throughout. All buildings are daylight construction; the whole sides of most buildings being glass in steel sash. The building progress holds the record for paper mill construction in Canada. The first sod was turned June 27, and buildings all closed in by December 31.

The plant is advantageously located on Bathurst harbor, with both rail and deep sea shipping facilities, and enjoys many exceptional economic advantages.

A number of unique features are embodied in this new mill. The supply of raw material will not, as is usual with pulp mills, be a menace to the future lumber supply, by denuding timber lands. The entire supply will be obtained from what is now wasted in the company's lumbering operations. The waste to be employed will be both the logging and manufacturing waste. The first class of waste will comprise tops of the trees cut for saw logs, small trees cut in clearing roads, skids and camp logs. The objection many pulp mills have to using knotty tree tops is overcome at Bathurst, where their new methods use knotty wood as well.

The second class, that is, mill waste, will be obtained from the company's sawmills on the harbor, and from outside mills as well. This is the first mill in America to use mill waste for making high class pulp, or anything but sulphite pulp. This is possible by employing entirely new methods of barking, such as have been introduced about a year ago in Sweden. They have been perfected and adapted by the company's own engineers, and constitute a decided advance in the manufacture of wood products.

The additional waste of sawdust and bark will temporarily be employed to produce power, but eventually it is proposed to destructively distill this waste, giving wood alcohol, acetone, acetate of lime and charcoal.

The company have designed a new dutch oven for burning this wet waste, which will have very high efficiency with water soaked bark and sawdust, thus giving the maximum amount of power therefrom. Then instead of this mill refuse being an expense to eliminate, it will be an asset to conserve.

The products, too of this plant are unique in Canada. The mills at present under construction provide for an output of twenty-five tons of bleached mitscherlich sulphite pulp, and sixty tons per day of extra strong container board.

The sulphite pulp to be manufactured here will displace a German product in Canada. The manufacturers of high grade papers have brought all this pulp from German mills, since it is not made in England, where they have no wood supply, and are buyers instead of manufacturers of pulp. The two plants in the United States, making a similar product are confined to the west, and do not sell in the Eastern States or Canadian market. New Brunswick will have the honor of supplying a pulp, which is sorely needed at the present time by the Canadian paper trade, since the German supplies are cut off.

The container board will be used in making paper boxes, cases, pails, and for heavy containers of all kinds. It will be extra strong and waterproof.

### The First-Class Filer

I often wonder what constitutes a filer of the first class. Take bench work, for instance, says J. W. M., in the Woodworker. I have always found that to regulate the back is the one part of the job that savors of magnitude. Once one has the back, the rest follows in quick time. Often I have seen articles about rolling, and they generally say that to roll nearer than 1-in. from the edge will change the back. This is true, but I wish to tell the novice that in 75 per cent. of cases, anywhere on the back half of the plate the roll will lengthen the back some if the saw is appreciably fast; and the front half is susceptible in a like manner. This, I wish to make clear to the beginner, would not apply when there is a pretty good tension.

Suppose, for instance, a section of the plate fitted the tension gage so nicely that no light came through. Then one could roll all but an inch strip on each edge and not change the back. Sometimes the back is snaky. By the time the back is true, parts or sections are open enough or too much, while other sections have become fast, either a little in front or behind the centre. Then is when one must needs go carefully, or get a lot of extra work on his hands.

Another thing: Often, in stretching a short place on the back, say 7 or 8 ins. long, there will be a place on each side of this place where the back will be too long. So it is usually safe, first, to roll the short place out to the gage, then mark off a like distance each side of it in front, and roll that lightly in front.

I have had this brought home to me very forcibly at times, especially in the case of a very thin saw, say 22-gage. And that reminds me that I asked The Wood-Worker's readers to enlighten me on very thin saws. I saw but one answer, and that contained but little satisfaction, the writer saying that the 22-gage tried to go out of the mill.

I have done very well with a 22-gage, and think others might with perseverance. It took me some time to get the saw into good condition. Finally I succeeded in getting the saw to make good lines in soft, air-dried stock of not too fibrous a nature; then, with a little more fussing, it would cut almost anything. The best I have been able to do with a 22-gage was the resawing of ¼-in. teak wood veneers, 12 ins. wide. I obtained two veneers 3/32-in. in thickness, but had to sharpen the saw after every cut. The saw would go through but one veneer, and stay in the line. I have resawn mahogany up to 28-in. width, and sawn it well, and I must say that while a 22-gage is a ticklish proposition, it will saw very well indeed, but requires a lot more care than a 19-gage saw.

### Lower Freight Rates Needed For Eastern Export Trade

In connection with the application of the railroad companies for permission to increase their freight rates between points east of Port Arthur, the following quotations from a letter which we have received from E. B. Foss & Company, Bay City, Mich., who operate the Hope Lumber mill at Thessalon, Ont., is interesting and important:—"We think that the export trade of Canada could be increased to a large extent," they say, "by lowering all freight rates into eastern and central traffic association territory in the United States, which would allow mills, especially in the Georgian Bay district, to compete with wholesale yards in the Tonawanda district. The bulk of the lumber from the Georgian Bay district is going into the United States anyway, by water, but with lower freight rates, this lumber could be shipped direct from the mills in car shipments."

**WASTE ELIMINATION**
IN LOGGING OPERATIONS
My reports show where the waste is, and how it may be eliminated.

Railroad location and construction. Roads and Rivers improvements. Good information concerning Quebec Timber and Mining lands, cheerfully given.

# Review of Current Trade Conditions

### Ontario

Although there is really nothing definitely new to report in connection with the lumber trade in Ontario, the feeling of confidence in the outlook for gradual improvement continues. The actual volume of trade shows no increase of importance, but enquiries indicate a widening of the demand in the course of the next month. The money market, which has so much to do with activity in lumber, is somewhat easier. People desiring to build are finding it a little easier to obtain loans, not so much from loan companies, as from private parties. Those who can secure money for building purposes are wisely deciding to go ahead, as lumber and many other materials are at their low point in price. The speculative builder is still out of the market and probably for all concerned it is best that he should remain so for some time.

Reports from the country yards are fairly encouraging, more so than those from the cities. Retailers in country districts are expecting a much larger spring business than they had last year. Farmers have plenty of money now, and as they can secure both labor and materials at low prices they are commencing to plan new building operations more extensively than usual. Hardwoods continue active in the cheaper lines and there is a fair movement also in the upper grades for sorting up stocks. The factory demand is still quiet. Ottawa dealers report an improved enquiry and a more encouraging outlook.

### Eastern Canada

As in most parts of Ontario and Quebec, the lumber trade of Montreal is feeling encouraged over a slight but quite definite improvement in the volume of business. Conditions are reported to be favorable for increased activity as the season advances. No one is looking for extensive building operations, but the country districts will undoubtedly show a fair amount of construction work. It is expected that the export trade to Great Britain will be extensive, providing, of course, that vessels can be obtained. Spruce prices continue to rule high. The Montreal trade is finding the new tariff on lumber entering Canada a favorable factor, as it is increasing the consumption of domestic lumber. At present there is no change to report in the freight situation. It is expected that the rates when navigation opens will be around 125s for deals and 150s for timber.

The demand for eastern spruce at Boston continues to show improvement and prices are firm. Quotations have been marked up on frames from 50c. to $1. The lowest quotation today for frames 8-in. and under, Boston rate, railroad shipments, is $23.50. Some firms are expecting a further advance before long. Eastern spruce dimension stock is quoted as follows:—8-in. and under, $23.50 to $24; 9-in., $24.50 to $25; 10-in., $25.50 to $26; 11-in. and 12-in., $26.50 to $27. Prices asked for random also show a better tone. The current range is, 2 x 3, $21; 2 x 4, $22; 2 x 5, 2 x 6 and 2 x 7, $20.50 to $21; 2 x 8, $22 to $22.50; 2 x 10, $23 to $24; 2 x 12, $24 to $24.50. There is a little more business in shingles at Boston, building operations having shown an increase. Prices, however, are still weak, on account of the persistent attacks of "the fire prevention" campaign. Some of the best white cedar extras are offered at $3.40. Very good extras can be had at $3.30. White cedar clears are offering at $2.80 to $2.90 and second clears at $2.50 to $2.60. Red cedar quotations show a wide range varying from $3.65 down to $3.30 for extras. Arrivals of lath are plentiful and prices are still low, although the trade is increasing. For 1⅝-in. $4.10 to $4.15 is being quoted. Prices of 1½-in. are a little firmer, ranging from $3.75 to $3.90.

### Great Britain

The financial market in Great Britain continues unchanged. Money is very cheap and discount rates are low. Lumber buyers are taking advantage of this and paying cash for their purchases as much as possible, thus securing the contract discount rate which is never less than 5 per cent. per annum and in some cases touches a much higher figure. Latest reports indicate that there is still no immediate prospect of white sea stocks being available, and also state that Canadian spruce deals and battens, apart from the limited output from the Lower ports, can scarcely be looked for until the end of May. Consumers of white wood therefore are largely thrown back on Norwegian and Swedish shippers for their next three months' requirements. The result of this situation is that prices of white wood continue to advance and the packing case trade in particular is feeling the shortage greatly. Messrs. Churchill & Sim in their latest reports state that New Brunswick spruce deals continue to be imported at the prevalent high figure, the rates of freight being partly responsible for the increase. London prices stiffened a little during the month, but did not result in importers agreeing very readily to the present c. i. f. quotations. Extensive quantities of pine deals which have been held in London for some time awaiting the naturally slow demand, have been sold at prices satisfactory to sellers. A freight fixture was recently arranged at 120s from Miramichi to United Kingdom—Ireland, for 160 standards of deals f.o.w. The same rate was fixed from St. John or Halifax to the West Coast of Great Britain or the East Coast of Ireland for a cargo of deals. Arrivals of sawn and planed wood for February were, in spite of the war, higher than during February, 1914. The arrivals of pitwood were about the same as a year ago. Arrivals of hewn timber show a decline. In general, the figures show that although less wood is being imported from Russia a much increased quantity is coming from Sweden and Norway and also from Canada.

At London, the demand for white wood for the packing case trade continues very strong. Most of the mills and works have only orders in hand to last them for several months, but the supplies of suitable wood are very limited. There are scarcely any fair quality deals and battens in spruce or white wood which can be purchased at less than £15 per standard in docks. Such goods as city cut St. John spruce battens are usually sold at £15 to £15 10s c. i. f. according to specification.

No noticeable change is reported in market conditions for soft woods at Liverpool. Enquiries are plentiful, but importers are unwilling to take the risk of fluctuations in the freight rates. The spot situation also continues unchanged, prices in every direction being fully maintained. Practically the whole of the limited import is going direct into consumption and stocks are all depleted. The spruce market shows no change. Transport difficulties have resulted in confining the trade to small consignment lots, for which agents have found a ready market at strong figures. Manchester importers are commencing to look to the north of Europe again for arrivals. Freights are showing no signs of easing off. Spruce has been sold to Liverpool and below on the Manchester Ship Canal at £15 10s c. i. f. with a fair percentage of 7 in. and 8 in.

### United States

The lumber trade in the United States is coming definitely to a belief that during the present year it is reasonable to look forward with confidence to a steady buying movement from dealers and consumers. There is an equally unanimous belief that 1915 will not see anything in the nature of a business boom. Taking everything into consideration a steady movement would be the most satisfactory for everyone concerned. Reports which have been received from eastern points are more favorable than they have been for some time past. New England building operations during the last six weeks show an increase of 20 per cent. in volume over those of January. Builders report that they are not meeting with any trouble in persuading the banks to assist them financially in connection with legitimate propositions. Many lines of industries are running steadily. Among the railroad companies it is noticeable that there is a much more general tendency to restore conditions where economies had resulted in impairment. The general situation in connection with the retail yards is that a fair amount of business, even though not up to normal, will result in heavy deliveries from manufacturers' stocks, which in its turn should bring about stronger prices. Weather conditions in general have been favorable for spring crops.

Manufacturers on the Pacific Coast are a little more cheerful than they were a month ago. Slight improvement is shown in the demand from the Middle West. There is a heavier movement of yard stock and the outlook is brighter. Curtailment also is commencing to have a strengthening effect upon the situation. Prices are steadier and firmer. Enquiries which have been received indicate that the railroad companies can be counted upon to take a large amount of the coast products in the future. California trade is expected to consume a large amount of stock this year. There is a fair foreign demand, which would be much more extensive if sufficient tonnage could be secured at more reasonable rates.

The hardwood business is reported to be improving slowly and steadily, the demand from consuming factories having picked up materially. An indication of this is afforded by a report from the Illinois Central Railroad to the effect that there is a heavy increase in the movement of lumber, especially northbound. Northern pine and hemlock continue to make only a fair showing. Hemlock dimension and boards are slow, but improvement is looked for when the build-

View of Mills in Sarnia.

# BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

***"Rush Orders Rushed"***

## Cleveland-Sarnia Sawmills Co., Limited

**SARNIA, ONTARIO**

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

ing situation becomes more active. A few fair-sized orders for northern pine have been reported lately. Prices of both northern pine and hemlock are soft, largely on account of competition from other woods, but both lines are expected to improve with the broadening of the spring demand. The greater part of the buying of northern pine at North Tonawanda is limited to immediate requirements. Prices are irregular, especially on some lines that are more plentiful than others. Six inch box is weaker than it has been for two years past, selling for from $21 to $22. Eight, 10 and 12-in. box are in good demand and stocks are decreasing, so that prices are firm. A little improvement in hemlock is reported from North Tonawanda on account of mild weather and the placing of contracts by prospective builders.

# Market Correspondence

**SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD**

## Montreal Trade More Promising

Montreal, March 25th (Special to the Canada Lumberman):—Although nothing to boast about, there is a little revival in the lumber trade. The turnover is still far from satisfactory, but as the season advances the chances are favorable to more pronounced activity. No large amount of building may be expected in the city, for the accommodation in offices and houses is ample, but there is hope of a fair amount of construction work in the country districts, which have not been affected to any extent by the commercial set-back. Reports to hand indicate that many mills in the province have been manufacturing for the British market, and, providing that vessels can be obtained, there should be a very substantial amount of lumber sent to that quarter. The great demand is for spruce, with prices ruling high. The new tariff is a favorable factor in the general position, as it is certain to make for the increased consumption of domestic lumber, replacing to a certain extent wood which has been dumped on this market at a very low rate.

Very little change is to be reported in the freight situation in connection with shipments to Great Britain when navigation opens. There are reports that space for 5,000 standards has been booked on account of one firm. The probabilities are that rates will be about 125s. for deals and 150s. for timber, although the steamship companies state that much will depend upon the ships available and the cargo offering. Sir George Foster is hopeful of securing additional boats, and he announced that negotiations are in progress with the British Admiralty by which it is expected that by May 1st the old fleet will be back in the subsidized postal service. This is good news for lumbermen, as it will give partial relief to the freight service.

An Ottawa River mill, manufacturing about fifteen million feet of spruce per annum, has sold its entire cut for 1915 at very much higher prices than last year. Part of the cut is for the British market.

The Railway Commissioners on the 18th inst. held a very long sitting in this city, and did not finish until 6.30 in the evening, when the entire schedule of commodities objected to was cleared up. The arguments over lumber occupied more time than any other commodity; the case for the trade was very strongly and ably put by Mr. F. Hawkins, Mr. S. W. Tilston, Mr. A. H. Campbell, and Mr. W. A. Filion. The reply of the railway companies was, briefly, that they needed more money; that the rates to Montreal were comparatively low, and that the proposed increases were reasonable. A vigorous protest was made against the proposal of the companies to increase the export rates pending a decision on the general case, it being urged that this was unfair in view of the contracts that have been made ahead, and the Chairman intimated that, having regard to the conditions, it was only natural that the exporters should have made contracts on the old rate basis. The chairman put some very pertinent questions to those arguing for and against the rates, and once or twice his questions proved rather embarrassing to the speakers.

## Ottawa Trade Prospects Improving

Ottawa, March 22nd (Special to the Canada Lumberman): Prospects are improving as spring draws nearer for considerable activity in the lumber trade in Ottawa and district. Inquiries for low and medium grades are increasing from buyers in the United States and there is a fair movement from here to that country, where business generally seems to be good. Work in the woods is practically over and log-driving will commence as soon as the lakes and rivers are clear of ice. Conditions were never better in the bush for getting out logs, than they were last winter. The lumbermen along the Ottawa and its tributaries plan to open their saw mills as early as possible this year so that if trade does not improve as the summer advances, they can shut down early in the fall. Prices remain the same and are not likely to alter for some time to come.

Local lumbermen are watching with interest the progress of the inquiry which is being conducted by the Railway Commission into the application of the Canadian railways for a general increase in their freight rates on all lines east of Port Arthur. Another protest was lodged against the application at the resumed hearing in Montreal by Mr. Frank Hawkins, Secretary of the Canadian Lumbermen's Association.

Senator Lougheed announced in the Senate recently that since the Grand Trunk Pacific have refused to take over that part of the line from Winnipeg to Moncton, N.B., the line will be operated by the Government. The district through which the line runs includes many well-timbered areas and one of the best pulpwood districts in Canada. Senator Lougheed said that the Government would operate the road in a limited way before spring came.

## Liverpool and Manchester Stocks

The following report upon Liverpool and Manchester stocks for the month ending March 1st, 1915, is furnished by H. W. Lightburne & Company, Liverpool, and their St. John, N.B., representatives John E. Moore & Company, Limited.

## Barbados Market Report

S. P. Musson, Son & Company, Barbados, report under date of March 5th, as follows:—Lumberstuffs.—White pine—The Schr. "Mary Hendry" from Liverpool, has arrived during the fortnight with 267 m. ft., which had been previously sold to arrive at $34 and $26 for merchantable and second quality respectively. The market is lightly supplied and we value further receipts at around $33 and $34 duty paid for merchantable. Spruce—The market is heavily stocked and values are declining, a cargo having been offered at $26 duty paid, and refused, while further receipts are known to be on the way. Shingles—The position is the same as last advised. Stocks are heavy with no demand. Shooks and wood hoops—No receipts.

## The John D. Mershon Company's Change

In the March 15th issue of the Canada Lumberman an item was published in regard to the John D. Mershon Lumber Company, Saginaw, Mich., in which we regret to state that an error appeared. Instead of stating that Mr. John D. Mershon's interest in the business had been bought out, we should have stated that Mr. W. D. Mershon's interest had been bought out. The John D. Mershon Lumber Company are the exclusive eastern representatives of the Pacific Lumber Company, whose mills are located at Scotia, Cal., and who claim to be the largest manufacturers of redwood in the world. The company report an increased interest in redwood in Canada during the last few weeks.

# Lumber and Pulp Men

You will save money in placing your orders now for your requirements for 1915 and 1916 operations. As you are aware there has been an advance in all Raw Materials equal to about 7½ % to cover War Tax. We are still in position to give you the same prices offered on January 1st.

## Prescriptions for Present-day Lumber Trade Troubles

"Some Troubles of the Lumber Industry," was the title of an important address delivered recently by Mr. R. S. Kellogg before the Northern Hemlock and Hardwood Manufacturers' Association. After outlining and discussing the chief troubles from which the industry is suffering today, Mr. Kellogg drew the following conclusions:—

First—The lumberman should work in the dark no longer. He should establish clearly and scientifically exactly what it costs to manufacture and sell lumber. Until he does so, he will never have the courage to ask what his product is worth. This is by no means a simple problem. It means better accounting methods, and more appreciation of neglected factors than has heretofore been given in any but a few of the best managed operations. To begin with, there is stumpage. How many lumbermen know what the stumpage costs that goes through their mills in any one month or any one year? Suppose we bought stumpage averaging 7,500 feet per acre for $2 a thousand, or $15 an acre, ten years ago. Suppose, further, that the taxes on it have been only one per cent. of the cost price, or 15 cents per acre annually. What is that stumpage worth today? We are not justified in assuming a lower interest rate than 6 per cent., and foresters tell us that in long-deferred operations like forestry, we must figure compound interest. A well-known mathematical formula shows us that this acre today stands us in $28.74, or $3.83 per M., with no cost of fire protection or other carrying charge than taxes and interest. If, therefore, we have been lucky enough to escape fire and other damage, we are making no profit when we get $4 a thousand for this stumpage. We are simply getting 6 per cent. interest on our money, which we might have done with much less risk through other investments. There are not a few lumbering operations in this country which are backed by a 30-year timber supply. I wonder how many of their owners know the stumpage value of the last log that will be cut? The same mathematical formula as used before shows that this final value will be nearly seven times the purchase price. How many cost of production statements carry this yearly allowance for increment in stumpage costs?

In its long-time timber contracts, the United States Forest Service recognizes the propriety of allowing lumbermen a profit of 12 per cent. above all expenses of operation and interest on the investment in the manufacture of Government timber. Few lumbering operations in privately-owned timber can show as good a return as this.

SECOND—The utilization of timber tracts must become much more efficient and complete before the lumber industry can be put upon a stable basis. We mustn't have so many eggs in one basket. Ways must be found to market more than one-third of the volume of wood per acre. Much of this must be accomplished by scientific research—the rest by working up a market for diversified products.

The varied characteristics of species of timber and classes of logs will never permit the attainment of the human and mechanical perfection in manufacturing processes that one sees when he visits that acme of efficiency—The Ford factory. Yet I dare suggest that a proper classification of logs before they are sent to the mill would materially increase the efficiency of the operation. Moreover, there is opportunity for a further development of conveyor systems and coordination of processes than obtains in many mills. The possibilities of reducing logging costs are by no means exhausted and other savings can be made by the proper application of engineering and manufacturing principles.

THIRD—There should be a greater insistence upon honest grades of lumber. Too many times the lumber business has been discredited by juggling with grades and by the substitution of grades because the consumer was ignorant of the rules. The public today calls for honest goods, and more is to be made in the long run by selling a product strictly according to grade than by any temporary advantage secured through the substitution of poorer material, which can be made to pass through the ignorance of the buyer. Permanent success must be founded upon the bedrock of full measure and good quality. The mail order houses advertise "your money back if not satisfied" and this is a tremendous selling force. It has been well said that "you must make your business better if you want business to be better."

FOURTH—In many kinds of timber there should be a greater diversity of grades carefully framed to meet the needs of various classes of customers. The buyer does not generally object to being forced to take material which only partially meets his needs because its specifications are framed by someone who does not know his wants.

FIFTH—Forest products should be sold more intelligently. That is, upon much wider and more complete information concerning the requirements of all classes of consumers throughout the territory of profitable distribution. This sounds like an unnecessary statement, but the working of it out is no easy task. Since the foregoing was dictated, I have received a letter from a lumberman of widely recognized selling ability who writes:

"We have no system whatever for marketing our product. We, as manufacturers, know less about how to sell our lumber, whom to sell it to, how much is going to be needed and when, than manufacturers in any other industry. This is largely because the units of manufacture and control in the lumber industry are too small. We are thousands of local manufacturers with local points of view and local information trying to sell our product on a wide general market in competition with ourselves and everyone else.

"It is reasonable to suppose that this condition could be greately helped if the manufacturers of each separate kind of wood were more exactly informed as to the general market for their own product and the substitutes in competition therewith and would legitimately co-operate with each other in maintaining production at a point justified by the demand."

SIXTH—The lumber manufacturer should tell the consumer how his product can be used. In the words of a prominent sales manager—"Lumber used to be bought, now it must be sold"—and it must be sold in the face of strong competition. This phase of the business has been so well put from the standpoint of the man who specifies building materials that I quote as follows from a recent statement by a prominent architect in one of our largest cities:

"The substitutes for lumber which are becoming so popular, owe their success to the national advertising campaigns which have been conducted by the cement, brick and other fire-proofing material interests. If the lumbermen of this country would conduct a similar educational advertising campaign, which would show the legitimate uses of wood, there is no question in my mind but that lumber would hold its own as a building material. I can think of a great many ways in which the legitimate uses of lumber might be strongly emphasized.

"On the other hand, the lumber manufacturers, instead of improving their product as years have passed, permitted its quality to deteriorate. In contrast to this, the cement manufacturers have developed a uniform standard product, which can to-day be purchased in the open market without tests or inspection, and used with the certainty of regular and satisfactory results.

"The structural steel companies have issued hand books which instruct and facilitate the use of steel for every purpose. This applies to steel for every purpose in building construction. Hollow tile and brick manufacturers have developed systems of fire-proofing, of economical floor construction and other construction features, which enable the architect or the owner to figure accurately on uniform costs and results. This condition applies to all of the materials which you label 'substitutes for wood.'

"Looking at the reverse of this proposition, we find that the lumber interests have not done any special work toward the enlightenment of the public, beyond the issuance of a few pamphlets, which are sent to architects. The owner does not know the merits of the various kinds of flooring, for instance; and as an architect, I find a total ignorance on the part of the average man who builds, as to the uses to which different woods should be put.

"Take flooring for instance. Oak, maple and yellow pine are commonly used and it is difficult to get accurate information on the grading of these different woods as used for flooring, and the average owner knows little or nothing as to the relative merits. The same applies to lumber for finishing purposes, for interior purposes in general and for purely structural purposes.

* * *

"These are facts, as I know from personal experience, and if the contention of the lumbermen is true, that wood is still plentiful and low in price, there is no justification for this deterioration in quality. At least, if we have the poorer grades, we still should be able to get perfect quality, if we wish to pay for it. This is frequently impossible."

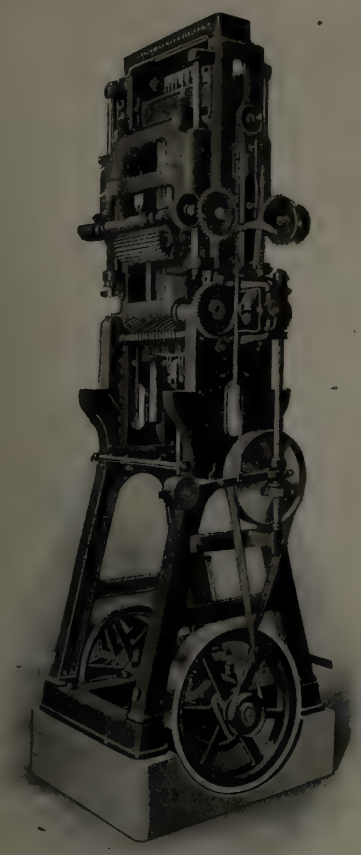
SEVENTH—Directly in line with the foregoing suggestions, the public must be educated to the real merits and uses of wood, and this education must be a continuous process—not spasmodic. This means intelligently planned, skilfully prepared and carefully placed advertising and other forms of publicity. It must be on a scale commensurate with the magnitude of the industry and it must be continuous because the public forgets quickly. The successful advertiser keeps everlastingly at it. When advertising stops, sales stop.

There is an organization called the American Society of Agricultural Engineers. It is composed chiefly of the men who teach farm engineering in the Agricultural Colleges and who are looked up to as authorities by farmers everywhere. The Society has a number of permanent committees. One of them is a Committee on Farm Structures, and another, a Committee on Farm Building Equipment. The Chairmen of both these committees are representatives of a large cement company. This same company also gives a free correspondence course in concrete construction to any one who asks for it. Comment is unnecessary.

EIGHTH—The lumberman must have more faith in his own product. No man ever sold goods long and successfully who didn't believe in them heart and soul. The lumberman who hasn't the courage of his convictions when he undertakes to sell lumber, better be selling something else. If he thinks that fir is better than pine, he shouldn't be a pine manufacturer. If he thinks that gum is better than birch, he should be selling gum. If he likes redwood better than the "Wood Eternal" he shouldn't be handling cypress. If he thinks that tile, cement and concrete are the only desirable building materials, he shouldn't be a lumberman at all.

NINTH—The only way to reduce the waste of forest resources equally deplored by lumbermen and conservationists, is to restrict the production of lumber to market demands. Unrestrained competition has never produced anything but wholesale waste of natural resources, nor will it do else in the future. Lumbermen and conservationists alike should work for the accomplishment of legislation and —still more important—the education of public opinion to see that it is much more desirable to have a regulated output of forest products

(Concluded on page 52)



# BOLINDERS'

## Saw Mill and Woodworking Machinery

meets the most exacting requirements of the up-to-date Saw Mill man.

Designed to meet the present day demand for machines capable of rapid and economical production with a minimum amount of labor.

The Bolinder line includes **High Speed Log Sawing Machines, Double Edgers, Cross Cut Saws, High Speed Flooring and Matchboarding Machines, Planing Machines, Automatic Boxboard Machines, Circular and Band Resaws, Special Patented Tonguing and Grooving Cutters, Etc.**

Ball Bearings used throughout.

# A New Bulletin on Power Apparatus

YEARS ago we developed an engine in order to supply suitable prime movers for our fans. This was perfected and improved. Then a complete line was designed which proved so successful that Sturtevant engines are to-day used universally wherever high grade machines are required.

Since the original development more than 40 years ago we have broadened our field of manufacture. Other lines have been added one by one until the complete list of Sturtevant Power Apparatus now includes:

**Engines**
**Turbines**
**Motors**
**Generating Sets**
**Turbo-Pumps**
**Fuel Economizers**
**Mechanical Draft Apparatus**
**Turbo-Undergrate Blowers**
**Mechanical Stokers**

Our new publication illustrates all of these lines and we have a copy for you.

## "Hipcoscope" Lumberman's Electric Lantern

**Always Ready. Can't Start a Fire. Cheaper to Use than Oil.**

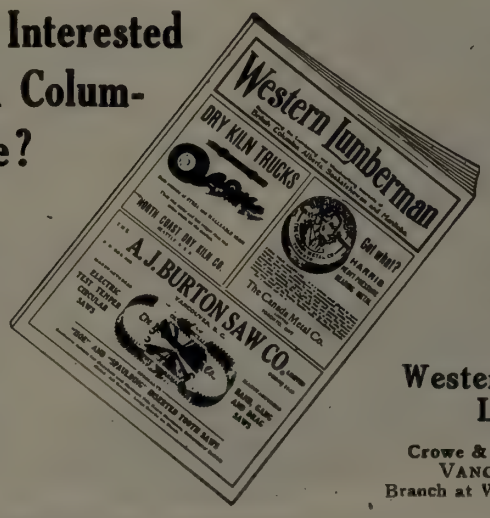
This new searchlight (see illustration) will throw a strong light 300 feet. Operated on two No. 6 dry cells which may be secured anywhere in Canada for twenty-five cents each.

The "Hipcoscope" is the ideal light for your night watchman—he can search every alley. The "Hipcoscope" gives 200 hours light for fifty cents.

It is impossible for the "Hipcoscope" to start a fire no matter what you do to it. Used with the "Hardinge" Portable Watchman's Clock your plant and yard are practically safe from fire or theft. Owing to weight it does not pay to ship batteries. Delivered free without batteries, for $4.50 anywhere in Canada.

**Lintz-Porter Co., 27 Yonge St. Arcade, Toronto**

## Are You Interested in British Columbia Trade?



The immensity of the Lumber Industry will within a few years make this Province the most important in the whole Dominion.

There is undoubtedly a big market for Mill Equipment of all kinds. Let us Demonstrate our Advertising service. We please others, we can please you.

# EDGINGS

### Ontario

Craik Bros., Crampton, Ont., sawmill operators, have dissolved partnership.

The sawmill belonging to Noel Page at Monetville, Ont., was recently destroyed by fire.

Work has been commenced upon the erection of a planing mill at Thorold, Ont., by Herbert Moisley.

The Port Dover Planing Mills Company, Port Dover, Ont., will install equipment for the manufacture of chairs, furniture frames, etc.

Geo. Freeman, Fergus Street, Mount Forest, Ont., has commenced work on alterations to his woodworking factory. The estimated cost is $2,500.

The Beach Cheese Box Company, Limited, Morrisburg, Ont., which was recently incorporated with capital stock of $40,000, is considering plans for the erection of a cheese box factory at Morrisburg. Mr. F. W. Beach, Morrisburg, is one of the incorporators.

J. E. Baechler, Goderich, Ont., reports that he intends to re-commence building operatins upon his sawmill on April 1st. This work was commenced last year and was not continued during the severe winter weather. Mr. Baechler expects that the plant will be complete about the middle of May.

Knechtel Bros., Limited, have been incorporated with head offices at Southampton, Ont., to take over and carry on the manufacturing businesses heretofore carried on by Solomon Knechtel at Southampton under the registered names of "The Knechtel Wood Turning Company" and "The Southampton Iron Works." The capital stock of the company is $50,000.

The Spanish River Lumber Company, Sudbury, Ont., recently purchased the sawmill at Cutler, Ont., formerly operated by Stone and Grant. They commenced repairing and remodelling the mill and had spent from $6,000 to $8,000 upon it when it was completely destroyed by fire on the night of March 11th. The cause of the fire is unknown, but it is supposed to have resulted from defective electric wiring. The mill and boiler house were a complete loss, and one or two boilers were slightly damaged. The loss amounted to $100,000 and the insurance was $30,000. The company intend to erect an up-to-date two-band mill with horizontal resaw, and are hard at work in connection with the reconstruction already. They hope to have the mill completed by July 1st.

### Eastern Canada

The saw mill at O'Leary, P. E. I., owned by Ira Clark, was recently destroyed by fire, the loss amounting to $4,000. Mr. Clark expects to rebuild.

Label & Fergues Company, Limited, 97 Van Horne Ave., Montreal, P. Q., are drawing up plans for the erection of a sash and door factory, two storeys, 150 x 155, to cost $5,500.

The Miramichi Lumber Company, Chatham, N.B., is applying to the Dominion Parliament for authority to construct piers for boomage purposes on the north side of the Miramichi River, in the parish of Newcastle.

The Scotstown Sawmill Company, Scotstown, P. Q., advise us that the report to the effect that their company has dissolved is incorrect. The change recently made in the company consisted of a change in personnel. Mr. J. W. Taylor and Mr. Wm. Taylor, bought out the interests of Mr. Jas. A. Jamieson. The business is being continued under the same name as formerly.

### Western Canada

W. G. Hopkins, Melfort, Sask., has sold his planing mill to W. McDougall.

The Farmer Lumber Company, Limited, Scott, Alta., recently suffered loss by fire.

The L. C. Parsons Estate, Maple Creek, Sask., lumber and implement dealers, have been succeeded by A. A. Meneley & Company.

The British Columbia Mills, Tug and Barge Company, Limited, has been incorporated in British Columbia with capital stock of $150,000 and head office at Vancouver.

The lumber yard, office and Automobile Sale Building belonging to Grest Bros., at Watrous, Sask., which was recently destroyed by fire, will be rebuilt. It is expected that the cost will be $20,000.

Raven & Mann, New Westminster, B.C., are considering the erection of a lumber mill on the Fraser River in the Mission City District. They intend to erect a plant if they find that they can purchase sufficient standing timber.

A partnership has been formed between Chas. E. Curtis and Delbert H. Sears, both of Qualicum Beach, B.C., as general partners, and Thos. Kinkade, of Little Qualicum River, as special partner, to carry on business under the name of the Curtis & Sears Lumber Company.

The Koprino Lumber Company has secured an extra-provincial license

to carry on business in the province of British Columbia with provincial head office at 509 Richards Street, Vancouver, and F. O. Brodie, Vancouver, attorney for the company. The head office of the company is at Phoenix, Arizona, and its capital stock is $1,500,000.

The Grant Lumber & Fuel Company, Limited, has been incorporated with head office at Winnipeg and capital stock of $100,000. The incorporators include John A. Grant, Wm. Grant, P. W. Grant, W. H. Grant and J. R. Frizell, all of Winnipeg. The company will take over and operate the lumber manufacturing business carried on at Riverton, Man., by the Grant Lumber & Fuel Company.

The Nairn Falls Power and Pulp Company, Limited, have been incorporated with Dominion charter to construct and operate pulp and paper mills. The head office of the company is at Malbaie, P.Q., and the authorized capital is $100,000. The incorporators include L. A. Martin, R. Pepin, L. E. Morin, L. G. Morin and W. E. Morgan, all of Montreal.

The Laminated Materials Company have been granted an extra-Provincial certificate to carry on business in British Columbia, with provincial head office in the Hart Block, Columbia Street, New Westminster. The head office of the company is at 35 Congress Street, Boston, Mass. The company's capital stock is $200,000. Its powers include the manufacturing, buying and selling of goods manufactured from wood or other veneers of any laminated material.

---

The United States Consul at Catania, Italy, reports by cable under date of March 11th, that there are exceptional opportunities in the Catania district for lemon box shooks and pine lumber. Manufacturers should send samples and prices at once.

---

The Peterborough Lumber Company, Peterborough, Ont., have received $1,000 damages in consideration of the damage done their northern timber limits last fall by a fire which broke out on the Government's property and spread to the private property.

---

J. S. Daugherty, Houston, Tex., in a letter to the United States Consul, at Vancouver, states that British Columbia shingles would find a market in Texas. By means of the recently completed Houston canal, an all-water route by way of the Panama Canal could be used by shippers to Texas points.

---

C. H. Ditewig, of Chandler & Ditewig, whoesale lumber dealers, Vancouver and Winnipeg, has severed his connection with this firm in order to engage in the lumber business in Seattle. Geo. R. Potter, former prairie representative of the Adams River Lumber Company, now has charge of Mr. Chandler's Vancouver office.

---

United States exports of wood, lumber and their manufactures during January, 1915, amounted in value to $3,000,000. During January, 1914, the value was $7,500,000. For the seven months ending January 31, 1915, the exports were valued at $29,200,000, and for the seven months ending January 31, 1914, the value was $61,900,000.

---

Wm. Bryenton, a well-known lumberman of Bryenton, N.B., died recently after an illness of about six months. The late Mr. Bryenton was manager of the south-west boom and also operated a mill at Bryenton. He gave up active business some months ago. Mr. Bryenton was 61 years of age and leaves a widow, a daughter and three sons.

---

The board of trade of Nelson, B.C., at a recent meeting passed a resolution submitted by the Mountain Lumber Manufacturers' Association endorsing the action of that association in endeavoring to have the Dominion Government place a duty of $2 per 1,000 ft. on common lumber, rough or dressed, imported into Canada and to enforce the dumping clause.

---

Chief Justice Hunter, of the Supreme Court of British Columbia, has decided that logs when towed are freight, and that owners of tugboats towing such logs failing to secure payment for their services and secure a carrier's lien have priority over a laborer's lien for wages, even though the latter may have been filed first. The decision was based on an English law, the court holding that provincial enactments could not supersede it.

---

The Emerson Lumber Company and Roe & Abernethy are suing the National Finance Company, the North American Securities Company and Alvo von Alvensleben, Limited, and several persons in Nova Scotia, Newfoundland and Ontario for $11,188 due the former plaintiff and $59,607 due the latter. In 1910 the National Finance Company purchased water frontage at Port Moody, B.C., along with buildings, mill, plant, etc., and it is claimed by the plaintiffs that the amounts sued for are still owing on principal and interest.

which will be absorbed at remunerative prices, maintain a stable lumber industry, and permit the practice of forestry upon private lands, than it is to have lumber temporarily chap and later unduly high, because reckless competition has made conservation impossible.

TENTH—The lumber industry in the future must co-operate much more effectively than in the past through associations of producers. Alone the individual timberland owner or lumber manufacturer is helpless. United with his fellows in the same region or line of activity, he becomes a force which can do much.

No association of lumber manufacturers is accomplishing its legitimate purpose which among other activities, does not collect and publish complete, accurate, and detailed statistics upon production, shipments, stocks on hand, and market prices. Nor is a member of an association who neglects or refuses to do his part in supplying necessary reports of this character deserving of any sympathy when he complains—as he often does—that association membership is of no value. If he gives nothing, he is entitled to nothing.

Lumbermen must learn what other successful manufacturers knew long ago—that in order to make money, money must be freely spent for promotion. The cypress manufacturers recognized this law of business when they levied association dues of 25 cents a thousand for 1915. Experience has taught them that association dues are a profitable investment—not at tax.

The faithful observance of these ten prescriptions may not relieve all the troubles of the patient, but they are offered in good faith and it is believed that they possess sufficient curative properties to warrant a trial.

## The "Foster" Fan for Saw Mills

The accompanying illustration shows the "Foster" fan which has been placed on the market by the Toronto Blower Company. This blower is meeting with remarkable success. It is designed and constructed throughout upon scientific principles and the company state that it is the only non-centre suction fan in existence. It is covered by patents both in Canada and the United States.

The "Foster" blower handles any conceivable material without clogging, as the entering material does not pass through or around the wheel, as is the case in centre suction fans. In the "Foster" suction fan the material is at once discharged through the outlet duct which is adjacent to the inlet. The "Foster" blower shaft extends through the centre of the fan and is fitted with ball bearing on either side of the fan case, thus doing away with the over-hung wheel, so that there is no heating, clogging or shaking. These blowers are particularly adapted to sawmill requirements. Many of them have been installed in Ontario sawmills to blow the green sawdust which formerly was removed by means of a conveyor. The Toronto Blower

The "Foster" Fan.

Company manufacture a special heavy sawdust blower for this purpose. The fact that the "Foster" blower accomplishes all this with fifty per cent. less power than other blowers is creating a large demand for this machine, and has obliged the company to extend its plant. The Toronto Blower Company are rapidly outgrowing their present quarters, a fact which speaks well for their success and for the value of the "Foster" fan, during such times as the present, when general business is so greatly reduced.

# A Customer's Opinion of Moreau Barkers

The Moreau Barking Machine is something quite different from any other rossing device.

It has a capacity of from 2 to 3 cords per hour and only requires 6 H.P. to operate it, and it eliminates the time consuming and costly operation of boiling logs.

The Moreau Barker only diminishes the log 18 per cent. as compared with a loss of 25 per cent. to 30 per cent. by other barkers.

The Moreau is an Automatic Barker and its working efficiency is not dependent upon the operator. This feature is particularly advantageous when the logs to be barked are crooked.

Used in conjunction with a pulp wood plant the Moreau Barking Machine will show surprising results. A valuable feature of this outfit is that it is readily portable to any point in the woods—at the railway siding or wherever shipping facilities are offered. Its own weight is sufficient to hold it in place when in operation.

The
St. Simeon Lumber Co.
Limited

Doreil, P. Q. January 30, 1915

Mr. Chas. Manseau, Sales Manager
The Moreau Barking Machine Co., Ltd.
Drummondville, Que.

*Dear Sir:—*

*We beg to acknowledge receipt of your favor of the 20th inst.*

*We installed six Moreau barkers in May, 1907 and since that date we reckon that each of these machines has barked 15,000 cords of wood, costing on an average from 40 to 45 cents a cord, according to circumstances. Maintenance for each of these machines amounted to from $5 to $6 per year. We reckon the loss of wood through barking averages about 18%. These machines have proved so satisfactory to us that our firm, having decided to build a new mill, will install 8 or 10 of these Moreau barkers in it.*

*Yours very truly*

# "That little Book is too good to lose!

Get a copy of the "Belting Manual" and be sure to preserve it. It's the "how" book on belting transmission, it tells:

—how to select belts.

—how to install, lace and care for belts.

—how to make belts endless on the pulleys.

—how to find the width, speed and horse-power of belts.

—scores of other "hows" which are constantly coming up in your Power Transmission problems.

## The "Belting Manual"

with its 96 pages is the most thorough and concise book of its kind, giving all the needed information in the shortest and simplest fashion. It gets right down to bed-rock and is unusually complete with authentic mechanical rules and tables.

We want every belting user to have a copy of the "Belting Manual". If you haven't one send the coupon or use your letterhead, and the book will be sent by return mail.

Waterous Engine Works Co.

# Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

# Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

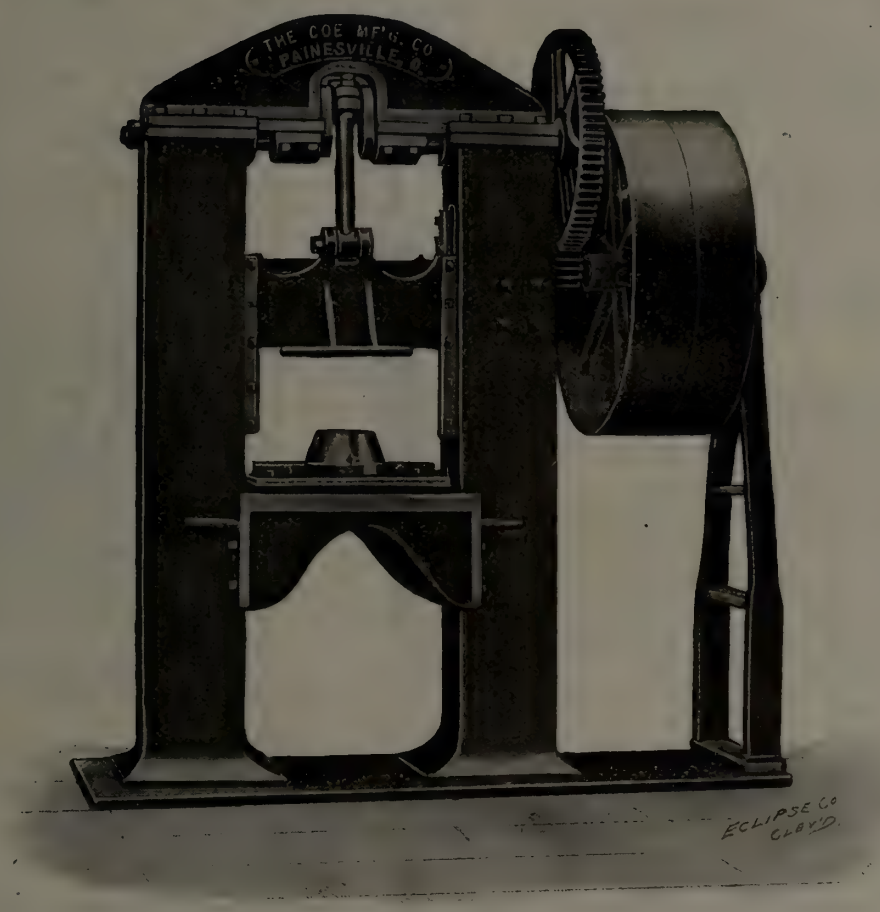
# Veneer Coe Machinery

# Hollow Die Stamping Machine

**Heavy Strong Massive**



**Basket and Package Dies**

Style "B" Weight 4,500 pounds

This machine was especially designed for use in basket factories for making "Climax" bottoms and covers, taper peach basket staves, berry box patterns, grease and butter packages, bottoms and covers for other packages of any shape.

Its cutting capacity is from 50,000 to 400,000 pieces per day of ten hours, the output, of course, depending on the thickness of stock used.

We can equip the machine with any number of special dies to do your work. All we need are samples of the work you have to do, and we will make the dies to do it.

The machines are very heavy and strong, and with proper care will last a lifetime.

A line to us will bring full detailed description of all or any one of the Coe Machines, Rotary Cutter, Slicer, Drag Saw, Knife Grinder, Clipper, Wringer, Roller Dryer. ***Catalogue on request.***

# The Connecting Link

Way back in 1880 the **Wanted and For Sale** columns of the Canada Lumberman and Woodworker were used extensively by the lumbermen of Canada for the purchase and sale of timber, lumber and machinery.

Time has but served to enhance the value of this medium, until to-day the **Wanted and For Sale Department** of the Canada Lumberman has become a national market.

Twice a month "the paper with the green cover" brings together buyers and sellers of lumber and machinery from all the principal lumbering centres of Canada and the United States. By covering this wide field, the percentage of waste circulation for advertisers has been reduced to a minimum.

For quick and satisfactory results, get your advertisement in the **Wanted and For Sale Department** of the

# Do Your Men USE or ABUSE Their Files?

The correct USE of a file is to retain it on a certain class of work until its efficiency is impaired. When it reaches the point where it requires more effort to remove less stock, it should be promptly replaced with a new one.

The ABUSE of a file is its retention *after* it has passed the "impaired efficiency" point. It is no longer able to operate swiftly, accurately nor economically. The expensive time and labor it wastes more than offsets the costs of several new files.

Investigate filing conditions in your plant. See if your mechanics are *using* their files *to your profit*—or *abusing* them to *your loss.*

Insist that all files be replaced *promptly* —preferably with the

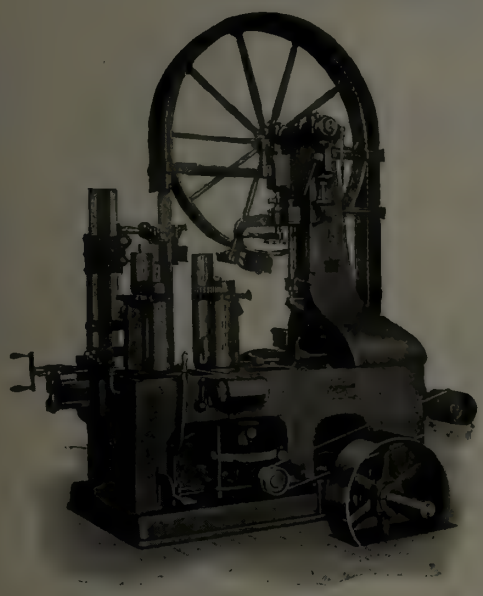
*a Specialty in the* BAND RESAWS *line*

SOUTHERN BRAZIL LUMBER CO.

Tres. Barras, Brazil,
Nov. 14, 1914



New Standard 60-in. Band Resaw.

Gentlemen,—

Replying to yours of October 8th, will say that the three Band Saws shipped by you and erected by us at this place are doing perfect work and giving every satisfaction — in fact, we would not think of duplicating this plant without duplicating the machines.

We further wish to state that among all the exporters that we have had anything to do with in erecting this plant, at this point, your shipments have been received by us in the most satisfactory manner.

Yours truly,
SOUTHERN BRAZIL LUMBER CO.

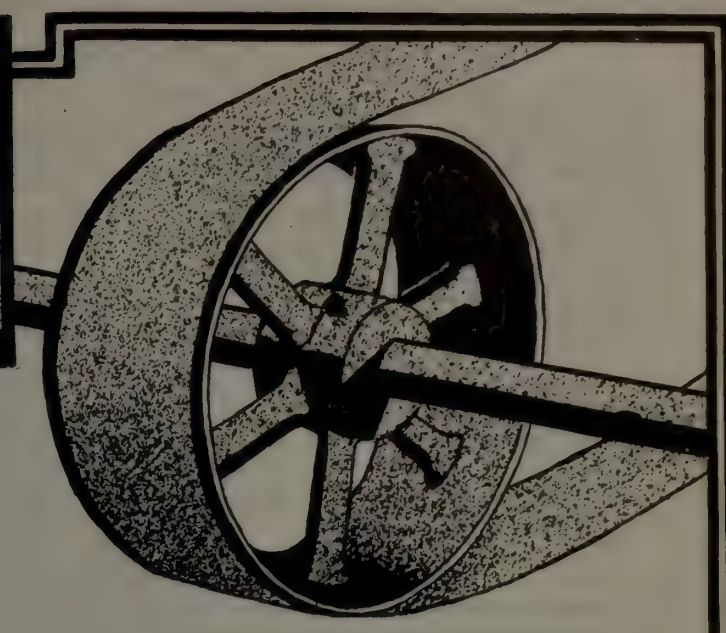
# "Wilson Bros." Flooring and Trim

"Wilson Bros." stamped on every piece of this flooring stands for Quality. Look for the name. Hardwood and Pine. **Interior Finish of All Kinds.** Also Hardwood Veneer Doors to detail. We are equipped to fill large or small orders on short notice. Write us for prices.

**Wilson Bros., Limited - Collingwood, Ont.**

When You Overhaul Install

GOODHUE BELTS



# "Acme Waterproof" Leather Belting

This brand is especially well suited to the wet places in a saw or pulp mill and will run true as long as it is in service. When you are overhauling your mill equip it with "Goodhue Belts" and you will never regret it. They are honestly made of solid leather—every inch a good belt and they won't stretch.

***Get our details and prices.***

## J. L. Goodhue & Company, Limited

DANVILLE - QUEBEC

OUR long experience with the particular requirements of the Lumber Industry of Canada places us in a position to give you exactly what you require for your particular work.

We have lately opened a branch at Hull, Que., where a full line of cross-cut saws, bits, holders, etc. is carried. A fully equipped repair department is in connection for the convenience of our many customers in that section of the country.

Our Vancouver Branch is similarly equipped.

You are assured ***Prompt Attention*** and ***Immediate Delivery.***

**Not altogether what we say but what users say**

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

**West & Peachey - Simcoe, Ont.**

"To be, or not to be, that is the question.
Whether 'tis nobler in the mind
To suffer the slings and arrows
Of outrageous fortune,
Or to take arms against a sea of troubles." —Hamlet.

**Hamlet the Prince of Denmark is a character which**

every budding actor aspires to play. The late Sir Henry Irving certainly inspired many to study the works of Shakespeare and those who were privileged to hear him in Hamlet's famous soliloquy are not likely to forget it. Most of us have been in a state of doubt on many occasions and said to ourselves: The question is:

**TO BE, or not TO BE**

We can serve the interests of our customers who use Babbitt Metals and recommend without any hesitation.

**Harris Heavy Pressure**

*The Babbitt Metal Without a Fault*

**Engineers using H. H. P. avoid a sea of troubles. They know IT WILL GIVE EXCELLENT SERVICE**

**The World's Largest Chain Makers** **Pittsburgh**

# The Steam Tension Band Mill

It is called the steam tension mill because the tension is maintained by steam—the most sensitive form of tensioning which has been devised.

The result of this is a great saving in saws—**several users of the machine have run through an entire season without cracking a single saw.**

But in addition to raising and lowering the top wheel by steam, there is a separate cylinder for operating the top guide, and these two cylinders make ours an entirely steam-operated mill, and, therefore, exceptionally fast.

It is made with 8 ft., 9 ft. and 10 ft. wheels, and will stand thorough investigation.

Write for bulletin and list of users.

On Your Direct Drives
**SCANDINAVIA BELTING**
will give you good results at a low cost.

Scandinavia Double Belting is from 30% to 40% cheaper than double leather belting and will transmit the same power.

The lasting powers of this belt on drives of this nature are enormous. We have published a book on belting which gives a lot of information on this. It is free.

FEDERAL ENGINEERING Co
LIMITED
TORONTO AND MONTREAL

**This engine is 13½ ins. x 18 ins. and weighs 35 tons.**

The knowledge and experience of fifty years in locomotive designing and construction is what you get in our Logging locomotives. They are specially constructed for logging operations and will stand up to the severe service in which they are expected to run. Oil or coal burning.

They are as carefully designed and built as our 200 ton locomotives. Repair parts may always be obtained on the shortest notice.

**Grey Iron Castings—any size or shape—ordinary or intricate—made promptly. New foundry, splendidly equipped. We would be pleased to quote on castings—singly or by contract. We also make drop forgings of all descriptions.**

**MAY WE SEND YOU SPECIFICATIONS?**

**Canadian Locomotive Company, Limited, Kingston, Ont.**
**Taylor and Arnold Ltd., Sales Agent, Montreal and Winnipeg**

***The Mark*** ***of Quality***

When you buy saw mill machinery, you use, of course, the same care and judgement as a woodsman in selecting an axe, or a carpenter a chisel.

A good workman demands good tools, and, as a rule, knows the reliable makers of his particular line.

In 1915 we are doing "business as usual," and why not? Does it not stand to reason that saw mill machinery can best be built by those engaged in manufacturing this line exclusively, and in a shop ***built*** expressly for this service?

# Made in Canada

# "AMPHIBIA"

# The Waterproof Belt That Grips Your Pulleys

In buying a belt remember that you are not making a purchase where a few dollars saved on a lower grade article is a real saving. You are buying a medium to carry the most expensive thing in your plant—power. Nothing but the very highest grade of leather belting should be tolerated.

"AMPHIBIA" waterproof leather belting is pliable, firm with minimum stretch and maximum tensile strength and durability. "AMPHIBIA" grips the pulleys perfectly and transmits more of your power than other belting.

"AMPHIBIA" belting is particularly suited to the difficult runs in saw mills, pulp mills, veneer plants and other industries where wet or green lumber is handled.

When ordering state where the belt is to run.

***Write us for prices.***

## To the Owner of Timber Lands

Far sighted owners of timber lands should take advantage of the times incident to the European wars, and prepare themselves for the day when the demand for timber is suddenly thrust upon them. This is certain to come at no distant day. Therefore cultivate a closer acquaintance with your holdings, and the best method of marketing them. Let us prepare the way for you. Remember, we not only report on the property, but assist in marketing the bond issue when necessary. Send for our booklet.

# *Arkansas Soft Pine*

"Cream Brand" Arkansas Soft Pine, a selected grade, similar in character and appearance to the old cork pine of the north, is now offered the building and factory trade of North America.

This grade was created in response to the wide-spread demand for stock suitable for enamel work and that exactly is the purpose for which it is being and should be used.

Architects are seeking the one wood that will take enamel to their satisfaction. They welcome the advent of the Cream Brand for it is exactly what they want.

It comes from "just under the bark" of large, old growth logs, is light, white and free of pitch and contains very little summer growth wood.

For enamel or paint there is nothing better on the market. Write the mills for information, for

# A Customer's Opinion of Moreau Barkers

The
St. Simeon Lumber Co.
Limited

Doreil, P. Q. January 30, 1915

Mr. Chas. Manseau, Sales Manager
The Moreau Barking Machine Co., Ltd.
Drummondville, Que.

*Dear Sir:—*

*We beg to acknowledge receipt of your favor of the 20th inst.*

*We installed six Moreau barkers in May, 1907 and since that date we reckon that each of these machines has barked 15,000 cords of wood, costing on an average from 40 to 45 cents a cord, according to circumstances. Maintenance for each of these machines amounted to from $5 to $6 per year. We reckon the loss of wood through barking averages about 18%. These machines have proved so satisfactory to us that our firm, having decided to build a new mill, will install 8 or 10 of these Moreau barkers in it.*

*Yours very truly*
*The St. Simeon Lumber Co., Ltd.*
*Doreil*
*Per Alf. Garneau*

The Moreau Barking Machine is something quite different from any other rossing device.

It has a capacity of from 2 to 3 cords per hour and only requires 6 H.P. to operate it, and it eliminates the time consuming and costly operation of boiling logs.

The Moreau Barker only diminishes the log 18 per cent. as compared with a loss of 25 per cent. to 30 per cent. by other barkers.

The Moreau is an Automatic Barker and its working efficiency is not dependent upon the operator. This feature is particularly advantageous when the logs to be barked are crooked.

Used in conjunction with a pulp wood plant the Moreau Barking Machine will show surprising results. A valuable feature of this outfit is that it is readily portable to any point in the woods—at the railway siding or wherever shipping facilities are offered. Its own weight is sufficient to hold it in place when in operation.

# Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

**We have the following Sawmill Machinery for sale:**

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

## FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

## POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

## The "Berlin" Line

**All Types of Planing, Sanding and Sawing Machinery for Sawmill, Planing Mill and Factory.**

**Investigate Berlin Machines for Your Needs.**

### Berlin Machines Were First Built at Berlin, Wis., U.S.A.

The name "Berlin" has been closely associated with the woodworking industry ever since the first power feed drum sanding machine was built in a little shop at Berlin, Wis., U.S.A., nearly thirty-five years ago.

Later the company moved from the little town that gave the concern its name—"Berlin" Machine Works. They added to their line—began building and perfecting planing and sawing machinery as well as sanders.

For years they manufactured woodworking machinery of various types for saw mill, planing mill and factory for the U. S. and Canadian trade at their Beloit, Wis. plant.

Then the desirability of handling Canadian business from a directly-in-Canada organization became evident. A branch factory with offices was built in Hamilton, Ont., in 1908, which to-day is one of the best equipped plants of its kind in Canada.

Every Canadian woodworker should have a general catalog of Berlin Canadian built Woodworking Machinery.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

# Difficulties in the Way of Pit Prop Trade

During a discussion of the lumbering industry which took place recently in the House of Commons, and which is reported elsewhere in this issue, Sir Geo. E. Foster, Minister of Trade and Commerce, in reply to Mr. J. H. Sinclair, the member for Guysborough, N.S., made an interesting reference to the pit prop situation. It will be recalled by readers of the Canada Lumberman that the mine owners of Great Britain found their supplies of pit props seriously reduced after the outbreak of the war, and that a Commission representing the mine owners and the British Board of Trade came to Canada to enquire into the possibility of securing supplies of pit props in this country. Although reports were published by the commission to the effect that large supplies were available in eastern Canada and in British Columbia, very little trade has resulted. Sir Geo. Foster ascribed the lack of trade to the difficulty in securing vessels for shipment; to the difficulty in securing a sufficient supply of pit props ready for the market at the time, and to the reluctance of Canadian operators who were unwilling to take contracts for a short period of time. It was not known when the war would end and possibly put an end to the demand for Canadian pit props in Great Britain by releasing the large supplies available in the European countries from which they were formerly obtained. The upshot of the discussion was that an impression was given that the trade was not one which is likely to become extensive, because it is uncertain under present conditions. The opinion, however, was also expressed that in future there is a possibility that the prices of the supplies of pit props to be secured from Europe will be higher than they were before the war and that Canadians will then have an opportunity to secure part of the business. If this is the case, an important trade will be opened up which will be of great advantage to Canada.

One of the most interesting features of the discussion had to do with the matter of inspection. Mr. E. M. MacDonald, of Pictou, N.S., expressed the opinion that the necessity for having pit props inspected in Great Britain was really at the bottom of the failure of Canadian trade in pit props to develop extensively. The operators who came to Canada to conduct the business had insisted upon inspection in Great Britain. Canadians could not enter the trade under such conditions, as, in case stocks of pit props were refused after inspection in Great Britain, they could not be sold for any other purpose, and would be a dead loss. If inspection could be arranged on this side the difficulty would be overcome, and he believed that a good trade would develop. Sir Geo. Foster remarked that if this were the chief obstacle it could be easily removed, as the Government would be quite willing, if other conditions were made right, to undertake to have the inspecting done on this side, and done under specifications given on the other side, just as the Government had done in some other cases.

The trade in pit props is an exceptionally large one, and from the information which has been brought to light by the reports of the English Commission, and by the discussion in the House of Commons, it appears to be important that the Government should make as full investigations into the situation as possible. Mr. H. R. MacMillan, who has now commenced his visits to our export markets, will have an opportunity to investigate this matter when he reaches Great Britain, and it is to be hoped that he will be able to find a solution of the difficulty which will enable us to secure a good share of this extensive trade.

# Developing Our Export Markets

The announcement recently made by Hon. W. R. Ross, Minister of Lands for British Columbia, that Mr. H. R. MacMillan is being sent to Australia by the Dominion Government as a special commissioner on behalf of the lumbering industry in Canada, has been received by lumbermen in all parts of the country with approval, inasmuch as it indicates the willingness of the Government to co-operate with Canadian manufacturers in their efforts to enlarge their export trade. A further announcement upon the same subject which was made subsequently in the House of Commons by Sir Geo. E. Foster, that Mr. MacMillan will visit not only Australia, but the chief lumber importing countries of the world, is the most encouraging piece of news that lumbermen have received for many months. In addition to Australia, Mr. MacMillan will visit such countries as China, Japan, India, South Africa, South America, France and Great Britain. With his special knowledge of the lumbering industry in many parts of Canada he will be in a position to send back to the Government reports which will be exceptionally valuable to the lumbering industry.

The lumbering industry in Canada has come very suddenly to the parting of the ways in connection with the disposal of its surplus product. Especially is this the case in the west. In the east the export trade has been developed and organized to a great extent during many years, but in the west the lumber trade has been existing to a great extent upon the demand for lumber caused by the rapid building up of the prairie provinces. For some years the future of these provinces looked so bright that the lumber industry in British Columbia felt that it could count upon a continued and rapidly expanding demand for its output. The capacity of the mills was increased. New mills were built, and for a time the prairies took a large portion of the output. But the United States mills soon invaded the market, reducing the volume of trade secured by British Columbia mills and cutting down prices. Then came the decline in immigration following the end of the boom, and this was closely followed by the outbreak of the war, so that the mills in the west today find their markets on the prairies reduced to a mere shadow of their former greatness.

Development of the export trade is the only solution of the difficulty. If we could count upon a continuous demand from the prairies the situation might be different, but we cannot, and moreover, even the prairie demand would not be sufficient to make profitable trade for British Columbia mills and the United States mills which periodically go after it. By working up export markets it will be possible to provide a steady outlet for the products of British Columbia coast mills. Moreover, this outlet, being dependent not upon any one export market, but upon a number of them situated in various parts of the world will not be nearly so liable to disastrous fluctuation in prices

and demand as one market alone. A substantial volume of export trade in lumber, once it has been worked up by the British Columbia mills, will place the industry on as safe a basis as it can be placed upon. When the coast mills of British Columbia have reached this position mills of the mountain district will be left to take care of the prairie trade and will benefit by the removal of the competition which they formerly experienced from the coast. It is reasonable to believe that the United States mills which are also paying great attention to the foreign markets will travel along a somewhat similar line as time goes on, and that the invasion of United States lumber into the prairies will not be so extensive as it has been in the past. All this depends, of course, upon a successful working out of the export trade by both countries. There seems, however, to be good reason for looking forward to such a development with confidence. The fact that the Canadian Government has stepped forward in support of the Canadian lumbering industry should mean that Canadian interests in the export markets will participate fully in the increased trade which is likely to be developed.

In any such matters as this it is easy enough to make a great deal of talk and to accomplish very little. We might do much in the way of seeking foreign markets for our lumber and not meet with much success, unless all the conditions were suitable. The conditions prevailing today are probably as encouraging as they could be. In the first place, the selection of Mr. MacMillan is most fortunate. There is probably no man in Canada who is better equipped both by acquaintance with conditions in Canada and by energetic determination to make the best of the situation, to undertake the work of interesting foreign markets in Canadian lumber products. In the second place, reports which have been received from our trade and commerce representatives in foreign countries for some months past have been remarkably full of information of an encouraging nature in connection with the lumber trade, showing that we have been neglecting our opportunities in the past. The demand already exists in many of these markets for such lumber products as Canada can ship to them and unless we are quick to take advantage of the opportunities other countries will secure a strong hold upon the trade and it will be too late.

Mr. MacMillan will return to Canada in the course of six or eight months with a great deal of practical information in regard to the demand in each country which he visits, and the manner in which it can be filled by Canadian products. This information will be placed at the disposal of the lumbermen of Canada as quickly as possible. Moreover, Mr. MacMillan will be able to suggest means whereby the Canadian Government and the Canadian lumbermen co-operating with one another can best advertise their products in these markets. We will no longer be working largely in the dark as we have during the past. We will know where the demand is and how to fill it. This knowledge will not only apply to the case of British Columbia and its foreign markets, but to eastern Canada and the markets to which it has been shipping its lumber for many years, as well as to new markets which have only been lightly invaded by Canadian lumber. Without being unwisely optimistic it is reasonable to feel that Canadian lumbermen, assisted by the Government, will be able to develop their export trade to such an extent as to put an end to a large extent to the violent and all too frequent fluctuations which have occurred in the demand for their products during the past.

# A "Combine Against" Not "in" the Lumber Trade

It is difficult to imagine how Hon. Frank Oliver, ex-Minister of the Interior, can have persuaded himself that he had any fair reason for making such an attack upon the lumber industry of Canada as he did recently in the House of Commons when the discussion of the war tariff duties was in progress. Lumbermen have become so accustomed to hearing their business interests attacked that they did not pay a great deal of attention to Hon. Mr. Oliver's statement, but as it was made by an ex-Minister of the Interior, who should have been in possession of definite facts upon the question which would have shown him the folly of his attack, it is serious enough to require considerable thought on the part of lumbermen. Hon. Mr. Oliver's remark to which we have reference was in the form of an objection to a duty upon lumber entering Canada, because of the existence of an alleged "lumber combine." Readers of the Canada Lumberman are practically all conversant with conditions in connection with the lumbering industry of Canada and there is no necessity to refute such a charge in these columns. Yet, in the hope that this article may come to the attention of some who are not so well posted as most of our readers, and who may have been inclined to think that, when an ex-Minister of the Interior made such a statement there must be some truth in it, we are disposed to make reference to a few of the actual facts in regard to the lumber trade.

Here is the situation of the lumbering industry in Canada, in a few words only, as it appears to the Canada Lumberman, and as everyone who is in a position to know about it realizes to be the actual case. Commencing in the Maritime Provinces, the lumbering industry, which has been branded as a "combine," consists of many hundreds of manufacturers, retailers and wholesalers whose trade interests are as diverse as possible. They ship their goods to foreign markets wherever they can find an opportunity for developing trade. They ship also to many parts of Canada and they compete in such localities as the province of Ontario, where their spruce products during 1913 and 1914 cut into the market for Ontario lumber so extensively as to make the trade in many cases unprofitable. They meet in Ontario also the competition of many varieties of United States lumber, chiefly southern pine. This competition is of the keenest description, and is of itself sufficient to prevent the organization of anything in the form of a "combine." The lumbering industry of New Brunswick has been subject to such fluctuations in the price of its product from year to year that the very thought of a "combine" is absurd. Even at present, when for the first time in many years there is a good demand for New Brunswick lumber in Great Britain and France, the cost of shipping has become so abnormally high that the trade is badly handicapped.

In Ontario, the lumbering industry manufactures stock for the United States, Great Britain, and Canadian markets chiefly. In all these markets its products meet strong competition from the products of other countries and other parts of Canada. In Ontario itself, the prducts of eastern Canada, British Columbia and United States all compete with those which are manufactured within the province. It would take an organizing genius such as the world has never yet produced to work out any kind of an arrangement which would bear the remotest resemblance to a "combine" in the Ontario industry. In the markets of Quebec province much the same conditions exist. The competition from many sources is very extreme. By way of an interesting side light upon the competition in Quebec, although not by way of an actual demonstration of it, we may mention that a few years ago we saw during a visit in the city of Quebec, samples of British Columbia lumber and samples of white pine from Manchuria. These two products between them had circled the globe in order to arrive at the market of Quebec, the one time home of the greatest white pine exporting trade in the world.

But if anyone who thinks there is a "lumber combine" in existence in Canada wants the most definite proof of his mistake he has only to enquire into the situation in western Canada in order to have his eyes opened. In the prairie provinces lumber from British Columbia, Ontario, the Western States and the Northern Middle States have all competed for the trade to such an extent that many of the largest and apparently the soundest lumber manufacturing and selling institutions in British Columbia have recently been forced into liquidation. Even in the best of times British Columbia has only been able to find a market for two-thirds of the lumber which it has been capable of producing. One-third of the capacity of the British Columbia mills has been obliged to remain idle, or else the surplus of its production has been forced upon an overstocked market. The trade in western Canada is in such a bad situation as a result of the real estate boom and the breaking out of war, that "stag-

nation" has been a more fitting description of its situation tha nany other term.

It is encouraging to note that the Government of Canada has attached no importance to the assertion that a "lumber combine" exists, but has decided that the lumber trade needs its assistance in searching out foreign markets for Canadian lumber so that we may be able to export some of our surplus product instead of sacrificing it upon Canadian markets. In short, far from there being anything in the nature of a "lumber combine" in Canada the situation really is that natural conditions resulting in competition from many sources of supply, combined with the former neglect of Canadian Governments to protect the industry against foreign competition, and also combined with the fact that practically every other industry in Canada is protected, have actually produced the effects of a combine against the prosperity of the lumber manufacturing and selling business in Canada.

## SERVICE FIRST

The value of a trade journal is measured definitely by the service which it can render to its readers. The Canada Lumberman has realized this during all the years of its existence and has made a practice of publishing only such articles and news as are of practical value to lumbermen. There are two ways in which a trade journal can furnish service. One is by means of publishing good, practical articles. The other is by acting as a source of information in reply to enquiries from its readers.

A trade journal ought to make a specialty of inviting enquiries of this nature. A journal like the Canada Lumberman, which has been in existence for many years, and has secured the confidence and support of the industry in all parts of Canada, is in an exceptional position to secure information upon any subject which is of interest to lumbermen.

We desire to impress this point upon our readers so that they may realize more fully our desire to be of service to them. The answering of enquiries is a variety of service specially belonging to a trade journal. It results not only in a service to the reader, but also in a broadening of the facilities of the journal itself, placing it that much more fully in touch with its field. We receive enquiries from many of our readers and in most cases are able in the course of a comparatively short time to furnish replies which are valuable and which it would be difficult for the individuals to secure without the expenditure of much trouble and time.

The Canada Lumberman is the recognized medium of information for the lumbering industry throughout Canada. We cannot always know just what our readers would like to have information upon and we hope that they will make full use of us by asking questions whenever they want information, and giving us in this way an opportunity to prove our facilities for giving service.

### B.C. Lumber Exhibits in Important Centres

Twenty-four sets of exhibits of the products of the British Columbia lumbering industry have been prepared by the Forest Branch of the British Columbia Department of Lands, These exhibits will be sent to Canadian trade commissioners in various parts of the world. A number of them have already been forwarded to the Orient and others are to go forward shortly. Mr. H. R. MacMillan, Chief Forester for British Columbia, in explaining the exhibits, states that they are to be enclosed in large cases suitable for display and to receive a permanent position in the offices of the various trade commissioners. They will be located at such places as Yokohama, Shanghai, Hong Kong, Melbourne, Sydney, Durban, Johannesburg, London and Paris. The exhibits were arranged with the co-operation of the manufacturers of British Columbia and embrace all the important woods in finished and unfinished form, together with information as to the uses to which the timber can be put. Each case contains a number of panels finished in a variety of ways, of Douglas fir, spruce, hemlock, etc. The exhibits also include a number of excellent photographs of timber operations in the province, also photographs of stands of timber, giving some idea of the immensity of the supply of the province. Each case also contains six doors hung on a common hinge which illustrate the attractive finishes it is possible to obtain on British Columbia lumber. It is confidently expected that excellent results will come from this effort to place the foreign consumer in touch with the supplies which can be obtained in British Columbia. Mr. MacMillan sailed on April 6th upon his tour round the world, as a Canadian trade commissioner with instructions to enquire into trade opportunities for the lumbering industry of Canada. He intends to pay particular attention to the placing of the British Columbia exhibits in the most effective quarters.

---

### Improved Conditions in the United States

The London Statist, in a recent issue, calls attention to the improved industrial and financial situation in the United States in a forcible manner, showing the great change that has taken place in a few months. After reviewing the chaotic conditions in United States trade last summer, and the gloom and uncertainty which then prevailed, the Statist says "No greater contrast to this situation could be afforded than the one now existing. Confidence in the United States has been completely restored; almost the whole of the emergency currency notes have been retired. Indeed, the volume of American exports is so great that the United States is not only able to meet its obligations to other countries for interest and services, but to lend large amounts of capital to foreign nations. Furthermore, the outlook is that the United States in 1915 will sell goods to foreign nations to an amount so vast that they will be in a position to buy and to pay for great quantities of securities, as well as to import considerable amounts of gold." The article in question further points out that there was a balance of trade in favor of the United States in January of $100,000,000, and predicts that during the present year the United States will invest upwards of a billion dollars in foreign securities, or in its own securities held abroad.

---

### Sailing Vessels Again in Port

Mr. F. M. Tweedie, Mayor of Chatham, N.B., in a recent interview stated that the scarcity of steamers for shipment of lumber from Miramichi ports had forced lumber firms to look far and wide for sailing vessels to undertake the carrying trade. One firm, Mr. Tweedie stated, had already secured thirty barquentines and three-masters to handle their output during the coming season. The lumber cut on the Miramichi this year, he reports, will probably be larger than ever before. It has been yarded without difficulty, and if the stream driving is favorable the output will be considerable. Practically all the shipments will have to be made by sailing vessels, as steamers are not available. These sailing vessels, which will now do trans-atlantic trade, have been engaged in the coastwise lumber carrying trade and general freighting business, but the high freights will make the change very profitable. The same conditions will probably apply to the lumber trade from St. John and Bay of Fundy points. This change in the method of making shipments will mean a great deal to the New Brunswick ports. Schooners will be a longer time in port than steamers. They will require more labor, and in practically all cases will purchase supplies from local firms, whereas steamers which formerly carried on this trade were fitted out on the other side and arrived in New Brunswick ports well provisioned for the round trip.

---

Boards of Trade in Montreal, Halifax, St. John and Vancouver, the Canadian Manufacturers' Association and the British Columbia Forestry Office have received copies of tenders and conditions of contract for the supply of telegraph poles for the British Post Office Department. Through the Canadian Commissioner at Paris it has also been learned that the Servian Public Works Department is soliciting offers for the supply of 100,000 railway ties, to be 2 meters in length, 70 by 25 centimeters in width and 16 centimeters in thickness.

# Freight Advances Strongly Opposed

## Toronto Lumbermen Present Arguments and Facts Against Application Made by Railway Companies

The application of the railway companies for permission to increase their freight rates between points east of Port Arthur, which had already been the subject of two sessions of the Board of Railway Commissioners at Ottawa and Montreal was again before the Board at a session held at Toronto on March 29th. Mr. T. H. Marshall, traffic expert of the Toronto Board of Trade, placed before the Commissioners a resolution passed by the Lumbermen's Section of the Toronto Board of Trade, as follows:—

Whereas the Canadian railways have made application to the Board of Railway Commissioners for Canada for a general increase in freight rates, and this proposal includes an advance in rates on lumber and other forest products, averaging $2.00 per car, and

Whereas under existing circumstances it is extremely difficult to market lumber at prices lower than obtained during 1914, owing to the present industrial depression and general stagnation in the building trade, an increase in the present handling charges through advanced freight rates would mean a very considerable loss to the dealers, and

Whereas from statistics obtained from some twenty-five retail lumbermen and manufacturers, members of this section, it would appear that in 1914 these dealers and manufacturers received approximately 12,425 cars, representing—as near as can be conservatively estimated—twenty-five per cent. of the total receipts of lumber and other forest products at Toronto, an advance of $2.00 per car would mean approximately $100,000 additional expense to the dealers, and with the knowledge that these figures can be confirmed from the railway companies' records, the short time at our disposal precluding our obtaining further authentic statements from all dealers, and

Whereas the rates on lumber were advanced in 1908 to what we consider is the maximum transportation tax which these commodities should be called upon to pay, be it

Resolved that the Lumbermen's Section of the Toronto Board of Trade now in session do unanimously and most emphatically protest against any further advance in freight rates on lumber products as proposed by the railway companies, and be it

Further resolved that a copy of this resolution be placed in the hands of the Board of Railway Commissioners for Canada.

### Summer Export Rates

Mr. Frank Hawkins secretary of the Canadian Lumbermen's Association, asked that the railway companies should make a statement in regard to export rates upon lumber during the summer. Formerly the summer rate from Ottawa Valley points to Montreal for domestic shipments was six cents a hundred pounds and the export rate was five cents. This rate was put into effect by the railway companies filing special summer tariffs. The Board had held that it had no power to compel the railway companies to file such a tariff, based upon water competition which the railway companies might or might not acknowledge. The winter rate from the Ottawa Valley to Montreal for domestic shipments was seven cents a hundred pounds and by order of the Board the export rate must be one cent lower than the domestic. This year the railway companies had not filed any special summer tariffs and as the season was advancing Mr. Hawkins asked that they should make an announcement upon this point. After a considerable discussion upon this subject the Chairman of the Board directed the railway companies to keep an account of their traffic, both export and domestic, during the coming summer, so that they might know exactly where they stood. He directed them to maintain the present difference between export and domestic rates for this purpose and to absorb whatever charges they were already absorbing.

Mr. Hawkins then presented a statement showing the actual shipments of lumber, lath and shingles from the Ottawa Valley firms during the year ending June 30th, 1913, taking this period, because the succeeding year was an abnormal one. The statement showed that twelve leading manufacturers had shipped 15,520 cars of lumber, the estimated weight of which was 654,425,449 lbs. The increased freight charges upon these shipments, based upon an advance of one-half cent per hundred lbs. would involve the sum of $32,721.23. This statement is based upon the following estimated weights:—2,500 lbs. per M. feet of lumber; 400 lbs. per M. pieces of lath; 250 lbs. per M. pieces of shingles.

Mr. Hawkins then pointed out that the C. P. R. had paid dividends right along and had put aside millions of dollars to the credit of profit and loss. The present rates, therefore, were sufficient. He also stated that the G. T. R. received 43½ per cent. of its tonnage from the United States. He presented next a comparison between the track mileage of Ontario leaving out the section west of Sudbury and the whole of the transcontinental railway, with the track mileage of the State of New York. In Ontario they had 7,000 miles of tracks. In the State of New York, which is of about the same extent of territory, they had 8,500 miles which served a population of something like 9,113,000, as compared with a population in Ontario of 2,500,000. From this it would appear that we were about fifty years ahead in railway construction in Ontario, a fact which might have a great deal to do with the desire of the railway companies to increase their freight charges.

An interesting point was made by Mr. Hawkins in regard to the outlook for improved trade conditions, his idea being that the railway companies could look forward to a decided improvement in their volume of business during the coming year. Mr. Hawkins quoted an interview appearing in the daily press with Mr. Neil Mooney, general agent of the New York Central lines. Mr. Mooney stated that on account of the war it was altogether likely that the volume of travel usually going to Europe in the summer time would remain on this side of the ocean during the present summer and that there would be $500,000,000 spent upon travel in the United States and Canada during the coming season.

Mr. W. J. Smith, of J. B. Smith & Sons, presented a forcible argument from the lumbermen's point of view.

Mr. Smith asked how the railway companies could expect his company to pay the proposed increased freight rates from Callander, Ont., in view of the following facts:—That lumber is being moved from New London, Conn., to Toronto, a distance of 710 miles, at 12½c. per hundred lbs., or .352c. per ton per mile; from Jacquet River, N.B., a distance of 834 miles, at 20c. per hundred lbs., or .48c. per ton per mile; from Bathurst, N.B., a distance of 862 miles, at 20c. per hundred lbs., or .46c. per ton per mile; from Campbellton, N.B., a distance of 799 miles, at 18c. per hundred lbs., or .45c. per ton per mile.

The present rates from Callander were as follows:—Callander to Toronto, 220 miles, 10½c. per hundred lbs., or .96c. per ton per mile; from Callander to Holley, N.Y., a distance of 342 miles, 18c. per hundred lbs., or 1.05c. per ton per mile; from Callander to North Tonawanda, N.Y., a distance of 319 miles, 15c. per hundred lbs., or .94c. per ton per mile. The rate from Penetanguishene to Toronto, a distance of 100 miles, was 8c. per hundred lbs., or 1.6c. per ton per mile.

In order to show how cheaply the railroads could move lumber when they wished to do so, Mr. Smith pointed out that southern pine going to Montreal from the Southern States was given a rate only 4c. above the rate to Toronto, and that the railroads were hauling this material 333 miles at 4c. per hundred lbs., equal to .24c. per ton per mile.

He also pointed out that the freight from New London, Conn., and New Brunswick was being hauled up hill, while the freight from Callander goes mostly down hill. During the last few years, the rate from Callander has been increased forty per cent.

In the course of his remarks Mr. Smith pointed out that there were owners of lumber today who had bought in bulk and were finding it necessary to sell at less than the cost price, so that the present was a most inopportune time for talking of increased rates. In his opinion the railroads ought to be able to haul lumber cheaper today than in days gone by, when cars only held twelve tons and when 13 such cars made a train load, whereas the cars of today held from 30 to 50 tons and 40 such cars made a train load.

Mr. G. A. Howell, of the Howell Company, Toronto, presented an argument against the increased rates, on behalf of the pulpwood, pulp and paper trades.

Mr. Howell's objections were to the proposed increase in the combined rate on the T. & N. O. and G. T. R., for hauling pulpwood carloads from T. & N. O. points to the Thorold and Niagara Falls district. The Thorold and Niagara Falls district was the only market for the wood from the T. & N. O. and the price paid by the mills in that district was regulated by the price obtainable for water-borne wood from Quebec. This wood comes up the St. Lawrence by steamer and barge and is unloaded at the Welland Canal or at Tonawanda on the Niagara River, making it impossible for the shipper from T. & N. O. points to increase the price charged to the mills, by the additional freight. Consequently, this increase must be paid by the settler. The increase from Cochrane would amount to 39c. per cord of rough wood and from the Englehart district 26c. The settlers in the Cochrane district were now very heavily handicapped by the freight rates and could barely obtain, at present, prices sufficient to pay them for cutting the wood. If they had to reduce their price by 39c. per cord, which to a settler cutting, say, 100 cords a year, amounted to $39, a large sum to a settler, it would be a question whether he would not find it more profitable to burn up the timber than to cut it and ship it out as pulpwood.

On rossed wood the increase in the Cochrane district would be 37½c., practically the same as on the rough. The price in any event would be governed by the cost of the rough wood. The proposed increase in freight rates, he submitted, would naturally be a hardship to the settlers, and would discourage settlement, which from a railway's point of view should be sufficient to prevent their advancing the rates.

# Toronto Lumbermen Discuss Rates

### Pass Strong Resolution to Oppose Increase—Will Take Up Credit Bureau Question at Next Meeting

The Lumbermen's Section of the Toronto Board of Trade held an important meeting on March 26th, the discussion at which was chiefly in relation to the application of the railway companies for permission to increase their freight rates between points east of Port Arthur. The usual luncheon was held at 1 o'clock and at 1.30 Mr. J. L. Campbell, chairman, opened the meeting. A motion was presented in a letter by Mr. A. E. Clark, who was unable to be present, but who wished to have the section discuss the formation of a credit bureau. This motion was laid over until the next meeting on account of the importance of the freight rate question which had to be dealt with in detail so that the views of the Section might be presented before the Board of Railway Commissioners at their meeting in Toronto on March 29th.

Mr. J. L. Campbell, chairman of the special committee appointed at the previous meeting to consider the freight rate question, reported that the committee had had an interesting interview with Mr. Marshall, the traffic expert of the Board of Trade. Mr. Marshall had told them that the railways were all asking for the increase, not on account of hard times, or the war, or any falling off in business. They were simply stating that they needed the increased rates so as to raise money for carrying on their business this year, next year and for all time. Their purpose was to make this increase a permanent one, not one which would be subject to revision when circumstances should improve. The argument that they should bear their share of the burden of hard times did not apply to the case. They brushed this aside, simply saying that they wanted more money in the future. Mr. Marshall had prepared some pretty strong arguments and had put them before the commission, but the Commissioners seemed to be somewhat inclined to neglect these arguments.

Government reports showed that the C. P. R. had paid large dividends, had carried large amounts to reserves and did not require more money. The same thing applied to the Grand Trunk. Other railways had been paying dividends as high as ten and fifteen per cent. on the capitalization of the roads. But the railways declared that they must have more money. They claimed that it was not a question of comparison between their rates and those of any other roads. So far as Toronto was concerned it seemed that their case had been somewhat weakened by reason of the Board of Trade of Montreal agreeing to give the railways one-half of what they were asking for. This was practically admitting that the railway companies should have more money. There was a difference between the cases of Toronto and Montreal. In Montreal they would not feel the proposed increases so much as in Toronto as the rates to Toronto were higher. Toronto lumbermen should take steps, therefore, with Mr. Marshall's co-operation, to impress upon the Board of Railway Commissioners the fact that the lumber traffic to Toronto was carrying now all the expense that it could afford to carry and that the proposed increases would be an injustice.

Mr. Campbell reported that a proposed resolution had been prepared along these lines for the consideration of the Section.

A lengthy discussion followed regarding the best form in which to present this resolution. It was finally decided that the resolution should be brief and simply state the fact that the lumbermen of Toronto objected emphatically to the proposed increases. To supplement this, the committee should secure as definite facts and arguments as possible for Mr. Marshall to present to the Board. The resolution as carried was as follows:—"That the Lumbermen's Section of the Toronto Board of Trade now in session do unanimously and most emphatically protest against any further advance in freight rates on lumber products as proposed by the railway companies."

The committee upon this subject subsequently held a meeting and drew up a preamble to the resolution, which is published elsewhere in this issue as part of the report of the Toronto session of the Board of Railway Commissioners.

## New Brunswick to Survey Its Crown Lands

Reports have recently appeared in the press of New Brunswick to the effect that the Provincial Government intended to spend about $400,000 in making a survey of the Crown Lands of the province. The Canada Lumberman is advised by Hon. Geo. J. Clarke, Minister of Crown Lands for New Brunswick, that no specific amount has been determined upon for expenditure in connection with the proposed survey of the Crown lands of the province. It is desired to begin the work of survey and classification during the coming season, but no definite arrangements have yet been made. Hon. M. Clarke adds that at best, little more than preparatory work can be accomplished this year.

## Georgian Bay Association Formed

"The Georgian Bay Lumbermen's Association," is the name of the latest organization of lumbermen to be formed in Ontario. This association is the result of discussion and informal meetings which have taken place during the past winter. The first meeting was held at Sudbury, and subsequent meetings at Toronto. The objects of the association, as outlined in a letter sent out after the first meeting, are as follows:—

1st. To consider all subjects that are of mutual interest and have direct bearing on the conduct of woods work and saw mill operations.

2nd. To systematize and devise a working plan for the various problems that are of mutual interest, that will produce the best results, financially and otherwise, to all concerned.

3rd. To have such organization and under such control as may be decided upon.

Individual expressions of opinion were then secured as to the desirability of forming such an association. At the next meeting, which was held in Toronto, the following were present:—W. E. Bigwood, Jas. Playfair, Alfred Beck, Geo. Jackson, B. F. Cane, Mr. Eddy, Mr. McBride, Mr. Dougherty, Geo. R. Gray, J. R. Stover, W. J. Sheppard, J. Ludgate, Guy H. Moulthrop, E. B. Foss, J. O. Smith, W. J. Bell, J. J. McFadden, Mr. Bartram and F. N. Waldie.

Mr. W. E. Bigwood was appointed chairman of this meeting, and Mr. F. N. Waldie secretary. An interesting discussion followed upon various matters of interest to the lumbermen of the Georgian Bay. A committee was appointed to formulate ideas and, if possible, make arrangements for the benefit generally of operations. This committee consisted of Messrs. W. J. Sheppard, W. J. Bell, J. J. McFadden, J. Ludgate, W. E. Bigwood, F. N. Waldie, J. R. Stover, and G. R. Gray.

At a meeting of the committee it was decided that the Association should be called "The Georgian Bay Lumbermen's Association," and that a special committee should be appointed to secure the services of a secretary-treasurer and to devise means of working out and organizing the association. It was also decided that each party joining the association should be asked to contribute $10. The special committee subsequently secured the services of Mr. A. J. Jordan, as secretary. Mr. Jordan's address is Box 109, Sudbury, Ont.

Another meeting was held late in March at which there was a good attendance and the indications are that the association will at once take its place as an important factor in connection with the lumber manufacturing industry of the Georgian Bay district.

## Cooperage Trade Continues Quiet

There is very little change in the situation of the cooperage market at the present time. The export business is practically dead, as freight can not be secured, although the demand for export is pretty good. It is only a question of obtaining freight room to move a large quantity of stock.

The demand for the home market is below normal for this season of the year, and parties wanting stock for prompt shipment can buy it at very reasonable prices. For future shipment the manufacturers do not care to quote except at higher than the prevailing prices, as there is every prospect of better business in the near future.

Trade in Canada is also quiet for this season of the year, but there is a general firmer tone throughout the market, and as the mills have only put in very light stocks this winter, the manufacturers are retaining their prices firmly and not cutting to get business.

This is always a very light season for the Canadian trade. It is generally the latter part of April before cooperage stock begins to move freely. There is also considerable demand for export for Canadian goods, but only occasional shipments can be made for want of ocean freight room. We can not see any relief for the present for this situation.

## Canadian Shingle Exports Increasing

According to the United States Department of Commerce statistics 81,987,000 shingles were imported into the United States from Canada in January, 1915, having a valuation of $157,951. In January, 1914, the importation was only 42,706,000, with a valuation of $99,845. The same statistics show that for the seven months ending January the comparison is as follows: For the seven months ending January, 1913—390,960,000 pieces, valued at $964,778; in 1914 there were, both free and dutiable, 407,449,000 pieces, with a valuation of $1,008,346; and in 1915, 800,417,000 pieces, valued at $1,699,291. In January, 1915, Canada sent into the United States 33,430,000 feet of lumber, with a value of $637,744, as against 34,869,000 feet, valued at $687,963, for the same month in 1914. For the seven months ending in January, 1915, United States lumber imports from Canada reached a total of 558,217,000 feet, valued at $10,559,695. In the same months in 1914, there were 573,424,000 feet, valued at $10,792,341, and in 1913, 700,171,000 feet, valued at $12,138,958.

# Lumber Industry Discussed in Commons

## Sir Geo. E. Foster Announces Appointment of Commissioner to Visit Foreign Lumber Markets—The Pit Prop Trade Situation.

In the House of Commons, on April 3rd, a discussion upon Canada's Foreign Trade was brought up by the consideration of the estimates of the Department of Trade and Commerce. In reply to a question by Sir Wilfrid Laurier, Sir Geo. E. Foster, Minister of Trade and Commerce, made the following interesting statement:—

The lumber industry of the western part of Canada has been in rather a bad way, and it has not been helped very much by the war, which has disorganized freights and financial conditions. I think the lumber situation in Eastern Canada is looking up. Inquiries which are being received from France, Great Britain and Belgium, indicate a more satisfactory condition in respect of certain kinds of lumber produced in Canada. The condition of things in the West during the last year and a half or two years has contributed to a diminuation of building activities, and naturally this has had a very material effect upon a large number of the British Columbia mills. Boards of Trade and others have been in correspondence with me with reference to some special means by which they could be helped. Trade commissionrs in all countries were instructed to make special investigations in regard to markets for British Columbia lumber, and a very extensive and useful series of reports was sent in. Although this information has been useful, British Columbia felt that its case ought to be specially considered, and after mature consideration I acceded to that suggestion as being reasonable, under the circumstances. Accordingly, I appointed a special commissioner, who will take up his duties in a day or two. He will go from British Columbia to Japan, spending a little time there, and will then proceed to make investigations in China and India. China is now a large consumer of lumber, and when she begins to open up and develop her vast resources, lumber will form a most important item of import. What strikes one as he goes through China is the extreme bareness of the whole country. In years gone by, when the principles of consevation were not applied, the timber was stripped from the country, and to-day almost every hill in China is bare to the top. In the northern and far western portions of the country they have, of course, a considerable amount of timber, but for the most the greater part of that vast country, having done nothing in the way of afforestation or reforestation, must depend upon outside countries for its timber. From India, the commissioner will go to Australia and New Zealand; thence to South Africa or South America, I am not sure which; thence to Great Britain, where he will conclude his investigations. I asked the lumber and forests interests in British Columbia to recommend to me a proper man for this position, and they recommended a Mr. MacMillan, recently connected with the Forestry Department in British Columbia, who was born and educated in Ontario, and who has had a good deal of experience in this line.

Mr. J. H. Sinclair (Member for Guysborough, N.S.), who followed Sir Geo. Foster, said:—I wish to call the Minister's attention just for a moment to the difficulties of the Maritime Provinces in regard to freight. It is very difficult at the present time to get steamers to carry lumber. The most convenient class of vessels that we now have in Canada is the larger class of schooners, which are pretty well employed in the trade between Eastern Canada and British Columbia. At the present time there is quite a demand on the coast of Eastern Canada for British Columbia pine. In the town of New Glasgow, where I live, large quantities of it are used in the manufacture of cars for our railways; in fact, the specifications do not permit of any other kind of lumber being used for certain parts of the car. This lumber has to come by rail, and in many cases at very great expense. What I wish to point out to the Minister is that it could come for half the cost by water, provided that the vessels were permitted to carry it down the western coast of Canada and through the Panama Canal. But the great difficulty is that the coasting laws do not permit a captain holding a coasting license to go into those waters. The laws are now so restrictive that a captain with a coasting license cannot take a ship from an eastern port in Canada through the Panama Canal to British Columbia, or vice versa; and I suppose that nine-tenths of these large schooners that I have spoken of are manned by captains holding coasting, and not deep sea, licenses. If my Hon. friend had enough influence with the Minister of Marine and Fisheries to get him to remove this difficulty he could do a great deal towards promoting trade between British Columbia and Eastern Canada, and, I think, the eastern ports of the United States as well. That would be a great relief to the shipping people of the Maritime Provinces, who are hampered in their trade not only with the western coast of America, but with South America as well. We are not able to send our vessels down to the River Plate or to Rio or to any of those ports where there is now a profitable business. There is no reason in the world why they should not go there. I think it would be impossible for anyone to furnish a good reason why a captain holding a coasting license should not be allowed to go anywhere along that coast. Our captains traded there for a hundred years prior to these new restrictive laws being introduced, and they always succeeded in getting back and making profitable voyages. Our captains to-day are just as good men as they were, but owing to the legislation that has been passed here in regard to coasting voyages they are not able to take advantage of that trade.

### The Trade in Pit Props

There is another question to which I should like to draw the Minister's attention while I am on my feet. Last autumn, after the war broke out, there was considerable discussion in the papers in regard to the prospects of trade in pit props between the ports of Nova Scotia and Great Britain. It was pointed out that owing to the disturbance in Europe the Baltic trade had been cut out, and that the mine owners in Great Britain required large quantities of pit props, and that these might be supplied from Nova Scotia or some other of our Maritime Provinces. A good many people in the Maritime Provinces were interested in that proposal. I am told that my honorable friend has been making some inquiries in regard to it, and I am sure that any information he could give to the House and the public as to the prospects of developing a trade in pit props between our ports and Great Britain would be very interesting.

Sir George Foster replied as follows:—The matter was taken up by the Department of Trade and Commerce, and a deal of correspondence ensued. It became a matter of very great moment to the mine owners in Great Britain, and they had some conversations with the British Government in regard to it. The result of it all was that a Commission was appointed, consisting of representatives of the mine owners and a representative of the British Board of Trade. They came to Canada, and we placed at their disposal all the information and facilities we had. They visited different parts of Canada, taking in Quebec, New Brunswick and Nova Scotia. They also made a visit to Newfoundland. After they had gathered all their information they made a report which, in the main, followed along this line. The resources were ample in Newfoundland and in the portions of Canada that they visited. But some difficulties were apparent. One was the difficulty of freightage, which has been a difficulty in every line of enterprise. Another was that it was impossible for them to lay their hands upon any sufficient supply of pit props that we had ready for the market. They had then to face this condition; that if contracts were entered into the pit props would have to be cut in Canada during the months of the winter that has just passed, and brought out for spring and summer transport. Difficulties in two ways cropped up there. No one knew how long the war would last or how soon the Baltic supply would again be accessible—and pit props come from other European countries besides Russia. The trouble then was with making contracts for an indefinite period of time. No one here would like to contract unless he could contract for a year or two years' supply, and the mine owners in Britain did not want to make a contract for one or two years' supply because of the uncertainties of the situation. Some business has taken place; and I think some work has been done during the past winter, but on a somewhat limited scale. The commission also made inquiries in British Columbia, and I believe some business in pit props has resulted from that part of the country. The commission's report shows that the resources of Canada for the kind of timber have been examined into and found ample. I think that is the main information that I can give my honorable friend.

Mr. Sinclair asked: Is the Minister of the opinion that the trade could profitably be carried on in times of peace?

Sir George Foster replied:—That will depend. It is thought that the price of pit props will never again be as low as in the past, and if the price is permanently raised it may make business on this side possible. I have also heard that some of the mine owners are substituting metal props for timber, but that is just an experiment, and whether it can be done economically or not I do not know.

Mr. E. M. Macdonald (Pictou, N.S.), said:—In my county a large number of men are engaged in the coal industry. The difficulty in making contracts was that the gentlemen who came to conduct the business in Nova Scotia insisted that the inspection of the pit props should take place on delivery in England. This wood is in itself very valuable, and our men reasoned this way: Suppose we send a ship load of pit props which, after a rigid inspection, are condemned; it

would be impossible for us to sell that timber, as it is not used for other purposes, and the venture would be a total loss. From the way in which the business is carried on in connection with our mines, of necessity there must be quite a number of these pit props rejected from time to time by the local people. The consequence is that men in the business fear to engage in any kind of wholesale way in the delivery of these goods to England. If the parties who are interested in obtaining that trade could arrange for an inspection of timber on this side, I am quite sure that there would be a very much larger supply offered. The business of cutting pit props is not confined simply to the winter season in our province but goes on during all seasons of the year. When there is a good deal of snow it is easy to bring this small wood out on sleds, and the opportunity it therefore taken advantage of, but at the same time the work is going on throughout the year. Having some clients who are engaged in this business, I happen to know that this is their principal difficulty with regard to engaging in this business. If the question of inspection was solved there would be a great deal more of this class of timber offered.

Sir George Foster replied:—It would be quite possible to solve the question of inspection if other conditions could be made right. My own department would be quite willing to undertake to have the inspecting done on this side, and done under specifications as given on the other side, just as we have done in some other particulars. That could be facilitated if the other conditions could be made right.

Mr. Macdonald:—If there has been any slackness, that has been the cause of it. You can send deals, or any of the other qualities of lumber that have been going to England, and timber of that class that is found defective in some respects can be disposed of for other purposes, but that condition does not arise in regard to pit props.

## L. W. Halliday Married

L. W. Halliday.

Mr. L. W. Halliday, assistant to Mr. Andrew Rutherford, manager of the factory of William Rutherford and Sons Company, Limited, Montreal, was married on March 25 to Miss Mary H. Kearns, of Montreal, at St. Luke's Presbyterian Church, Montreal. After the wedding, which was of a quiet character, a dinner was held at the Place Viger Hotel. Mr. Halliday is an Englishman who has made good in the lumber and sash and door industries. He was born in Birmingham, and on coming to this country, nine years ago, obtained a minor position with the Rutherford Company. He is young and full of energy, and as the business expanded, improved his position with the largest combined business of wholesale and retail lumber, planing and saw mill, and interior finish in Eastern Canada. The factory end of the firm is an important one, and in these days of keen competition efficient management is more than ever essential to the economic working of the plant. The firm presented Mr. Halliday with a clock and the office staff gave him a dinner and tea service.

## Honored Their Retiring Associate

Mr. Daniel Patterson, who for many years has occupied the position of general superintendent of factories for the R. Laidlaw Lumber Company, Toronto, recently retired, and the members of the company and staff took advantage of the occasion to present him with a handsome 17 jewelled gold watch and a curb link chain. The presentation was made on March 29th, in the evening, at the company's west warehouse.

Mr. G. C. MacBeth made the presentation, and delivered a very happy speech, during which he recalled the time when Mr. Laidlaw, some fourteen years ago, decided that the firm ought to have a factory in connection with the lumber business which it had established. Mr. Laidlaw was looking at that time for a man to place in charge of the factory, and Mr. MacBeth had brought up the name of Mr. Patterson, knowing him to be a very capable man for such duties. Mr. Patterson was appointed to the position and had held it ever since, giving great satisfaction to all concerned. Not a little of the prosperity of the firm had been due to Mr. Patterson's energy and ability.

Mr. Patterson made a reply explaining his reasons for retiring. Some time ago he had been advised by his physician to take a rest. The opportunity to do so had not developed until the present. With the comparative quietness of business at present he had thought that he could drop out now with the minimum of inconvenience to the company. He thanked all his friends for their kindness, which he would remember with pride all his life. Mr. Patterson is retiring to a farm which he has bought near Bronte, Ont.

Mr. W. H. Shaw made a brief speech recalling a number of interesting and humorous incidents relating to Mr. Patterson's connection with the company. Mr. Walter C. Laidlaw, on behalf of the company, also made an appreciative speech.

## Personal Paragraphs

Harry G. Hayes, well known wholesaler of Vancouver, B.C., was recently in Seattle.

Mr. A. C. Manbert, of Graves, Bigwood and Company, Toronto, has returned from California, where he spent several of the winter months.

Mr. P. Bourdages, of St. Bonaventure, has been appointed by the Quebec Government as Crown Lands and Timber Agent for the Division of Bonaventure East.

E. J. Palmer, general manager of the Victoria Lumber & Manufacturing Company, Chemainus, B.C., recently visited a number of his Seattle and Tacoma friends.

J. G. Robson, president of the Timberland Lumber Company, and prominent in Hoo-Hoo circles in B. C., was unanimously elected president of the Board of Trade of New Westminster for the ensuing year.

Mr. Gustave Villeneuve, manager of the Eagle Lumber Company, Limited, Mont Laurier, P.Q., has been appointed Commissioner for the civil erection of parishes in the Roman Catholic diocese of Mont Laurier.

Recent visitors to Vancouver, B.C., included Chevalier Luigi Zuanelli, a paper manufacturer of Rome, who expressed the opinion that there should be a good market for British Columbia pulp and timber products in Italy.

Mr. John Graham, formerly of Earlton, N.S., has been appointed assistant manager of the North American Lumbering & Shipping Company, Limited, with headquarters at Nakomis, Sask. The company operates retail yards in a number of western towns.

Sir William Price, president of Price Brothers and Company, Limited, has resigned the position of chairman of the Quebec Harbour Commission. He finds it increasingly difficult to give the necessary time, owing to the pressure of his ordinary business engagements.

Guy E. Robinson, New York manager of sales, representing the Hawkesbury Lumber Company, Limited, Gillies Brothers, Limited, and the James MacLaren Company, Limited, has moved his office to the Aeolian Hall, 33 West Forty-Second Street, rooms 1838 and 1839, telephone Bryant 1258.

Captain J. B. White, 17th Hussars, manager of the woods and saw mills departments of the Riordon Pulp and Paper Company, and Adjutant C. E. Read, Jr., Army Service Corps, member of the firm of Read & White, Montreal, have volunteered for the front. Adjutant Read is a graduate of the Royal Military College, Kingston.

Mr. Duncan McLaren, Union Lumber Company, Toronto, returned recently from a two months' visit in the South. Mr. McLaren, who was in rather poor health, has returned fully restored. During his trip he was accompanied by his wife and family, and they visited, among other places, New York, Sea Breeze, Jacksonville, St. Augstine, Palm Beach, Miami and Cuba.

Mr. H. A. Ellis, manager of the Sherbrooke Lumber Company, Barachois, Gaspe, P.Q., returned with Mrs. Ellis and their son from a very enjoyable six weeks' trip in the south. Mr. Ellis visited the Panama Canal, going by way of Havana and returning by way of Key West. He also visited Palm Beach, St. Augustine, Jacksonville, Washington, New York and Boston.

H. M. Harrell, of the Harrell Lumber Company, Vancouver, recently visited Regina and other Saskatchewan points. Mr. Harrell's company ships extensively to prairie province consumers. He reports that Western Canadian farmers have been buying lumber extensively to provide increased stabling and other accommodation preparatory to sowing an increased acreage of grain this year.

Officers of the B. C. Lumber & Shingle Manufacturers, Limited, for the current year, were recently elected as follows:—President, L. A. Lewis, of the Brunette Sawmills, New Westminster; vice-president, J. W. Hackett, of Robertson & Hackett, Vancouver, and J. O. Cameron, of the Cameron Lumber Company, Victoria. Directors, J. D. McCormack, Canadian Western Lumber Company, New Westminster; J. Black, Hastings Shingle Manufacturing Company, Vancouver; J. Hanbury, Hanbury Lumber & Manufacturing Company, Chemainus; E. C. Knight, Vancouver Lumber Company, Vancouver.

# The Reader's Viewpoint on Trade Topics

## Canadian Spruce and Hemlock Safe Timbers for Construction Purposes—The Anti-Shingle Campaign

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—

### Use Canadian Timber and Be Safe

Editor Canada Lumberman: Cincinnati, O., April 6th.

I read with interest an item in your April 1st edition under the heading "Combating Dry Rot in Timbers."

There are so many varieties of yellow pine growing in the south that it is a very difficult matter for the average person to use any yellow pine without getting from one to several varieties that will rot quickly. Good longleaf yellow pine is very desirable for building purposes on account of its strength, but if the material is subject to dry rot, strength is only temporary, and sometimes in the space of a few months only, the material is rotten. There is only one variety of yellow pine that is reliable, and that is the longleaf variety, and even the sap of that timber is liable to rot if cut in the summer months and not properly cared for.

There have been quite a number of items in the lumber journals in regard to yellow pine, and specifications on it which would insure getting timber having strength and durability. Some have suggested specifying a certain number of growth rings to the inch, but that system has no merit. Two varieties of yellow pine contain a very large percentage of heart timber, and, consequently, only a small percentage of sap timber. All other varieties are very largely sap. These sap varieties are all right for making boxes, or for any other purpose where durability is not required. About the only way a person can be likely to get yellow pine that will have durability is to specify that no piece shall show less than eighty per cent. heart on the four sides. That means that no more than twenty per cent. of the outside of the piece shall show sap. Even under these specifications, a person will get some undesirable timber, so **the safest way for Canadians to do is to use their own timber, that is, spruce and** hemlock.—U. S. Wholesaler.

### The Campaign Against Shingles

Editor Canada Lumberman:— Vancouver, B.C.

Though it is a generally recognized axiom in business ethics that abusing a competitor does not pay, people may occasionally be found who will stoop to this obsolete method of advertising. We have before us an instance in the form of a pamphlet entitled "The Evil Shingle Roof," urging a campaign against the use of shingles on account of the danger from fire. An amusing instance of simplicity in this piece of advertising for what are called "fire-resisting roof coverings" is afforded in the paragraph therein which states that anyone maintaining that shingle roofs are not a menace, wherever used, has either no large stock of intelligence or is speaking for a private interest against a public good. The latter alternative is particularly funny in a pamphlet obviously got up to advocate so-called fire-proof roofing, and incidentally to defeat another industry which might easily flourish side by side with that of "fireproof" roofings. There can be no surer proof of failure than is evidenced by descending to abuse of a competitor.

We cheerfully admit that shingles burn when set on fire. We have seen a man recommend fireproof roofings that burnt with equal cheerfulness when a match was applied. These carefully engineered campaigns against the lumber business really owe their success, such as it is, to the apathy of the lumberman himself. He can see through their "fallacies" (to use the gentlest term one can), but he should recollect that such pamphlets as that referred to reach other people who have not the same means of detecting them. How many people, for instance, know that the figures of insurance companies show that wood is only .17 of one per cent. more hazardous than brick? That a wooden building properly protected with automatic sprinklers is insurable (in Seattle) for less than half the insurance rate on so-called fireproof buildings of concrete? In view of these and similar facts the shingle roof would hardly seem to merit the abuse lavished on it.

As a matter of fact, these efforts to undermine the shingle trade have been pushed with such energy as to defeat their own purpose. Had the perpetrators of such literature as "The Evil Shingle Roof" been content to state that it is highly desirable to restrict the use of shingles to certain types of buildings and certain districts they would not in the first place have roused the shingle manufacturer to show them up, as we believe they have at last done, nor would they have made themselves a laughing-stock to such of their readers as understand anything of building construction. The tenor of the pamphlet in question puts the shingle on the basis of rum in a prohibition state: namely, the very manufacture of the accursed thing must be illegal, for that would be the result of complying with the arrant nonsense expressed therein.

The shingle, like the navy bean, has been one of the greatest factors in American pioneering. They represent food and shelter in the most portable and efficient form. We do not recommend that a public banquet should consist entirely of beans nor that large public buildings should necessarily be all roofed with shingles. But to argue therefrom that all shingles should be taboo would be worse than folly; it would be catering to the evil-smelling, leaking compositions that sometimes do duty for roofs, or letting oneself in for the delights of a peaceful night under a covering of corrugated iron when a heavy rainstorm is in progress. We will respectfully call the attention of "fireproof" roofing boosters to the fact that roofs are not put up with the intention of taking fire, and that particularly careless people can have their shingles treated with an incombustible preparation. But as a matter of fact, these propagandists have not exhausted the list of the villanies of the shingle. It seems by the reports of a recent government enquiry that shingles make very ineffective soles for shoes. We present this suggestion to the author of the next article on the evil-minded shingle.—Mainland Lumber & Shingle Company.

### Can Turpentine be Profitably Abstracted from Logs?

Editor Canada Lumberman:— Brantford, Ont.

Do you know of any process or machinery for extracting turpentine from pine before the logs are put into the mill to be sawn into lumber? We have this enquiry from a British Possession and if we can give them any information about it we would like to do so.—Waterous Engine Works Company, Ltd.

There is at present no method or proposed process for extracting turpentine from pine logs before they are sawn into lumber. The Forestry Branch of the Department of the Interior advises us that in such a process steam distillation only could be employed, as this is the only method by which the gums and resins are extracted without destroying the wood fibre. Steam distillation is only practicable when the raw material is cut into comparatively small chips. This allows the steam to reach all parts of the wood at approximately the same time and the dissolving out of the resin is accomplished with the greatest economy of heat. If large pieces of wood were used it would be impossible to dissolve out all the resin, and as the resin contained in our native pines is small in any case such a method would be a practical impossibility.

### Inquiry for Birch Veneer

Attention may be called to Trade Inquiry No. 434, appearing in the weekly Trade and Commerce Report for April 5th, No. 584. This refers to a company manufacturing tea chests and other cases and who are experiencing difficulty in obtaining supplies of birch from Russia and other customary sources of supply. They are open to purchase large quantities from Canada if satisfactory arrangements can be made.

The birch veneer is required in thicknesses of 1/12, 1/20, 1/24 inch, 24 inches and upwards in width, and 54, 62 and 72 inches long. Quotations should be per 100,000 feet lots, face measure, prices c.i.f. London, exclusive of war risk. A sample, say, 12 by 10 inch of any thickness convenient is desired. It is stated that the present inquiry is merely in the light of a sample order and that large and regular quantities could be taken. Those interested should communicate with the Department, requesting the name and address of the firm referred to in Trade Inquiry No. 434.

A Vancouver report states that the schooner J. M. Weatherwax has been chartered to carry a cargo of British Columbia lumber to Australia for the Canadian Trading Company. This is the fourth cargo the company has sold recently. The lumber will be cut at Chemainus. The cargo and charter are the result of negotiations between Mr. Pettibone and the Australian Trade Commissioner representing New South Wales. The material is to be used for public works in New South Wales and should prove an advertisement for British Columbia timber. The Weatherwax has a carrying capacity of about 550,000 feet and is expected to be ready for loading about April 15.

# An Appeal to Pacific Coast Firms

**Yellow Piner Urges Fair Methods of Competition**

The opening of the Panama canal to traffic has given rise to widespread discussion among lumbermen in all parts of Canada and the United States as to the extent to which Pacific Coast lumber products will be enabled to compete in the east with the woods which have formerly held the market. There was an inclination at first to belittle the threatened invasion of west coast woods, on the ground that the cost of freight even by way of the Canal would be too heavy. In spite of the shortage of vessels and the high freight rates, however, conditions are shaping in such a way as to show that Pacific coast lumber products will soon play a very large part in the eastern trade. A significant evidence of this is the fact that eastern lumbermen are showing a far more definite concern over the importations from the west which are already coming to eastern markets. In the American Lumberman recently a yellow pine manufacturer appealed to the Pacific coast firms to avoid price cutting in the east. His letter reflects so forcibly the feeling of many lumbermen who have discussed the subject with the Canada Lumberman that we reproduce it in full, as follows:—

Douglas Fir Timber Millmen—

Gentlemen: When it became certain that the Panama Canal would be built and that Douglas fir could get around to the Gulf and Atlantic markets at a big saving in transportation cost over the transcontinental rail rates, we southern pine manufacturers were disturbed. We were making a little money then and beginning to realize on our investments, and we looked at the world of timber you have out there and your big mill capacity and your hankering after more trade, with a lot of concern. And when Colonel Goethals said that the canal would be opened by January 1, 1915, we not only hoped he was mistaken but some of us, though we are patriotic citizens, wouldn't have felt so badly if Gaillard had not been able to overcome the slides, or even if someone had blown up the locks—almost anything to avoid facing the competition which we did not like even to think about.

However, nothing much happened to delay the project, and we consoled ourselves that this game of lumber competition would be played according to the rules. We sort of figured that it would take more ships than you could get hold of or build to make a very big hole in the eastern markets for a good while. And that, anyhow, it would take some time to get the eastern buyers used to your product. They know about your long and big timbers, and you had sent some porch flooring and miscellaneous stuff across the country and a little around the Horn or across Tehuantepec. But the down-east part of the country after all did not know very much about fir, and it would take some time for them to get acquainted with it.

Then we figured that even with the low canal rates you would not be able to get into the eastern markets so awfully cheap after all. If your stumpage is worth anything, that ought to be taken into account, and our understanding was that your lumbering and manufacturing costs were higher than ours, so that even if you got a rate through the canal of $8 or $10 a thousand you were not going to have such an advantage over our stuff delivered by rail or coastwise after all.

Our ideas on those points seem to be working out pretty well, but you are not playing the game according to the rules.

Before I go any further along this line I want to say that I paid real money for my yellow pine stumpage. There are some people who are cutting lumber today that cost them originally about $1.25 an acre—fine 15,000-feet-to-the-acre stuff—and carrying costs during the last thirty years or so have not yet brought their investment to a big figure per thousand feet. But most of us are cutting timber that we bought at $2 to $5 a thousand anywhere from three to fifteen years ago, and if the cost of it doubles every eight or ten years you can see that we have something at stake. Then, I have a little nest egg, or rather a nest of eggs, in the shape of a few sections of Douglas fir timber, and I don't want those eggs addled or smashed before the time comes to put them into the incubator.

But it looks as though you were going to smash them, thrashing around as you are, and there is no consolation to me in knowing that you are smashing your own eggs as well. Of course, you have and had a big over capacity, and a fellow that has been foolish enough to build a sawmill in advance of a need for it is just as anvious to get his equity out as anyone is who has been wiser in his business policy. But that does not help the matter any.

One of the troubles with you was that practically all of you imagined that when the canal was opened you were going to put the billion or two billion feet of product that you might turn out with your surplus capacity into the eastern markets. You did not know how you were going to get it there, nor how you were going to distribute it or get the people to buy it when it was there.

It would seem that, instead of just hoping, you would have been getting ready for the canal during the two or three years before it opened.

But no! All you did was to dream dreams, and when the canal was opened and orders did not come in of their own accord and ships did not present themselves and get loaded automatically and stuff get distributed on the Atlantic coast also automatically and the settlements therefor fly in, you grabbed at anything in sight. You did not even try to play the game.

This lumber game, it seems to me, has some pretty well defined rules, if anyone is entitled to sit in it with gentlemen, or if one is not to be considered a mere tyro. A few times in my life I have seen people draw to a 3-card flush, but I never did see that draw win out. I have also seen players take a trick with an ace when a two-spot would have done as well; which is to say that a lumberman should not expect the impossible to happen, nor that he should sell lower than he has to to get the order.

All of us—you fellows on the Coast and we in the South—are supposed to be in business to make money. We won't admit that Douglas fir is any better than yellow pine, and, in fact, we think that on the whole yellow pine is the better wood, especially the genuine longleaf and shortleaf species. But we do admit that you have some advantages over us.

When it comes to cutting timbers that square up 12 inches or more and 50 feet or longer, we would rather not have the orders at any price we could get. You can furnish that sort of stuff and we will admit that Douglas fir is good structural material. Then if anybody wants planking or joists more than 14 or 16 inches wide, we can not afford to fill it at any price that we are likely to get. You are welcome to it. And then we suppose a certain amount of finish, stepping and sundries must be conceded to you for the sake of variety and good fellowship.

But why should you sell any of these things lower than you have to in order to get the business?

The other day I heard that a big bill was sold to be delivered in Buffalo at $22 per thousand for big timbers and heavy planks. Twenty-two dollars a thousand! I don't know how much it will cost to deliver that stuff at Buffalo by the cheapest route, which would probably be all water, at any rate water from Seattle, or wherever it is to come from, to New York. But suppose it cost $12. That would leave $10 for the stuff on the Coast and the profit, if there is any, in addition.

You were so anxious for the business; built such great hopes on it and were so disappointed when it did not come, that you grab at anything which presents itself, and are putting yourself soul and body, sawmill, stumpage, and all, into the hands of the scalpers.

In this case the scalpers seem to be vessel owners, who are really interested only in making their vessels pay. They don't care whether the lumber pays or not. They care nothing about stumpage values or your mill profits, and they don't know enough or care enough about the lumber business to work for fair prices if they did.

It is the old story of the scalper again.

That gentleman is not in favor down in my section of the country. If we can't get our profits through our own sales departments and our own representatives to the retail yards, or the wholesale consumers, we may sell outright to wholesalers. That is legitimate; for when the wholesaler has bought a carload or a million feet of lumber at our price, he has got to hold up the general market price in order to get his profit. We also may sell through commission men, at our figure but not at theirs. And we shift the cost of the selling burden on to them, and allow them 5 per cent. or $5 a car, or something of that sort, for doing that work.

I don't mean to say that we are all wise or financially sound, or that we all have good horse sense. But most of us turn cold shoulders to the fellow that goes out and gets an order at a low price and then comes around to us and wants to buy it at a lower price so that he can make his profit. Neither do we encourage people who want us to ship to their account to be sold in transit at whatever price they may name.

We don't like to have our markets that we have done business in for many years invaded by this new and cheaper wood, but we have got to stand it, to the extent that you are able to get in. All that we ask is that you play the game according to the rules.

Don't cut under us $6 a thousand, spoiling your own market and ours, when you could cut our price $1 and get the business.

But for Heaven's sake don't through this lumber-scalper-ship-owner scheme spoil our market now and your own for the future. If you have not got money enough to open yards in the East and buy boats to carry the stuff to those yards, sell you stuff to eastern wholesalers, who have the yards and who will put their own money into the game. Sell it to men who are lumbermen.

Keep your product in the legitimate trade channels. If you can get into the East at all with any profit or without loss, it will be in that way, and our loss will be as small as such legitimate competition will require.—Yellow Piner.

# Electricity in the Lumber Industry

## An Account of the Rapid Development of Electric Drive to Logging and Manufacturing Operations—Typical Installations Described

By E. F. Whitney*

A small saw ordinarly known as a "rock" or "barking" saw, to remove gravel, barnacles or other foreign matter from the bark of the log, usually precedes the main saw in the line of cut. It operates continuously, and requires a 15-h.p. motor; its load factor is approximately 30 per cent. A tin housing, piped to an exhaust fan, allows the dust to be carried away. This fan requires 15 h.p. and runs continuously at constant speed, with a load factor of approximately one hundred per cent.

The essential duty of the head saw is to cut timber of a certain thickness from the log. Refinements of this process—i.e., reducing these timbers to boards—really fall to other machines, viz., re-saws and gang saws, because of operating requirements. The single-cutting band mill is by far the most popular type of head saw; double-cutting mills are in general use when handling smaller timbers than are common in the Pacific Coast country, but circular head saws are by no means obsolete.

Driving the single-cutting head mill is a 300-h.p. constant-speed motor with wound rotor, and provided with drum controller and resistence for starting duty only. The large inertia of the heavy saw tension and driving wheels imposes severe starting conditions, but once up to speed, helps greatly in equalizing the load, so that in running we seldom encounter very high peak demands. The following data are typical of a mill of this capacity:

| | |
|---|---|
| Speed of saw wheels | 300 rev. per min. |
| Running demand range | 230 to 450 kw. input. |
| Starting demand | 560 kw. input. |
| Duration of starting demand | 38 seconds. |
| Running light, input | 60 to 70 kw. |
| Average kw-hr. per day of 10 hr. | 1050 |
| Load Factor—average | 22 per cent. |

Because of the slow speed of large band mills the motor is usually belted and a belt tightener used. See Fig. 8. Three-bearing motors are universal practise.

The polar-wound rotor type for constant speed service is commonly used, to limit the current input at starting. Where ample station capacity is available a squirrel cage motor can be used with impunity, now that the electrically-welded rotor end-ring construction has so greatly increased its ability to withstand long-sustained starting periods without damage. The simplicity and strength of a squirrel cage type motor makes its use very desirable.

With double-cutting mills the load factor and daily kilowatt-hour consumption are higher than the values given above. The power per thousand feet, however, is lower, due to the greater proportion of working to idle periods.

### Circular Head Saws

Squirrel cage motors are universally used for circular head saws. The inertia of the circular saws is low and the load fluctuations during the cut must be taken care of entirely by the motor. Fig. 9 shows a motor driving a double circular 66-in. (1 68-m.) saw. Where the saw speed permits, the best practise is to connect the motor directly to the lower saw arbor, driving the top saw with a belt. The following operating data are typical of a large double circular head saw:

| | |
|---|---|
| Running demand range | 240 kw. to 560 kw. input. |
| Starting demand | 360 kw. input. |
| Duration of starting period | 15 seconds. |
| Running light | 35 kw. |
| Average kw-hr. per day of 10 hrs. | 1150 |
| Load factor, average | 20 per cent. |

From the head saw, the boards or cants are conveyed by rolls and transfer chains which distribute the product to the other machines. The rolls directly in front of the head saw run at speeds of about 350 ft. (106.7 m.) per minute, the speeds in later sections decreasing slightly.

Present practise leans toward grouping two sections of roll with one or more sets of transfer chain, driving the group from a countershaft operating at 900 rev. per min., and driven by a direct-connected, constant-speed, squirrel cage motor. All rolls must be arranged for both forward and reverse operation, and the simplest scheme for accomplishing this and at the same time relieving the motor of all starting demands, requires the use of friction devices.

With individual motor drive, a back-geared reversing motor with chain drive from the back-geared shaft provides the most compact arrangement. Such a motor should preferably be of the polar-wound rotor type. Fig. 10 shows a general scheme using group drives.

Live rolls 12 in. (30.48 cm.) diameter by 30 in. (76.2 cm.) long require approximately 0.4 h.p. per roll when operating at 200 rev. per min. When operating at 100 rev. per min. they require approximately ¼ h.p. per roll. As a typical group, a section containing eighteen 12-in. by 30-in. (30.48 by 76.2-cm.) rolls at 120 rev. per min. and thirteen 12-in. by 30-in. (30.48 by 76.2-cm.) rolls at 80 rev. per min., three slab transfer chains, and three edger transfer chains, requires seven kw. input.

As an example of individual motor drive, with back-geared motor and chain drive to one roll case containing fifteen 12-in. by 32-in. (30.48 by 76.2-cm.) rolls driven from a line shaft by bevel gearing, the maximum running load is 4.8 kw. and the average running load is 3.7 kw. This information applies to cases where rolls are well lubricated and gearing in first-class shape. No average conditions can apply generally, since by far the greater part of the load is due to friction.

### The Edger

An edger consists of a number of circular rip saws, with the position of each adjustable on an arbor, the total width of stock determining the number of saws working at any one time and their position. Edgers adapt themselves admirably to direct connection; their speed is high and saw sizes can be so chosen as nicely to fit a

1200- or 1800-rev. per min. motor, which speeds are suitable for direct connection.

The starting load is comparatively light; the running load fluctuates through wide ranges and the saw speed should be practically constant, which conditions have caused the squirrel cage, constant-speed induction motor to be universally adopted. The feed rolls should be reversible, and capable of having their speed adjusted (see Fig. 11), the rate of feed depending upon the stock and carying from 325 ft. (99.1 m.) per minute to 120 ft. (36.6 m.) per min. For driving these rolls the latest practise has adopted a varying-speed, constant duty, reversing motor with polar-wound rotor.

On the edger arbor are mounted from five to seven saws running at rim speeds of 9,000 to 12,000 ft. per minute. The following is typical of the demands of a Pacific Coast edger 12 in. by 72 in., eight saws direct-connected to a 200-h.p. 1200 rev. per min. squirrel cage type motor:

| | |
|---|---|
| Input—Idle | 35 kw. |
| —5 saws cutting 6 in. stock at 220 ft. per min. | 350 kw. |
| —5 saws cutting 6 in. stock at 135 ft. per min. | 247 kw. |
| —3 saws cutting 10 in. stock at 135 ft. per min. | 290 kw. |
| —4 saws cutting 2 in. stock at 230 ft. per min. | 75 kw. |
| —6 saws cutting 1½ in. stock at 240 ft. per min | 75 kw. |
| Average per 10 hr. day | 405 kw-hr. |
| Average load factor | 11.6 per cent. |

### The Trimmer

This appliance consists of a gang of circular saws arranged in a horizontal line and spaced two feet apart, the total length varying from 40 to 50 ft. (12.2 to 15.25 m.). See Fig. 13. There are rarely more than four or five saws working at any one time and the load demand lasts only for an instant, so that by far the greater part of saws is of course constant, and operating constantly the load factor is 60 to 70 per cent. The saws are belted to a main drive shaft which in turn is driven by a direct-connected, constant-speed, squirrel cage motor. For average conditions, 50 h.p. suffices. The following observations give the operating requirements, including transfer mechanism:

| | |
|---|---|
| Running demand range when cutting | 47 to 80 kw. |
| Starting demand | 70 kw. input. |
| Duration of starting | 18 seconds |
| Running light, input | 29 kw. |

## Annual Meeting of Pacific Coast Loggers

At the annual meeting of the Pacific Coast Loggers' Association, held recently at Portland, Ore., George Johnson, of Seattle, was elected president, with J. G. Benthey as vice-president of the British Columbia district; A. W. Callow, vice-president of the Grays Harbor district; Ed. English, vice-president for the north section of the Puget Sound district; Mark Reed, vice-president for the south section of the Puget Sound district; J. S. O'Gorman, vice-president for the Columbia River or Oregon district, and E. J. Grammer, of Seattle, secretary. E. P. Blake, of Seattle, was elected treasurer. The next monthly meeting will be held at Vancouver, B.C., May 1. Conditions of the logging industry throughout the Pacific Northwest were discussed at the annual meeting and the general expression was that under prevailing prices it is more a question of seeing how little money can be lost than how large is the profit. For this reason operations are light and will continue so until a marked change is noted. It was evident that the stock of logs in the market is not large.

As an illustration of the effect the war is having on cargo rates, the case of the schooner William T. Lewis, being loaded with 2,000,000 ft. of lumber at Everett, Wash., is cited. The vessel is to get $50,000 for carrying its cargo to England, although the cargo is valued at but $25,000. Recently the vessel was changed to American register.

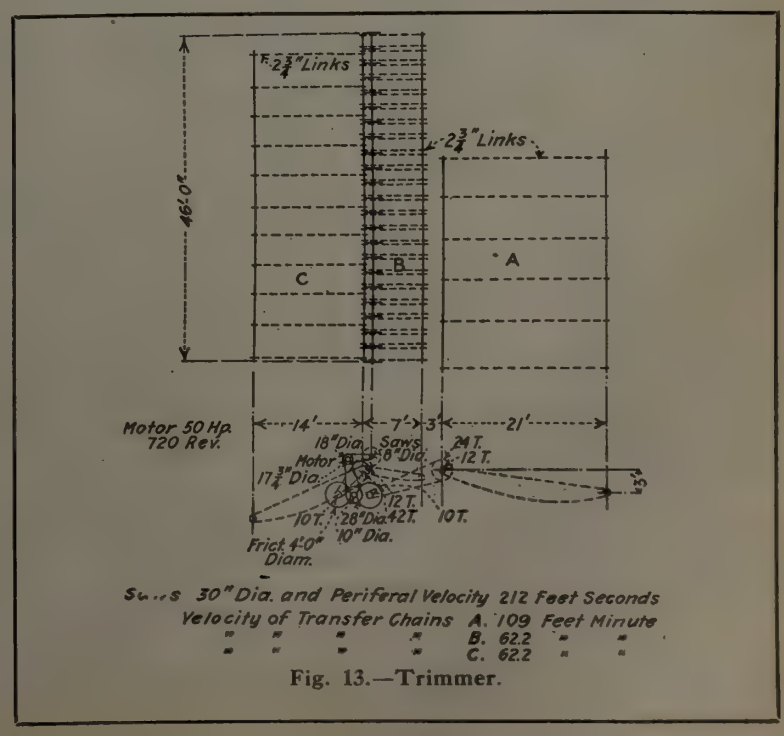

**Fig. 13.—Trimmer.**

# The Lumber Production of Canada

## Statistics of Output in Lumber Lath and Shingles—Comparisons of Quantity and Value for Two Years

A bulletin giving statistics of the production of lumber, lath and shingles by 2,187 mills operating in Canada during the calendar year 1913, has been issued by the Forestry Branch of the Department of the Interior. The figures for 1912, which were gathered from 2,558 mills, are included for comparison. The total value of the lumber, lath and shingles produced in Canada in 1913 was $70,644,362, the separate items being:—lumber, 3,816,642,000 feet, board measure, valued at $65,796,438; lath, 739,678,000, valued at $1,783,283, and shingles, 1,485,279,000, valued at $3,064,641.

Details of the production of sawn lumber in Canada in 1912 and 1913 by provinces are shown in Table 1.

The total production of lumber in Canada in 1913 decreased 13.1 per cent. from that of 1912. The 1912 production decreased 10.7 per cent. from that of 1911. It would seem as if the climax has been passed and that the production is now declining at about the same rate as it increased up to 1911. The cut of lumber in 1911 was 4,918,202,000 feet, board measure, valued at $69,475,784.

The climax of production in the United States was reached in 1909 when 48,112 mills cut 44,509,761,000 feet of lumber or over nine times as much as was produced in Canada in the climax year of 1911.

The cut in Ontario during 1913 decreased by 20.5 per cent., while that of British Columbia decreased only 10.7 per cent. This resulted in a change of relative position, which puts British Columbia at the head of the provinces in the production of lumber, Ontario, which has headed the list in the past, falling back to second place. An increase in production in Manitoba of 82 per cent. brings this province up to seventh place and drops Alberta to eighth place.

Reductions in the cut of lumber are to be noted in every province except Manitoba, the greatest proportional reduction taking place in Saskatchewan.

The average price of lumber at the mill throughout Canada increased by $1.41, increasing in British Columbia, Ontario, Quebec, New Brunswick and Saskatchewan and decreasing in Nova Scotia, Manitoba, Alberta and Prince Edward Island. The greatest increase in price ($4.08) took place in Ontario.

Table 1.—Total Lumber Cut, 1913, by Provinces

| Province | Rank | | Number of Firms Reporting | | Quantity | |
|---|---|---|---|---|---|---|
| | 1912 | 1913 | 1912 | 1913 | 1912 M. Ft. B.M. | 1913 M. Ft. B.M. |

| Alberta | 608,902 | 6.4† | 1.1 | 1.2 | 15.71 | 13.69 |
| Prince Edward Island | 85,120 | 5.6† | 0.2 | 0.2 | 13.78 | 13.32 |

†Decrease from 1912 to 1913.

Canadian sawmills in 1913 reported sawing twenty-seven different kinds of lumber. While spruce still formed about a third of the total production, some important changes have taken place in the relative order of the other different kinds of wood cut. The cut of white pine decreased by over a quarter, while that of Douglas fir decreased by only 10.9 per cent. Douglas fir consequently moved up to second place on the list.

The cut of red pine increased by 1.4 per cent., while that of cedar decreased by 35.2 per cent., so red pine advances from sixth to fifth place. Among the ten most important woods the greatest decrease occurred in the case of cedar and the greatest increase in the case of tamarack. Among the hardwoods the changes in relative position are more frequent, as these woods, with a few exceptions, are cut from isolated stands and lands that have been lumbered over for pine, spruce and hemlock in the past. The supply of such woods is very variable from year to year.

### Hardwood Production by Provinces

Table 2.—Hardwoods—Quantity and Percentage of the Total Lumber Production in Canada and in Each Province

| Province | Quantity M Ft. B.M. | Per cent of Total |
|---|---|---|
| **Canada** | **263,613** | **6.9** |
| British Columbia | 2,469 | 0.2 |
| Ontario | 162,261 | 14.7 |
| Quebec | 67,601 | 10.7 |
| New Brunswick | 9,269 | 2.3 |
| Nova Scotia | 18,607 | 6.8 |
| Saskatchewan | 31 | * |
| Manitoba | 2,388 | 3.3 |
| Alberta | 154 | 0.3 |
| Prince Edward Island | 8.3 | 13.0 |

*Less than one-tenth of one per cent.

Ontario was the greatest hardwood-producing province, while British Columbia ranked next to last on the list in this respect. The hardwoods formed a higher proportion of the total production of lumber in Ontario than they did in any other province.

### Hardwood Production by Species

Table 3.—Hardwoods—Comparison of Quantities of each Produced in Canada in 1913 and Percentage of the Total Production

| Kind of Wood | Quantity | Per cent of Total |
|---|---|---|
| **Total** | **263,613** | **100.0** |
| Birch | 79,359 | 30.1 |
| Maple | 73,580 | 27.9 |
| Basswood | 36,009 | 13.7 |
| Elm | 30,766 | 11.6 |
| Beech | 12,983 | 4.9 |
| Poplar | 11,136 | 4.2 |
| Ash | 10,509 | 4.0 |
| Oak | 6,348 | 2.4 |
| Chestnut | 1,317 | 0.5 |
| All others | 1,606 | 0.6 |

The seven most important kinds of lumber in Canada in 1913 were softwoods. Among the thirteen most important woods only three were hardwoods. Birch, maple, basswood and elm in the order named are the most important, and these together made up 83.5 per cent. of the total production of hardwoods.

### British Columbia Production

Table 4.—British Columbia Lumber, 1912 and 1913, by Kinds of Wood

| Kind of Wood | Quantity 1912 M. Ft. B.M. | Quantity 1913 M. Ft. B.M. | Total Value 1913 $ | Average Value per M Ft. B.M. 1912 $ c. | Average Value per M Ft. B.M. 1913 $ c. |
|---|---|---|---|---|---|
| **Total** | **1,313,782** | **1,173,647** | **16,428,218** | **13.50** | **14.00** |
| Douglas Fir | 889,646 | 792,852 | 10,895,007 | 12.33 | 13.73 |
| Tamarack | 63,059 | 86,062 | 1,182,014 | 15.16 | 13.62 |
| Cedar | 125,042 | 82,627 | 1,210,276 | 18.61 | 14.65 |
| Spruce | 99,057 | 62,302 | 960,934 | 14.54 | 15.42 |
| Yellow Pine | 53,960 | 58,939 | 874,014 | 16.30 | 14.83 |
| Hemlock | 49,716 | 39,052 | 549,062 | 13.80 | 14.06 |
| White Pine | 15,543 | 29,783 | 429,224 | 13.54 | 14.41 |
| Balsam Fir | 13,742 | 15,255 | 227,012 | 15.17 | 14.88 |
| Jack Pine | 3,367 | 4,306 | 61,522 | 14.94 | 14.29 |
| Poplar (Cottonwood) | 646 | 2,381 | 38,069 | 19.85 | 15.99 |
| Birch | 1 | 62 | 804 | 12.00 | 12.97 |
| Maple | 3 | 26 | 280 | 20.00 | 10.77 |

The largest mills in Canada are located in British Columbia, where the average mill-cut was 7,381,428 feet, board measure, in 1913.

The only important change in the relative order of the species was in the case of tamarack. The production of this wood increased by 36.5 per cent. from 1912 to 1913, bringing this wood up from fourth to second place on the list. Douglas fir still formed over two-thirds of the production. The production of cedar lumber showed a great decrease.

The most expensive softwood in British Columbia is spruce, at an average value of $15.42. Of the entire production, 97.3 per cent. was made up of coniferous woods, or softwoods.

### Ontario Production

Table 5.—Ontario Lumber, 1912 and 1913, by Kinds of Wood

| Kind of Wood | Quantity 1912 M. Ft. B.M. | Quantity 1913 M. Ft. B.M. | Total Value 1913 $ | Average Value per M Ft. B.M. 1912 $ c. | Average Value per M Ft. B.M. 1913 $ c. |
|---|---|---|---|---|---|
| **Total** | **1,385,186** | **1,101,066** | **25,772,617** | **19.33** | **23.41** |
| White Pine | 754,892 | 516,098 | 1,539,269 | 21.26 | 29.83 |
| Hemlock | 162,005 | 142,731 | 2,394,986 | 13.89 | 16.78 |
| Red Pine | 128,431 | 132,646 | 2,461,800 | 18.28 | 18.56 |
| Spruce | 110,626 | 104,485 | 1,597,652 | 16.46 | 15.29 |
| Maple | 62,754 | 61,213 | 1,107,384 | 20.03 | 18.09 |
| Elm | 29,178 | 27,305 | 593,853 | 29.98 | 21.75 |
| Birch | 28,336 | 25,665 | 512,005 | 19.23 | 19.95 |
| Jack Pine | 22,119 | 24,297 | 352,510 | 14.59 | 14.51 |
| Basswood | 34,794 | 22,867 | 501,959 | 16.81 | 21.95 |
| Cedar | 13,791 | 9,493 | 151,484 | 16.20 | 15.96 |
| Beech | 10,151 | 8,701 | 145,464 | 16.41 | 16.72 |
| Ash | 6,542 | 5,677 | 142,698 | 22.52 | 25.14 |

| | | | | | |
|---|---|---|---|---|---|
| Oak | 5,575 | 5,081 | 171,334 | 30.73 | 33.72 |
| Balsam Fir | 4,644 | 4,364 | 69,478 | 18.39 | 15.92 |
| Tamarack | 5,940 | 4.691 | 66,324 | 15.03 | 14.14 |

Other species cut in small quantities were poplar, chestnut, hickory, butternut, cherry, black gum, walnut, tulip, sycamore, sassafras, willow and ironwood.

The average mill-cut in Ontario in 1913 was 1,607,396 feet as compared to 1,708,000 feet in 1912.

The first fifteen woods on the list retained their relative positions, with two exceptions. The production of basswood in Ontario in 1913 was a reduction of over a third from the cut in 1912, and this wood dropped from sixth to ninth place on the list. A reduction of over a fifth in the cut of tamarack in the province caused this wood to drop down from thirteenth to fifteenth place. The only increases to be noted are in the case of red pine, jack pine and the poplar group (aspen and balsam poplar and cottonwood).

The average prices reported increased, on the average, by $4.08, the greatest increase among the more important woods being in the price of white pine, and amounting to $8.57.

Ontario cuts a greater variety of woods than any other province. Counting the poplar group (aspen and balsam poplar and cottonwood) as one kind, a total of twenty-five kinds were reported. Douglas fir and yellow pine are the only Canadian woods not produced in this province.

### Quebec Production

Table 6.—Quebec Lumber, 1912 and 1913, by Kinds of Wood

| Kind of Wood | Quantity | | Total Value | Average Value per M Ft. B.M. | |
|---|---|---|---|---|---|
| | 1912 | 1913 | 1913 | 1912 | 1913 |
| | M. Ft. B.M. | M. Ft. B.M. | $ | $ c. | $ c. |
| **Total** | **677,215** | **630,946** | **10,618,528** | **15.79** | **16.85** |
| Spruce | 353,066 | 316,703 | 4,618,212 | 13.35 | 14.58 |
| White Pine | 85,204 | 72,140 | 1,649,202 | 22.85 | 22.86 |
| Hemlock | 42,534 | 38,491 | 543,514 | 13.01 | 14.12 |
| Birch | 50,017 | 34,124 | 645,204 | 16.25 | 18.91 |
| Balsam Fir | 24,873 | 20,746 | 304,920 | 14.50 | 14.70 |
| Basswood | 18,091 | 13,121 | 271,077 | 19.44 | 20.66 |
| Red Pine | 11,045 | 9,750 | 197,271 | 17.55 | 20.23 |
| Maple | 9,856 | 7,364 | 129,049 | 15.43 | 17.52 |
| Cedar | 12,048 | 6,727 | 105,433 | 13.61 | 15.67 |
| Ash | 5,602 | 4,756 | 89,603 | 18.77 | 18.84 |

Other species cut in small quantities were elm, poplar, beech, tamarack, jack pine, oak butternut, poplar, cherry, hickory, chestnut and walnut.

While the number of mills in Quebec and the number in Ontario is almost the same, the average production of mills in Quebec is only 921,558 feet, as compared to 1,607,396 feet in Ontario. The larger number of small neighborhood or custom mills in Quebec cutting wood for the farmers accounts for this difference.

While a small increase was reported in the cut of the most important wood, spruce, the next ten most important woods decreased in production from 1912 to 1913. Decreases in the cut of birch and cedar caused changes in the order of importance of the first ten woods on the list, birch dropping from third to fourth place and cedar from seventh to ninth. The hardwoods in this province form 10.8 per cent. of the total production of lumber. The average price at the mill was $1.06 more than in 1912. The first fifteen woods all showed increases in price, the greatest of which was $2.73 in the case of red pine.

### New Brunswick Production

Table 7.—New Brunswick Lumber, 1912 and 1913 by Kinds of Wood

| Kind of Wood | Quantity | | Total Value | Average Value per M Ft. B.M. | |
|---|---|---|---|---|---|
| | 1912 | 1913 | 1913 | 1912 | 1913 |
| | M. Ft. B.M. | M. Ft. B.M. | $ | $ c. | $ c. |
| **Total** | **449,738** | **399,247** | **5,758,849** | **13.44** | **14.42** |
| Spruce | 406,615 | 412,259 | 6,498,301 | 14.42 | 15.76 |
| White Pine | 28,290 | 31,287 | 545,847 | 16.68 | 17.45 |
| Hemlock | 20,936 | 21,952 | 271,736 | 11.72 | 12.38 |
| Balsam Fir | 28,670 | 17,311 | 162,160 | 11.88 | 9.37 |
| Birch | 7,873 | 5,749 | 84,622 | 13.42 | 14.72 |
| Cedar | 5,100 | 2,154 | 19,802 | 17.59 | 9.19 |
| Maple | 2,164 | 1,945 | 27,770 | 14.47 | 14.28 |
| Beech | 1,011 | 838 | 11,850 | 12.96 | 14.14 |
| Poplar (Aspen) | 567 | 641 | 6,731 | 12.43 | 10.50 |
| Jack Pine | 708 | 358 | 4,882 | 11.19 | 13.64 |
| Red Pine | 802 | 201 | 2,959 | 13.17 | 14.72 |

Other species cut in small quantities were ash, basswood, poplar, tamarack, butternut, oak and elm.

While only 177 mills reported from New Brunswick in 1913 these mills cut a high average quantity, namely, 2,255,633 feet of lumber. This is the highest average mill production in Eastern Canada.

The cut of white pine increased by 10.6 per cent. and that of hemlock by 4.9 per cent., while that of balsam fir decreased by 39.6 per cent. This resulted in balsam fir dropping from second to fourth place on the list. Otherwise the relative order of the first eight woods remained the same as in 1912. The greatest decrease among the more important woods was in the production of cedar, and amounted to 57.8 per cent. The hardwoods formed only 2.4 per cent. of the production. The average price of lumber increased by $0.98 in this province in 1913.

### Nova Scotia Production

Table 8.—Nova Scotia Lumber, 1912 and 1913, by Kinds of Wood

| Kind of Wood | Quantity | | Total Value | Average Value per M Ft. B.M. | |
|---|---|---|---|---|---|
| | 1912 | 1913 | 1913 | 1912 | 1913 |
| | M. Ft. B.M. | M. Ft. B.M. | $ | $ c. | $ c. |
| **Total** | **312,763** | **274,722** | **3,669,264** | **13.77** | **13.36** |
| Spruce | 200,426 | 156,311 | 2,108,770 | 13.89 | 13.49 |
| Hemlock | 57,755 | 63,851 | 742,627 | 12.90 | 11.63 |
| White Pine | 27,370 | 28,918 | 478,540 | 15.94 | 16.55 |
| Birch | 13,438 | 13,095 | 171,317 | 12.48 | 13.08 |
| Balsam Fir | 5,469 | 5,251 | 59,165 | 10.95 | 11.27 |
| Maple | 3,054 | 2,946 | 37,404 | 10.43 | 12.70 |
| Beech | 1,878 | 1,770 | 23,643 | 11.08 | 13.36 |
| Red Pine | 2,003 | 1,657 | 24,490 | 15.72 | 14.78 |
| Oak | 658 | 614 | 18,938 | 26.77 | 30.84 |
| Poplar (Aspen) | 171 | 95 | 1,038 | 11.54 | 10.93 |

Other species cut in small quantities were jack pine, cedar, ash, poplar, tamarack, willow and elm.

With the exception of Prince Edward Island the mills in Nova Scotia cut a lower average per mill than those of any other province. This average in 1913 was 853,174 feet. Custom mills and small portable mills cutting out small stands of scattered timber are very numerous in this province.

Although the production of white pine and hemlock increased from 1912 to 1913, while that of all other woods decreased, the relative positions of the six most important woods remained the same as in 1912.

The average price of lumber decreased in this province, although the decrease amounted to only 41 cents. The price of spruce and hemlock, which form over 80 per cent. of the production, decreased, while that of the majority of the remaining woods increased. The hardwoods in Nova Scotia formed 6.9 per cent. of the total production of lumber in the province in 1913.

### Prairie Province Production

The three prairie provinces, Manitoba, Saskatchewan and Alberta, are chiefly engaged in the manufacture of spruce lumber. The few other kinds reported are relatively unimportant. The average mill-cut in Saskatchewan was 4,592,000 feet, coming second only to British Columbia in this respect. The four kinds of lumber reported were produced in about the same relative proportions in 1913 as in 1912. The only increase shown was in the production of tamarack. The average price increased by 50 cents, the only decrease being in the price of tamarack. Aspen poplar, the only hardwood cut in the province, formed less than a tenth of one per cent. of the total. The total production of Saskatchewan was 114,800,000 feet in 1913, and 157,255,000 in 1912.

Manitoba was the only province in Canada reporting an increase in lumber production in 1913. The mills cut, on an average, 1,439,220 feet each. The cut of every kind of wood but cedar increased, the greatest increase being with jack pine. The total production of Manitoba was 71,961,000 ft. in 1913 and 39,535,000 ft. in 1912.

Alberta's forty active mills cut an average of 1,111,550 feet of lumber each in 1913. Douglas fir, which is cut by only two mills on the east slope of the Rocky Mountains, showed an increase, while the other woods on the list were produced in smaller quantities than in 1912. The total cut of Alberta was 44,462,000 ft. in 1913, and 47,478,000 ft. in 1912.

### Prince Edward Island Production

The smallest province in Canada has also the smallest average mill-production of 142,022 feet. The timber in Prince Edward Island occurs only in small isolated stands, many of which are merely farmer's woodlots. This material is sawn almost entirely by small neighborhood or custom mills. The hardwoods in this province formed 13.1 per cent. of the total in 1913; this province is exceeded only by Ontario in this respect. The total cut of Prince Edward Island was 6,391,000 ft. in 1913 and 6,771,000 feet in 1912.

### Lath Production

The decrease in lath production in Canada from 1912 to 1913 was 17.7 per cent. as compared to 6.9 per cent. from 1911 to 1912.

Saw mills in Ontario are able to employ a closer utilization of their material than those in British Columbia, and consequently produce more lath, although the British Columbia mills produced more lumber in 1913.

The total production of laths in Canada was 739,678,000 pieces in 1913 and 899,016,000 pieces in 1912. The value of the 1913 production was $1,783,283. The average price per thousand was $2.41 in 1913 and $2.30 in 1912.

### Shingle Production

The decrease in the shingle cut in Canada from 1912 to 1913 was 5.9 per cent. as compared to 14.1 per cent. from 1911 to 1912. The

cut decreased in British Columbia, Ontario, Nova Scotia, and Prince Edward Island, increasing in Quebec, New Brunswick and Manitoba. Alberta did not report any production in 1913, but Saskatchewan reported a small quantity.

British Columbia produces more shingles than any other province, and in 1913 all these were made from one species, western red cedar (Thuja plicata). In Quebec over ninety-seven per cent. of the shingles were made of eastern white cedar (Thuja occidentalis). Other less important shingle woods in Quebec were spruce, white pine, balsam fir, jack pine, hemlock and aspen poplar, named in their order of importance.

In New Brunswick, cedar formed ninety-eight per cent. of the total, the remainder being made up of spruce, balsam fir, hemlock, white pine, red pine and aspen poplar.

Ontario manufactures a large proportion of her shingles from white pine, although cedar headed the list in this province in 1913. Shingles were also made in Ontario of hemlock, red pine, spruce, poplar, balsam fir, butternut and jack pine.

In the three Prairie Provinces, as well as in Nova Scotia and Prince Edward Island, where cedar is practically unknown, the shingles were made for the most part of spruce, with smaller quantities of balsam fir, and jack pine in the west and cedar, balsam fir, hemlock, white pine, jack pine, aspen, and birch in the two maritime provinces mentioned.

With cedar forming 93.7 per cent. of the total production of shingles in Canada the other woods on the list are of little relative importance. Of the total for cedar, 748,626,000 shingles were made from eastern white cedar, as compared to 643,484,000 of western red cedar from British Columbia.

The total production of shingles was 1,485,279,000 pieces in 1913 and 1,578,343,000 pieces in 1912. The value of the 1913 production was $3,064,641. The average value per thousand was $2.06 in 1913 and $2.01 in 1912.

## Practical Logging Cost Accounting

By S. B. Detweiler*

The importance of an accounting system that will show the comparative costs of the various logging operations is easily understood. The primary requisite is that the system be simple, so that it may be kept by the camp clerk without imposing an excessive burden on him. The logging cost-accounting system explained in this article was devised and used by the writer with very satisfactory results. It is also well adapted to nursery work and other lines of forestry.

The first step in starting a cost-keeping system is to determine the amount of detail which is necessary or desirable. This is best done by omitting the camp activities. The following division of the work of the camp into accounts or projects is convenient, but any arrangement may be used that will form the necessary basis for comparison.

**General Accounts**

1. Superintendence (foreman, clerk).
2. Store.
3. Kitchen (supplies, cooking, labor, fuel, garden, etc.).
4. Stable (labor, feed, medicine, repairs to harness, making hay, etc.).
5. Camp (bull cook and miscellaneous labor, toting, miscellaneous repairs, and miscellaneaus supplies).
6. Shop (blacksmithing, filing, carpentering, supplies for shop work).
7. Tools and implements (shop tools, camp tools, logging tools, kitchen utensils).
8. Equipment (permanent buildings, machinery, barges, etc.).

**Logging Accounts**

9. Road work (construction, icing, rutting, snowing).
10. Felling (under-cutting, sawing down, bucking).
11. Skidding (swamping, skidding, decking).
12. Banking (loading, hauling, landing).
13. Rafting (or loading on cars).

**Forestry Accounts**

14. Burning brush (piling and burning).
15. Protection (patrol, fighting fire).
16. Planting (nursery, planting).
17. Thinning.
18. Estimating.

The Moore system of loose-leaf sheets and binders was used for keeping all accounts. The sheets (5 inches by 8 inches) are of convenient size and may be arranged in any order that is found desirable. The binders are quickly and easily operated and a sheet may be removed or inserted without disturbing the others. For a small camp, one binder is sufficient for all accounts. For a camp of 125 to 150 men three binders are required, one for time sheets, one for general accounts and one for logging and forestry accounts, with transfer binders when necessary.

The details of operating the system are as follows:

1. Time Sheet—Time is kept in the actual number of hours worked, by two daily visits of the timekeeper to each crew. Each man and each team has a separate monthly time sheet, on which the time is entered by projects. It is advisable to tally time for the actual occupations in which the men are engaged, and enter the number of the project to which the work belongs in an adjoining column. In transferring the figures to other sheets only the totals for the main projects to which such occupations belong need be used. The advantage of detailed time-keeping lies in the readiness with which the cost of special phases of the work may be obtained at any time. Because of the small size of the sheet, two lines are devoted to each project, the upper line for the first half, and the lower line for the last half of the month. Six separate accounts may be tallied on one sheet; if a man works on more than six kinds of work in a month, a second sheet is used. The last three columns on the right side of the sheet provide for the total number of hours of work, the rate, and the amount due on each project for which time was tallied. At the bottom of the sheet space is provided for total earnings, deductions and balance to date. The back of the time sheet is used as a journal to itimize store account, laundry, hospital fees, transportation, and payments made during the month.

2. Monthly Pay Roll.—This is a large sheet, to which the totals on the time sheets are transferred and summarized by projects. The total wages, deductions and number of the pay check for each man are also included, in ordinary pay roll form.

3. Time Summary.—A sheet similar to the pay roll is used to summarize the number of hours of work on each project, including horse labor. The number of hours worked on each project is then reduced to days, using ten hours as the unit.

4. Boarding Account.—An inventory of kitchen supplies and horse feed is taken at the end of each month. The cost of the supplies consumed is added to the cost of kitchen and stable labor, as shown on the pay roll under those projects. The daily cost of board of men and teams is then computed, using the total number of days as shown in the time summary (less the number of days of kitchen and stable labor) to obtain the unit cost per man or team. Order sheets, in which the names of the various supplies are printed alphabetically with adjoining columns for amount, price, and value, are useful in taking these monthly inventories. The work is further simplified by keeping a price sheet posted in the office on which all articles purchased are listed. This sheet has a number of columns after each article listed, in which the clerk enters the latest prices from the bills as they come in.

5. Monthly Report.—This is a monthly summary by projects (except kitchen and stable accounts) of the number of days of labor, wages, and the pro rata cost of board for men and teams. A column provides for the cost of tools, equipment and supplies purchased (other than those already cared for in the kitchen and stable accounts). Additional columns are provided for the total cost of each project, the material handled on each project, and the cost per unit of material handled. The condition of the work and the amount of material handled may be learned approximately, in those projects where no scaling is done, by having each crew report daily the number of logs handled. This also encourages competition among the crews.

6. Project Reports.—A form similar to the monthly report is devoted to each project. On this sheet the figures given in the monthly reports are entered by months, in regular order. The project reports constitute the camp record, the monthly report being sent to headquarters.

7. Annual Report.—The annual report is a summary of the figures given in the project reports, using a form and arrangement identical with the monthly report. An inventory of tools and equipment belonging to all of the general accounts is made at the end of the year or season and the annual cost ascertained. The expenses of the general accounts, exclusive of kitchen and stable accounts (superintendence, camp, shop, tools and equipment), may be distributed among the logging accounts, making the basis of division either the total days' labor, or the total wages expended on each project.

8. Journal-Ledger Forms.—All expenditures other than labor (stores, tools and equipment) are posted directly from the bills to journal-ledger forms under the project headings. The bills are then O.K.'d and sent to the main office for payment. The items are entered singly, with the name of the firm from which the purchases are made. These are totalled monthly, for use in the monthly report. At the end of the year the journal-ledger sheets for shop, tools and equipment accounts are added to the inventory sheets of these accounts which were made at the beginning of the year, making a complete list to use as a basis for the new inventory. The same journal-ledger forms are used for outside accounts in cases where bills are paid from the camp instead of from the main office.

## Dry Rot in Factory Timbers—Important Report by F. J. Hoxie

"Dry Rot in Factory Timbers," which has attracted so much attention of late, is the subject of an exceptionally complete and valuable treatment of the subject by Mr. F. J. Hoxie, of the Inspection Department of the Associated Factory Mutual Fire Insurance Companies, Boston, Mass. Mr. Hoxie has previously made public the results of his investigations into this subject. His latest publication, however, contains much new and important matter not included in his former reports. The present pamphlet, which is extensively illustrated, contains the following discussion of the subject by way of preface:—

The interest of the Factory Mutual Insurance Companies in Dry Rot of Timbers is threefold.

First: They have for fifty years been sponsors for so-called slow burning or mill construction. The economy and integrity of this excellent type of building is threatened by the remarkable increase in the prevalence of dry rot during the past few years.

Second: Wood infected by dry rot ignites more easily than sound wood and mill timbers with rotted ends fall more quickly under fire.

Third: The officers and engineers of these companies believe that the dangers of dry rot can be largely eliminated, with the consequent saving of many thousands of dollars to Mutual members.

Thirty cases of dry rot, of greater or less magnitude, have been brought to the attention of the Mutual Companies within the past three years. Several million feet of lumber were involved, and, in some of the worst cases the safety of important structures was menaced. There were undoubtedly many other cases which have not been reported. The direct money loss to Mutual members from this source is undoubtedly many thousand dollars each year in addition to the increased fire and life hazard from loss of strength and greater combustibility of rotting structural timbers.

The varieties of fungi causing this destruction of factories are apparently few, and, while their habits and requirements are not well known, it is evident that the supply of moisture and the temperature are important controlling factors.

Each variety of timber has its own peculiar fungus destroyers, and, as the number of varieties of timber practically available for mill construction is limited, the problem is somewhat further simplified and resolves itself into the selection of timber with the greatest natural resistance to fungi practically attainable, and seeing that this is dry and free from dangerous living fungi when placed in the structure.

In most cases, it is well worth the cost to thoroughly heat the building by use of its heating system as soon as possible after it is completed. This will hasten the drying and kill surface growths of dangerous dry rot fungi. This may fill all requirements in buildings of dry occupancy.

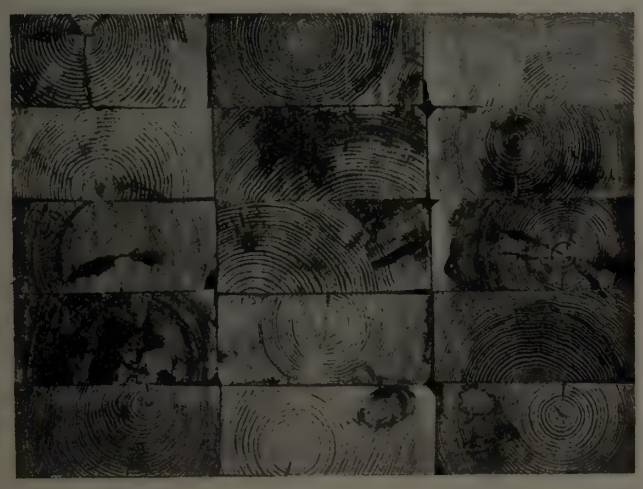
The moist atmosphere present in such processes of manufacture as paper making and cotton weaving, introduces conditions which probably no variety of wood now practically obtainable can withstand continuously without having its natural resistance to fungi reinforced by artificial antiseptic treatment.

Timber of uniformly high natural resistance to fungi is difficult, if not impossible, to obtain by grading methods now in general use. The dence resinous longleaf pine from the butts of trees, which has been used in the past, has proved satisfactory. The present supply of so-called "Commercial longleaf pine," comprising all varieties of Southern pine (North Carolina, shortleaf, loblolly, and Cuban, mixed indiscriminately with true longleaf), is proving far less reliable than the supply of former years, and thus far no standard specifications have been adopted by means of which the purchaser can assure himself of the reliability of the lumber delivered.

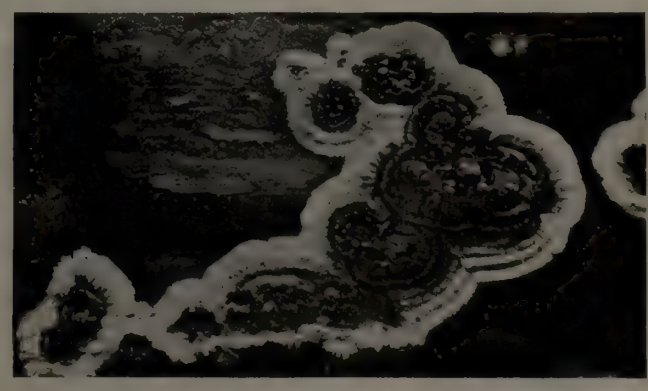
The percentages of rosin and the density are undoubtedly valuable indices of durability and strength. The rosin test is somewhat cumbersome to apply and is not recognized by the lumber trade. The density is roughly covered in the "Growth ring" or "Grain band rule" recently adopted by several lumber associations.

It is probable that a close observer, who has had considerable experience with Southern pine, could select resinous dense wood with considerable certainty, and it would doubtless be worth while for a large user of Southern pine to employ such a man as buyer at the sawmills. This is done by some of the German lumber importing companies. It is, of course, necessary to pay a premium for such selected timber, but it is well worth it, as an unreliable wood in an important structure would be expensive as a gift. This plan is impracticable with the small or occasional purchaser, and to such the only course that can be at present recommended is to buy heartwood timber, of which the density, as indicated by the grain bands, is sufficient to insure the required strength, and to give this a chemical treatment of sufficient antiseptic power to kill any latent fungi that it may contain and to protect the surface from later attack.

The process of antiseptic treatment, which, from the small amount of experience thus far available, appears to be best adapted to use on mill timber, is to soak it for a week in a one per cent. solution of corrosive sublimate dissolved in water. This has been done at the mills in several cases recently, the treatment, with good heatrwood, costing about three dollare a thousand. Lumber already treated with



Part of 750 8" x 18" beams removed from a new factory in Montreal, after only three years' service, because rendered unsafe by decay.



Coniophora, with fruit, on a beam removed from a cotton factory in Canada. Scale one-third natural size.

corrosive sublimate can be obtained commercially, at a reasonable price, where it is desired to avoid the inconvenience and delay necessary for treatment on the job. When such treated timber is used, care should be taken to thoroughly swab with corrosive sublimate solution all parts of the interior of the stick that are exposed by cutting after the treatment is applied.

The problem divides itself into two parts:

First, that of untreated timber, or the possibility of securing uniformly reliable timber at a permissible price, which possesses sufficient natural resistance so that unaided it can withstand fungus in the moist atmosphere found in many rooms in textile mills, or in paper mills.

Second, that of timber treated antiseptically, or timber which can be had in suitable lengths and sizes, with sufficient strength for the required load, and which can be given the necessary resistance to fungus by chemical treatment.

In the past, good quality longleaf pine has given satisfactory service without antiseptic treatment; but the present supply, which comprises much loblolly, shortleaf and poorer longleaf, is lacking in natural resistance. Therefore, in order to make sure of obtaining a grade of Southern pine which can be used safely without antiseptic treatment, the present system of grading must be revolutionized, and based upon those physical and chemical properties which underlie strength and resistance to fungus rather than upon the vague botanical distinctions now in use.

### Suggested Specifications

In making contracts for beams, columns and plank to be used in "Slow Burning Construction," the following specifications are recommended:

Density. No part of the material shall have a density of less than 30 pounds per cubic foot when tested by boring smooth holes one inch in diameter and two inches deep in the ends of the stick, drying to constant weight at 212 deg. F. and weighing the borings and computing the density from the volume of the hole.

Rosin. None of the heartwood shall show less than four per cent. of rosin by weight when borings are taken with a one-inch bit with a hole two inches deep, dried to constant weight at 212 deg. F. and extracted with benzole, the extracted rosin evaporated until it is not soft or sticky when touched with the finger at 70 deg. F.

Heartwood. Heartwood shall show in all four faces of every stick, and sapwood shall not extend more than two inches from the corner at any place, measured perpendicularly to the corner across the face.

Growth Rings. For timber 6-in. x 8-in. or larger, there must show on the cross section between the third and fourth inch, measured radially from the heart centre or pith, not less than six annual rings of growth, a majority of which shall show at least one-third summerwood, which is the dark portion of the annual rings; but wide ringed material excluded by this rule will be acceptable, providing that in the majority of the annual rings the dark ring is hard and in width equal to or greater than the adjacent light colored ring.

For pieces in which the centre is not included, there must show on the cross section, an average of not less than six annual rings of growth, with not less than one-third summerwood. Timbers will be rejected in which there is no sharp contrast in color between the springwood and summerwood.

Defects. No timber with knots greater than one inch in diameter, or rot, or injurious shakes will be accepted.

Branding. Longleaf pine sold under this specification shall be branded with the letters "F. M.," the name of the lumber manufacturer, the location of the sawmill from which it comes, and the date of sawing, in letters at least one inch high.

### Would Be Much More Expensive

The above specifications will require selected longleaf pine from the butts of trees and will undoubtedly command a considerably higher price than "commercial longleaf pine." It will also be worth a higher price. It is a "grade" not known to the lumber trade at present. There is some of it in the South, but, by methods now in use, it is mixed with poorer timber and its good qualities are lost, as it is not the average, but the poorest that characterizes the lot.

The place of shipment is no guarantee of the quality of the stock, as in most places where longleaf pine is growing there is also shortleaf and loblolly.

In some places, the proportion of longleaf is greater than in others. The care and good reputation of the lumber manufacturer is of more importance in assuring good material than the place of shipment.

New lumber frequently contains living fungi in a latent form which is difficult to detect. This difficulty is increased by the common practice at many lumber yards of planing the stock just before it is delivered. The only outward manifestation of fungus in the wood is frequently an inconspicuous brownish tinge. Nearly every lumber pile on careful examination will show a considerable proportion of fungus-infected sticks. In some cases these sticks contain tree fungi that are already dead and harmless. Living plants often start growing in the lumber pile, particularly if the weather is damp, showing lacelike growths between the sticks when the pile is taken down. Lumber showing such growths had best be given an antiseptic treatment if the conditions under which it is to be used are at all moist.

In several cases, serious rotting has been caused by timber which was water-soaked by being left uncovered during a long season of rainy weather, and covered in without provision for drying. When it is necessary to use such water-soaked timber, it will be well worth while to hasten the drying as much as possible by use of the heating system.

Kyanizing can be conveniently done on the job by constructing a tank of concrete or plank of such shape that the material can be packed into it with the least possible voids. It should be weighted or held down with bolts so that it cannot float when the solution is added. This should consist of corrosive sublimate dissolved in water, one pound to twelve gallons of water. The lumber should soak in this solution for a week. The absorption will vary according to the quality and variety of the lumber from two or three per cent. to forty per cent. Care must be used in handling the corrosive sublimate as it is very poisonous if taken internally.

---

Mr. Wm. Power, M.P., of W. & J. Sharples, Quebec, P.Q., returned recently from a visit to Great Britain and favored the Canada Lumberman with an interesting discussion of the war situation. Speaking of the Balkan States, Mr. Power stated that they are likely to prove a most important factor in the war. Their military ability has not been fully appreciated by the outside world. Roumania alone has 700,000 picked and well trained men ready for action. Mr. Power believes that Italy will ultimately enter the war in order to protect her own interests. Discussing the shipping situation, Mr. Power stated that the congestion in British ports is gradually being reduced. English people are not very much bothered about the German "blockade," despite the fact that freight rates and marine insurance have advanced to very high figures. Canada probably will feel the increased rates of freight for some time. They will be felt, in fact, all over the world. Ships will not be plentiful this year as the British Government has taken over 1,500 vessels already. One of Mr. Power's sons, Mr. Joe Power, is serving at the front with the first contingent.

---

Mr. Peter Lund, Wardner, B.C., has resigned his position as managing director of the Crow's Nest Pass Lumber Company. Mr. Lund and his late partner, Mr. John Breckenridge, organized the Crow's Nest Pass Lumber Company about twelve years ago. They acquired large timber holdings on the Kootenay River and its tributaries and built their large mill at Wardner. Mr. Lund had also associated with him at that time Mr. Wm. Carlin, Alfred Doyle, of Fort Stelle, and Chas. P. Lund, a brother, residing in Spokane. The controlling interest in the company was acquired about five years ago by United States capitalists from Manistee, Mich. Since then about $1,600,000 of new capital has been put into the company and about 600,000,000 feet of standing timber has been added to its holdings. The property has been extensively developed and is now one of the largest producers in the province. Mr. Lund, who is a large stock holder of the company, will continue as a director.

---

According to statistics which have just been published the exports of the United States during February, 1915, showed a remarkable increase over February, 1914, the total value being $299,805,869, as compared with $173,920,145 in February, 1914. Imports showed a decline, the totals being, February, 1915, $125,123,391; February, 1914, $148,044,776. Imports into the United States from Canada during February showed an increase, the values being as follows:—1915, $11,438,006; 1914, $10,154,504. During the eight months ending February, the total imports from Canada were valued as follows:—1915, $111,719,350; 1914, $108,031,539. The total exports to Canada during February were valued as follows, 1915, $24,216,370; 1914, $21,322,601. During the eight months ending February the exports to Canada showed a considerable falling off, the total values being as follows:—1915, $197,400,726; 1914, $232.534,315.

### Ottawa Lumbermen Promote Fire Protection

The annual meeting of the Ottawa Fire Protection Association, of which all Ottawa Valley lumbermen are members, was held recently. It was decided to ask Premier Hearst of Ontario to appoint a fire marshal for the province in accordance with an act passed last session; to inaugurate a week-end clean-up week in the capital and to urge the public to greater precautions against fire. Ottawa's lumber manufacturers have suffered heavily from fire during the last year and energetic steps will be taken to guard against this evil in future. The new officers elected include the following: President, Hon. W. C. Edwards; vice-presidents, C. Jackson Booth, Sir Henry Egan and Sir Clifford Sifton. Lumbermen on the directorate are J. R. Booth, J. F. Booth, Gordon C. Edwards, Denis Murphy, Frank Hawkins and R. H. Campbell.

# Fancy Woods and Veneers

THEIR ORIGIN, VALUE AND USE—COMMENT AND VIEWS ON AN IMPORTANT BRANCH OF THE TRADE.

### Uses for Green Ebony

Green ebony (Brya ebenus) yields one of the best known woods in tropical America. It is not a true ebony (Diospyros, a group to which all the black ebonies of commerce belong), but is a leguminous tree allied to our black locust. The wood is known also as cocas, cocos, granadilla or, less often, greenheart ebony. Of all these common names, green ebony is the one in general use. In Jamaica it is considered as a dyewood and it was probably one of the first woods from tropical America employed in the extraction of dyes for coloring fabrics.

The tree is usually rather small, seldom over 50 feet in height and about 18 inches in diameter. Like that of the logwood and other closely allied trees, the trunk is usually short and somewhat fluted, with a rather large, open crown. The sapwood is thin and light yellow; the heartwood is dark green, frequently with lighter and darker streaks. The heartwood is the only portion of the trunk used, and in order to save on transportation, the useless sapwood is cut away immediately after the tree is felled. The wood thus comes to market in the form of a billet, ranging from 2 to 8 or rarely 10 inches in diameter and seldom over 10 feet in length. Dealers and users of this wood claim that the best kind comes from Cuba. The Jamaican product is said to be coarser and more difficult to work, and, in consequence, is offered at less value.

The wood is very hard, heavy, strong, tough, exceedingly durable, and is susceptible of a high polish. The wood of the young branches or saplings is so tough where the tree grows for riding whips and walking sticks. Its durability is said to be due to a water-insoluble resin which is thoroughly diffused throughout the heartwood. The sapwood contains very little of this resin and is, therefore, very perishable in contact with the soil. The resinous substance in the heartwood is very inflammable, and the Indians in the region where the tree grows use the wood for burning as torches and it is sometimes called torchwood.

Green ebony has many uses, both in this country and in Europe. It is particularly valuable in making musical instruments on account of its dark-greenish color, beautiful veining, strength and elasticity. It was formerly used in England in parquetry, but the sticks which reach the markets now are too small and expensive, though it is still employed for this purpose in fine residences. It is at present used chiefly as a substitute for cocobola and true ebony. When particularly well marked it is one of the most attractive woods for the backs of hair brushes, tool and knife handles, rulers, jewelry boxes, pin trays, and small articles of furniture, and for inlaying.

### Greenheart

This tropical South American wood has earned a world-wide reputation on account of its remarkable lasting qualities, according to a pamphlet prepared by the Forest Service. Authentic records prove that, when placed in contact with water or the soil, it shows more resistance to destroying influences than do iron and steel. This durability is due in part to the presence in the wood of an alkaloid known as biberine and in part to the presence of resinous substances. The development of these latter substances largely determines the color of the wood which is known in the trade as yellow, gray and black greenheart. The black is the most durable. The chief use of greenheart is in construction work in ship and dock-building, being used for keelsons, beams, planking, piers and piling. When placed in water it is proof against the ravages of the teredo or sea worm. There are well-known instances where greenheart has stood in wharves for thirty years and under water for one hundred years, still remaining perfectly sound. All the gates and piers of the Liverpool (England) docks are made of this wood, as are also the lock gates in the Manchester ship canal. Greenheart was also specified for use in the sills and fenders of the lock gates of the Panama Canal. The ship Fram, used by Dr. Nansen in his Arctic explorations, was constructed of greenheart, the same wood was also used in the Antarctic ship Discovery. Trestles, bridges, millwork, flooring, and in fact any construction which will have to stand great wear and tear are the best fields for the employment of this wood.

Greenheart is found in the northern countries of South America and in Brazil and the islands of Trinidad and Jamaica, in the West Indies. Its best growth is along the coast and rivers. Greenheart is a large tree. It ranges in height from 60 to 100 feet and from 2 to 4 feet in diameter. The trunks are without branches for the first 50 or 60 feet and furnish fine logs, free from knots. It is a tree which grows very slowly. Estimates place the age of a tree of merchantable size, say 20 inches in diameter, at about two hundred and fifty years. Methods of marketing this timber are antiquated and expensive. All hauling in the forest is done by gangs of men or by oxen. The same care is not used in preparing the logs for shipment as is employed in the case of mahogany and cedar. At present only the regions along the navigable waterways are being exploited. In British Guiana, especially, there are vast forests, lying above the falls of its many rivers, which contain valuable stands of timber waiting only for modern methods to open them up.

### The Possibilities of Elm

There has never been in this country enough appreciation of or enough effort to develop the possibilities of good elm in cabinet work and interior trim. Elm has been extensively used in the furniture trade for many years but generally in the making of cheap furniture in which no effort is made to finish it to bring out the native beauty of the elm. Usually the efforts to finish consist of using a heavy paint-like stain so as to make it look as nearly as practical like oak or something else. Now and then one comes across an instance where some one has made good use of elm in a piece of furniture, where it is properly finished off. Also one now and then finds it used with the same care and appreciation in house trim. These instances are rare, however, and as a general thing there is but little appreciation of the possibilities of elm for face work. Right now there should be a splendid opportunity to develop the use of good elm. Popular taste is turning toward the softer tones in brown and gray, and here elm should enter readily. It has no distinctive figure but it has a soft color. Some gray elm when polished and finished as it should be presents a beautiful appearance and the red elm properly finished should find favor along with the softer tones in brown. It is a wood that has strength and body and will take a good finish, and something more should be made of it than just a material to use for cheap furniture. Elm has possibilities if it were but given anything like the attention and finish that is bestowed upon other woods, and then properly exploited.—Hardwood Record.

### Hardwood Manufacturers Organize Sales Report System

The Hardwood Manufacturers' Association of the United States have just inaugurated a new system for distribution of a monthly report of actual sales made by its members. The members of the Association report to the Secretary each week the actual sales made in that period. The reports show the date of sale, kind of lumber, amount, thickness, grade, widths, lengths, condition of stock, delivered price, point of delivery and rate of freight to destination.

The consuming territory is divided into accurately defined zones. For illustration, the Chicago territory comprises territory surrounding the city of Chicago, which takes practically the same rates of freight from the producing district, and instead of specifying on the report that is sent to the members the name of the town in which the stock was sold, it will simply show "delivered in Chicago territory," and rate of freight given.

The report shows the state from which the stock was shipped. Under this arrangement the shipper of lumber can form a good idea by looking at the report whether or not the prices given were obtained by his immediate competitors or whether it was shipped from a distant territory. The report will be mailed to the membership early in the month. This information will be for the benefit of members only and will prove a valuable service.

### New Schedules of Ottawa Tolls

The Upper Ottawa Improvement Company has secured approval of a new schedule of tolls to be charged to lumber and paper companies, for the use of its works on the Ottawa River during 1915. The proposed tariff as compared with 1914 is as follows: Tolls—6 rates greater, 2 less, and 3 the same as in 1914; boom working and driving, 7 rates greater, 1 less, 2 same as in 1914; towing, 10 rates greater, 1 less, and 1 same as in 1914; towing per hour, 7 rates, same as in 1914. Rates for pulpwood are, generally speaking, 2 saw-log rates per cord of 128 cubic feet.

# WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## Wanted–Lumber

### Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

### Wanted

Genuine Rock Elm Plank in car lots, 3¼ in. thick. Quote prices to St. Marys Wood Specialty Company, Limited, St. Marys, Ont. 8

### Wanted to Buy

Birch, Oak, Maple, Ash and Elm. Apply by letter, stating prices, thicknesses, lengths, average widths, quality, also name point of shipment, to Robert Cox & Company, Hope Building, Ottawa, Ont. 7-10

### WANTED

For early spring shipment
10 cars 4 ft. white pine lath No. 3.
10 cars 4 ft. white pine lath No. 2.
2 cars 4 ft. white pine lath No. 1.
10 cars 4 ft. hemlock lath No. 2.
5 cars 4 ft. hemlock lath No. 1
AMERICAN LUMBER & MFG. CO.,
5-8 Pittsburg, Pa.

### Birch Wanted

I am open to purchase one million feet of 1-in. Birch log run, mill culls out, on a railway rate not to exceed 9c. to Montreal. State how much you have to offer, when sawn and price wanted.

HORACE HARTLEY,
19 Mayor Street,
8-9 Montreal, Que.

## For Sale–Lumber

### For Sale

For shipment May 1st car lots Cheese box, Veneer. G. R. Jones, Eldorado, Ont. 6 9

### We Have a Full Stock

of Hardwood, Hemlock and White and Norway Pine Lumber, Norway and White Pine Piling, up to 60 ft. Keenan Bros., Limited, Owen Sound, Ont. 3t.f.

### For Sale

Half million feet Ash and Basswood 4/4
Half million feet Hardwood Maple 4/4 to 16/4.
Half million feet Hemlock, all sizes and lengths.
Prices for low grades right. Rail or water shipment.
Hall Bros., 174 Mutual Street, Toronto. 8-9

### FOR SALE
### Norway Pine—Mill Run

| | |
|---|---|
| 1 x 4/5 x 10/16 ft. | 1,000,000 ft. |
| 1 x 6 | 500,000 ft. |
| 1 x 8 | 85,000 ft. |
| 1 x 10 | 14,000 ft. |
| 2 x 4 | 165,000 ft. |
| 2 x 6 | 220,000 ft. |
| 2 x 8 | 320,000 ft. |
| 2 x 10 | 218,000 ft. |
| 2 x 12 | 65,000 ft. |
| Norway Pine Culls | |
| 1 x 4 and up x 10/16 ft. | 1,500,000 ft. |

DEVON LUMBER CO.,
5t.f. Ottawa, Ont.

### Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
c Montreal, Que.

### DRY BIRCH FOR SALE
### Shipment Immediately

The following Birch has been on sticks for over two years, and is perfectly dry. Log run, mill culls out.

2 cars 4 x 5 x 10 ft. and up.
1 car 4 x 6 x 10 ft. and up.
3 cars 5 x 9 and up x 8 ft. and up.

Apply HORACE HARTLEY,
19 Mayor Street,
8-9 Montreal, Que.

## Wanted–Machinery

Mershon Band-Resaw wanted, 54-in. or 60-in. wheel. State full particulars. Box 178, Canada Lumberman, Toronto. 8

### Wanted

Second-hand Band Re-Saw. Send full particulars and quote best cash price to Savoie & Company, Manseau, Que. 7-8

## For Sale–Machinery

### Woodworking Machinery For Sale

1 No. 51 Crescent universal woodworker; 2 24-in. planers and matchers; 3 12-in. buzz planers; 1 12-in. four-side moulder; 1 No. 802 Canada Machinery Corporation shaper; 5 30-in. Ideal pedestal bandsaws; 2 No. 619 Canada Machinery Corporation saw tables; 1 36-in. double drum sander; 1 20-in. American wood scraper.

H. W. PETRIE, LTD., Toronto.

### Rebuilt Veneer Machines

We have the following rebuilt Coe veneer lathes and clippers ready for immediate shipment:

Lathe, 50-in. swing, 88-in. knife, 6-in. spindles.
Lathe, 50-in. swing, 64-in. knife, 5-in. spindles.
Lathe, 50-in. swing, 76-in. knife, 6-in. spindles.
100-in. power clipper.
64-in. foot power clipper.

These machines are decided bargains and carry the same guarantee as we give our new ones. Prices on application.

THE COE MANUFACTURING COMPANY,
23t.f. Painesville, Ohio.

## Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Band and saw filer wants position. Strictly reliable, steady and up-to-date. Thoroughly dependable. Best references. Box 181, Canada Lumberman, Toronto. 8-11

Expert Band Saw Filer wants position. Fourteen years' experience on single and double cut saws. No proposition too large. Guarantee satisfaction in hard or soft woods. Strictly sober. A No. 1 reference. Address Saw Filer, P. O. Box 592, Memphis, Tenn., U.S.A. 6-10

Position wanted by factory superintendent. Have learned the business by practical experience in large factories. Managed all branches. Expert in the manufacture of veneer and veneered cabinet work. Special knowledge of planing factory construction and equipment. Good organizer and cost reducer. Best credentials. Box 397, St. Jean, Que. 6-8

A Forest Engineer—in government employ, who has received his technical training in Canadian and American Universities, and has done technical work in the main forest regions of Canada—east and west, with several years of practical experience—bush and lumber yards, previous to studying forestry, desires to hear from large firm or lumber association. Knowledge of French and English. Best credentials. Box 173, Canada Lumberman, Toronto. 8-9

## Business Chances

### For Sale or Exchange

For sale or in exchange for lumber, a small planing mill in Hamilton, fully equipped with machinery and Hydro-electric power, private siding. Box 177, Canada Lumberman, Toronto. 8

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

### WANTED

Salesmen selling supplies to Lumbermen and Contractors to handle as a side line Dr. J. M. Stewart's Veterinary Remedies, now being used by the greater number of Lumber Companies in Canada. Liberal commission.

PALMER MEDICAL CO., LTD.,
7-t.f. Windsor, Ont.

### FOR SALE

The Lumber Yard of the Estate of D. Dupuis, situated on St. James Street, Hull.

The property comprises a valuable block of land, having frontages of 254 feet on St. James Street, 221 feet on Leduc Street, 142 feet on Wellington Street, and 210 feet deep between St. James and Leduc Streets.

The yards are stocked with a large quantity of valuable lumber of all kinds.

The business is a good going concern, having a large trade, and was established in 1890. It can be purchased en bloc, or the lumber and rolling stock can be bought separately and the land rented.

The property is a valuable building site, suitable for subdivision into city lots, and is situated right in the heart of the business section of the city.

For particulars apply to P. H. Charron, 142 Champlain Ave., Hull. 7-10

## Miscellaneous

### For Sale

Copies of "The Preservation of Structural Timber," by Howard F. Weiss. Published in 1915 by McGraw-Hill Book Company. 312 pages, illustrated. Price $3.00. Canada Lumberman, 347 Adelaide Street West, Toronto.

### Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

### Tug Boat For Sale

Wooden hull, strongly built. Length 54½ ft., beam 15 ft., depth 5 ft. 9 in. Compound engines 8 in. x 16 in. x 12 in., condenser, steam winch, Jenckes Marine boiler 7 x 7 ft., two corrugated furnaces. All in good condition. Apply to

J. RICHARDSON CO., LTD.,
5-8 Masane, P.Q.

### Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

### SALE BY TENDER
### OF

Lumber business and stock of lumber belonging to the Estate of the late Thomas L. Gillies, Port Dover, Ontario. An established business of upwards of 35 years.

The following is an estimate of stock on hand:

| | | |
|---|---|---|
| Norway Pine and sized Hemlock | ft. | 20,290 |
| D. 4 S. Pine | ft. | 6,500 |
| Base and Casing | ft. | 1,770 |
| White Pine flooring and matched lumber | ft. | 4,000 |
| Quarter Round and Cove ... bundles | | 3 |
| Door stops | ft. | 480 |
| Crown Mould | ft. | 234 |
| Bevel Siding and Ceiling | ft. | 4,800 |
| Novelty Siding | ft. | 3,000 |
| 1-in. Georgia Pine | ft. | 580 |
| 2 in. x 2 in. Red Cedar | ft. | 1,000 |
| XXX and XXXX Red Cedar Shingles | Thousand | 205 |
| No. 1 White Pine Lath | Bunches | 415 |
| Cedar Posts | | 150 |
| White Pine Doors | | 12 |

About one-quarter of an acre of land with a frame storehouse thereon used as a lumber yard will be sold. Tenders should be sent in separately for the stock, business and goodwill and the land and storehouse and also for the whole en-bloc, including goodwill, stock, land and storehouse.

The highest or any tender not necessarily accepted. Tenders must be mailed and addressed to Miss Martha Gillies, Port Dover, Ontario, and received before 12 o'clock noon on the 26th day of April, A.D. 1915, marked "tender for lumber business." The stock and premises may be inspected.

KELLY & PORTER,
Simcoe, Ont.,
Solicitors for said Estate.
Dated April 7th, 1915. 8

### Important B. C. Conference

An important conference took place on April 2nd, between members of the British Columbia Lumber & Shingle Manufacturers' Association, Hon. W. R. Ross, Minister of Lands, and H. R. MacMillan, Trade Commissioner, who has been entrusted with a special mission on behalf of the Federal Government, to discuss ways and means for improving the present position of the timber industry of British Columbia. The conditions of the export trade were discussed critically, and, while opinion was unanimous that there is every assurance of an early big demand for the lumber products of the province, it was felt that every possible effort must be exerted if success is to follow the attempts now

being made to remove the disabilities under which the trade is suffering.

Representing the lumbermen's association there were present E. J. Palmer, of the Victoria Lumber Company, Chemainus; G. S. Raphael, of the North Pacific Lumber Company, Barnett; D. O. and J. O. Cameron and J. Mitchell, of the Cameron Lumber Company; G. Knight, of the Vancouver Lumber Company; R. H. H. Alexander, secretary of the association; J. D. McCormick, of the Canadian Western Company; and E. Hamber, of Hastings Mills.

Discussion mainly centered on the question of the best method of expending the appropriation of $50,000 made at the last session of the legislature. Some members of the deputation were of the opinion that an effort might properly be made to remove the disability of excess freight charges of shipping imposed by vessel owners on British Columbia exporters.

Mr. Ross assured the deputation that there was no question now giving the Government more concern than that of removing as far as possible those disabilities under which the trade suffered, nor were there ever brighter assurances that the joint efforts which were being expended both by the Government and lumbermen themselves would bear fruit. Signs of an increased demand for lumber were to be noted, and they were most encouraging. He was very hopeful that, as a result of Mr. MacMillan's tour of foreign markets, much would be accomplished to put the industry on a better basis.

Mr. MacMillan sketched what he hoped to accomplish in his forthcoming tour in the interests of the Canadian lumber trade generally. He would visit nearly all of the great overseas markets, study local conditions on the spot, make the most thorough investigation into all questions bearing upon his inquiry; and he felt some assurance, with his knowledge of the position of the lumbering industry in British Columbia, that he would be able to accomplish something in the way of removing disabilities.

The members of the deputation expressed themselves as pleased with the aggressive and intelligent interest which was being taken in the position of the lumbering industry by Mr. Ross and his colleagues of the Government; they had the utmost confidence that ultimately the broad and comprehensive policy now being pursued would be crowned with success.

---

### The Land of Beech Trees

The present war has brought into notice the Austrian province Bukowina. The Austrian defenders and Russian invaders have pushed each other back and forth across it many times in the past half year. The name means "land of beech trees." The word "buk," with its other forms "boc," "buck," "beech," "book," and many other variations in spelling and pronouncing, is one of the most remarkable known. It is said to be the oldest existing word in the world. It has been traced to northern India where the people speaking the Sanskrit language used it for "beech." and "book." It is supposed they cut letters on beech bark, hence they used the same word for the tree and the writing on its bark. The word is still in use in various forms in all northern Europe. Even in far away Iceland "bok" means beech. The Russians change it a little and call it "buk." The English, Germans, Austrians, and Russians all agree on that one word for beech, and it is probably the only word on which all of them agree. The word buckwheat comes from the same source, because the grain of buckwheat is triangular like the nut of the beech. The Greeks and Latins refused to adopt the word; but the Latins translated it, by using the word "liber" (bark) for "book." The Greeks, however, were not willing to adopt or even translate the foreign word, so they called the beech tree "eat," because the nuts were edible. The word used by them was "phegos," which, in its latinized form, "fagus," has come down to us, and botanists use it as the generic name for beech—Fagus atropunicea being the botanical name for the common American beech. It has been said that it is easier to conquer than to change their language, and the case of Bukowina seems to carry that out. It is hard to say how many owners it has had since it was first named on account of its beech trees, perhaps in prehistoric times. In spite of its many owners, including the Romans, the Hungarians, and the Turks, it still carries its old name. The Romans called it Dacia, it forming the extreme northeastern part of that province in the period of the Roman empire's greatest extension. It is said that Bukowina and Brazil are the only two countries in the world named for trees, though innumerable islands and small districts are so named.

---

### Elements Impair Strength of Wood

Little diagonal streaks or wrinkles across the grain of a piece of timber not only betray weakness, but sometimes indicate periods of stress through which the wood passed when it was growing. They may even be taken as a sort of check on the official record of wind storms, as in the case of some lumber tested at the Forest Service Laboratory at Madison, Wis.

The marks are caused by what are called "compression failures," which occur when the fibers bend or buckle under a too heavy strain. In cutting up logs collected for experiments at the laboratory, it was noticed that these compression failures appeared on the north side of a number of trees which came from the same locality in Florida. By counting the annual rings of the wood and from knowledge of the time when it was cut in the forest, it was decided that the compression failures must have been caused by a severe wind from the south about the year 1898. Inquiries were made in Florida and it was found that a hurricane had, in fact, swept over the region at the time indicated.

The experiments have determined that the strength of a piece of wood may be seriously impaired by slight compression failures due to rough handling. Dropping a beam across a skid may cause a compression failure at the point at which the beam strikes the skid and it will be at this point that the beam gives way when it breaks under a strain too severe for the weakened fibers to withstand. Hitherto unaccountable breakage in hickory wagon spokes and other presumably strong material is now attributed to compression failures caused by wind storms in the period of growth or by hard usage in lumbering and manufacturing processes.

---

### Creosoted Fence Posts

There is an interest now being manifested by the retail lumber dealers of the country in the subject of creosoted lumber and timber, and a part of this interest is turning to fenceposts, says the St. Louis Lumberman. It seems that there are a fair number of inquiries for creosoted fenceposts and quite a live interest manifested in the subject by farmers, which is naturally arousing more interest on the part of the retail dealers.

The question of concern to the retailer that was developed at some of the State conventions this winter and spring is how they may prepare themselves to supply creosoted fenceposts. Some have asked where they can secure them, while others have asked about the possibilities of creosoting posts and timbers for farm use themselves.

Here is a place where there will evidently be something doing in the lumber world in the course of the next year or two. So far progress in creosoting for factory and mill timbers and things for that kind has mainly been with the big yellow pine mills, which are not the institutions that make fenceposts as a rule, because the majority of the fence posts are hardwood, being cedar, locust, oak or some other hardwood.

Ties and railway timbers of hardwood are as a rule creosoted under contract for the different railway lines by persons specializing in the creosoted business fitting up plants for this purpose at some concentrating or distributing points.

So far there does not seem to have been any great concentration of thought or effort on the matter of fenceposts, on the assembling, creosoting and distributing of them. There was developed at the various retailers' conventions of the year, however, plenty of evidence that the time is ripe for some action in this matter. The most logical idea that suggests itself right now in this connection is that of wholesale yard men in the hardwood business taking up the work of assembling and distributing fenceposts and establishing a creosoting plant at which they can treat them and treat any other hardwood timbers that they may have a call for.

The local retailer can get fence posts from various sources and thoroughly dry them out and treat them with what is called the open-tank process and obtain some results. It is contended by those who are informed upon the subject, however, that this treatment, while prolonging the life of the post somewhat, is not to be compared with the results obtained by the vacuum system of injecting creosote, which calls for an equipment that is too costly for the retail yard man to install. The answer seems to be for some of the wholesale yard men or some of the creosoting concerns to take this matter up and work it out systematically. Anyway, whether this is the best answer or not, one of the distinctive things that has been developed during the winter convention season of retailers, is that the retailers of the country are interested in the creosoted fenceposts and are ready and anxious to make connections that will enable them to supply these to their customers.

# Review of Current Trade Conditions

### Ontario

The lumber trade in Ontario has shown a slight improvement since the fine weather commenced. In the country districts there is a continuance of the demand for lumber on the part of farmers. This movement is now of fairly good proportions and is steadily broadening. The fact is well established that the farming communities are in possession of sufficient money to enable them to undertake enlargements and alterations to their buildings which have been postponed for some years. In the aggregate this movement is of considerable proportions, and is keeping retail stocks moving. In the cities of Ontario the movement of stock into consumption continues very slow, but recently there have been some signs of improvement. In Toronto, the retail trade reports increased activity, and the applications for building permits are increasing to a fairly encouraging extent. At Ottawa the outlook is improving, both in the local and export trades. The duty of 7½ per cent. recently placed upon rough lumber entering Canada is already reported to have assisted the home markets for Canadian lumber. The strong demand for eastern spruce in Great Britain is resulting in a disappearance of that stock from Ontario markets. This and the duty upon United States stocks, are expected to make market conditions in Ontario much more satisfactory from the Ontario manufacturer's point of view. The production in the Georgian Bay district will be heavy this year, unless driving conditions should not be favorable. The present indications are for good drives, and as the winter was one of the best on record for woods operations a large cut is expected at the mills. Most of the north shore mills have already disposed of their cuts for export to the United States.

### Eastern Canada

Lumber trade conditions at Montreal are still quiet. The local trade is inactive, as building operations are very light. In the country districts of Quebec it is expected that some improvement will become evident soon. Conditions in general throughout the province are good and are better in the country districts than in the cities. There is greater activity among the box manufacturers at Montreal, on account of substantial orders for ammunition boxes. It is expected that this business will last for some time. Spruce is still being bought in large quantities for the British market. It is encouraging to note that shippers have met with a little more success in securing steamship room. The rates are varying from 100s. to 125s. per standard, according to the port. There does not seem to be much probability, however, of securing sufficient room this summer for all the stock that will offer. It is not unlikely that tramp steamers may come to Montreal and relieve the situation to some extent. Some of the principal exporters are discussing the possibility of chartering tramps to carry full cargoes of lumber.

Steady improvement in the demand for spruce is reported from Boston. The output of eastern mills shows no increase. The base quotation on frames is now strong at $24 with indications of advance. There is a little better enquiry for random. The current range is: 2 x 3, $21; 2 x 4, $22; 2 x 5, 2 x 6, 2 x 7, $20.50 to $21; 2 x 8, $22 to $22.50; 2 x 10, $23 to $24; 2 x 12, $24 to $24.50. Covering boards 5-in. and up wide, 8 ft. and up long, are selling at $20. At New York the demand for eastern spruce also shows steady improvement. The demand for shingles at Boston is broadening. Country yards are the best buyers. Prices, however, continue slow. White cedar extras are offered at $3.30 to $3.40, clears at $2.80 to $2.90 and second clears at $2.50 to $2.60. The enquiry for red cedars shows a little improvement. Quotations, however, show a very wide range, extras being offered all the way from $3.65 down to $3.25. The demand for lath is increasing and prices are firm. Prompt delivery on 1⅝-in. stock has been made at $4.20 and several manufacturers are asking $4.25. Some new business is being taken at $4.15, Boston rate, and $4.10 has been accepted for contracts for the entire output of a mill. For 1½-in. the average price is $3.75.

### Great Britain

No noticeable change has developed in connection with c.i.f. values of spruce deals in the west coast ports of Great Britain. Values, in fact, are entirely regulated by the cost of freight. F.o.b. values continue firm and there is little or no likelihood of any decline. Freight rates are reported to be stiffening daily and 130s. per standard from St. John, N.B., to the west coast of Great Britain is a common quotation. In fact it is reported that this figure has been refused. Spot quotations are very firm, but there is practically no speculative buying on behalf of the consumer. Goods arriving are nearly all going direct into consumption, and available supplies are not sufficient to meet the current requirements. The outlook for the next few months is rather obscure, but it seems certain that any goods arriving will be easily disposed of, even at considerably higher prices than those which are now being quoted.

The spot market at London continues fairly active with consumption about normal. It is not expected that house building will be extensive this year as present prices of materials and labor are high. Deliveries at London docks for the week ending March 20th amounted to 3.474 standards, as compared with 3,211 standards during the corresponding week of 1914. At Churchill & Sim's recent auction sale 3 x 11 firsts, seconds and thirds St. John, spruce was sold at £17 15s. Best Ottawa pine, 2 x 11 brought £30, 2 x 9 ditto £27, 1 x 11 £28, and 1 x 9 £25.

No important change is reported in the timber market at Liverpool. A fair amount of business is in progress and stocks on hand are light in the cases of most of the prominent articles. The demand for spruce deals continues strong. Importations of spruce deals are still very small and the stocks are practically sold out. Quotations for New Brunswick and Nova Scotia spruce deals are difficult to fix. Birch c. i. f. values continue firm. There is a fair enquiry, but not much business. Spot values are increasing, as stocks diminish. Logs are now practically all gone into consumption and planks are gradually becoming scarcer. There is a good demand for boards, especially prime grades, and stocks of these are light. At Manchester, there is no change in the general trade activity. War Office work is greatly in evidence and is taking up a lot of timber. Spruce prices continue firm.

At Glasgow, business continues on the same lines as in recent weeks. Deliveries into consumption are fully maintained. Arrivals continue on the light side. A few Quebec shippers, or their representatives, were recently in Glasgow but it is reported that they were not very successful in making contracts.

### United States

A slow but fairly steady improvement is reported in general business conditions in the United States. Gradually factories are increasing their output and the number of unemployed is being reduced. The improvement, however, is so slow and slight that it is not reflected to any considerable extent in the markets for raw material. The demand for lumber from the industries, however, does show some small gain. Although matters relating to stock markets are not as a rule definitely important to the lumber trade, the fact that the New York stock market has recently been opened to unrestricted trade is of much interest and importance, because it indicates definitely a full confidence in the financial strength of the country. Important changes have been taking place financially in the United States during the past few months. Exports have been increasing to a remarkable extent and the United States, which formerly was a borrowing nation, has become a lending nation. Business generally in the United States is showing some tendency to adopt a waiting attitude, in the expectation that the war will come to an end in six months at the latest and that thereafter there will be a world-wide readjustment of finances and credit. Lumbermen in general, however, take the view that after a declaration of peace there will appear a tremendous demand for lumber for export, a demand which will last for a year or so, and possibly mean a permanent enlargement of the export trade in forest products. There is no question that large amounts of lumber are needed abroad and would be taken if there was any prospect of filling them. Because of the scarcity of tonnage and inability to make shipments, mills that otherwise would be exporting their cut are trying to place their stocks on the domestic markets which are already heavily burdened with supplies.

White pine in the lower grades is showing a little more activity, but the upper grades are slow. A little improvement is reported in the trade in northern hemlock, but there is apparently an over-supply of eastern hemlock. The stronger demand for eastern spruce, however, is helping this situation. Supplies of spruce in Canada and New Zealand would be cleaned out by the foreign demand if there were sufficient vessels to move them. Manufacturers, realizing this, are inclined to hold their stocks rather than sacrifice them in domestic markets. This influence is having a favorable effect upon all woods selling in northern coast markets. The hardwoods are benefiting from the gradual opening up of industrial activity. There is a slow but steady increase in the demand, and this has been coupled with a

View of Mills in Sarnia.

# BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

conservative policy on the part of hardwood purchasers and dealers, so that the situation is encouraging. Many factories in New England are running at full capacity on orders definitely connected with the war, and are calling for a large amount of boxing and crating material of excellent grade. The building trade in the cities is quiet. In general, the lumber market is gradually showing improvement as to volume, although prices show little or no alteration. In the east alone, prices have been stiffening. Apparently the trade is waiting in the hope that a better demand will develop as the season advancs.

# Market Correspondence

**SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD**

## Better Trade Outlook at Ottawa

Ottawa, April 7th (Special to the Canada Lumberman):—There is an increased feeling of optimism among lumbermen in Ottawa and district in regard to the trade outlook for the coming season. It is coming to be generally recognized that business must go on in spite of the war, and consequently money is loosening up a little. The movement to the United States is improving from week to week, and some of the leading lumbermen here say that they have reason to believe that the recent imposition of a 7½ per cent. increase in the customs tariff on lumber coming into Canada, has helped local trade to some extent. Medium and low grades are in most demand from the country to the south, but some purchases are being made in high grades, too. Prices still remain unaltered.

Last week Parliament ratified the expenditure of $100,000,000 for war purposes. The Militia Department will spend over $95,000,000 of this amount and the Naval Department, over $3,000,000. Most of the latter sum will be expended in improving naval yards and in shipbuilding.

At the annual meeting of the Ottawa Fire Protection Association it was decided to ask Premier Hearst to hasten the appointment of a fire marshal for Ontario under the terms of an Act passed last session. The new officers elected included many prominent lumbermen in the city, among them being the following: President, Senator W. C. Edwards; vice-presidents, C. Jackson Booth, Sir Henry Egan and Clifford Sifton; directors, Gordon Edwards, Denis Murphy, J. R. Booth, Frank Hawkins, J. F. Booth, and R. H. Campbell.

Captain John L. Murphy, one of the best known lumbermen in the Ottawa Valley, died recently at Riverside, California, in his 77th year. He was born in Aylmer, Que., and for over fifty years was identified with the transportation of lumber on the Upper Ottawa, owning a fleet of barges that plied between Aylmer and Des Joachims. He was also head of the Upper Ottawa Towing Company, a large shareholder in the Bank of Ottawa, director of the Toronto General Trust Company and prominently identified with a number of other corporations. He went to Riverside, three weeks before his death, to spend a vacation on his orange grove there. His death was due to pneumonia following a cold.

## Montreal Shippers Securing More Vessel Space

Montreal, April 12th (Special to the Canada Lumberman):—No change of any importance in trade conditions is to be reported. Trade is rather slow, the retailers doing little in the absence of any revival in the building line. Some of the wholesalers are looking for a more pronounced demand from the province of Quebec (outside of the cities) where there are many new buildings, especially churches and schools, projected. General conditions in the province are fairly good, and are relatively better than in the cities. The Montreal building permits are a sufficient indication of the state of the local contracting business. During last month the value was $246,695, a decrease of $603,231, as compared with the corresponding period in 1914; for the first three months of the year the total was $891,936 a decline of $975,911, compared with the first quarter of 1914.

The sash and door factories are quiet. One of the largest box factories in the city is very busy on a good order for ammunition boxes, and this is likely to continue for some time.

The recent failure of a prominent contractor which affected two or three lumber firms is likely to turn out better than was at first expected, and it is probable that at least 75c on the dollar will be paid.

A very large quantity of spruce has been purchased for the British market, and a considerable amount of steamship room has been secured, at rates varying from 100s. to 125s. per standard, according to port. The problem will be to obtain space for all the freight which will be on offer, and it may be that tramp steamers will be attracted to the port on account of the high rates which will prevail. Should the mail service not resume its normal schedule, there is a chance that the principal exporters may charter one or more tramps, for the purpose of carrying full cargoes of lumber. An enormous quantity of lumber, principally spruce, is being manufactured for the United Kingdom, and clearly lumbermen are looking to that market to offset any dullness on this side.

Ground wood is easier. There has lately been plenty of water available for the United States mills, and stocks have also accumulated. Although the water is now a little lower, the spring rains will again fill the streams, so that the market for ground wood is not likely to improve just yet.

Exports of chemical pulp from Europe to the United States are on a smaller scale. Advices from England state that the price there has risen about a dollar per ton, due to higher freight charges. European mills are asking increased prices for shipments to the United States, chiefly owing to the higher cost of coal and other raw materials. The consumption of sulphite pulp in Canada and the United States has not been up to normal since December, and it is probable that had the consumption been on the usual basis there would have been a shortage in the available pulp, owing to the decline in European supplies.

Canadian and United States newsprint mills are fully employed.

## Boston Market Report

Editor Canada Lumberman:— Boston, Mass., March 26.

There is little change in prices at Boston. New Brunswick cedar shingles are weak and have been sold as low as $3.30 for extras and $2.75 for clears. Spruce dimension lumber is rather scarce in this market at the present time—i.e., the Maine product, not the Canadian. Regular schedules are now $24 firm, and are likely to advance a little more very soon. This is largely on account of the small number of mills operating at the present time, it being between seasons. Random spruce is possibly a shade firmer, but not much different. Canadian spruce boards seem to be rather weak. White pine is unchanged.—Shepard & Morse Lumber Company.

## Barbabos Market Report

S. P. Musson, Son & Company, Barbados, report under date of March 19th, as follows:—Lumberstuffs—White pine—There have been no arrivals during the fortnight, and stocks are not heavy. First receipts should do well, and we would value the same at around $34 and $26 duty paid respectively, for merchantable and second quality. Spruce—The Schr. "Mina German" has arrived from Belliveau Cove with a cargo of 150 M. which was sold to arrive at $26 per M. for shippers. The market is heavily stocked, and further shipments are known to be on the way. Shingles—There is no improvement in the position. Stocks are heavy, and there is no enquiry to speak of. Shooks—We note the arrival of 400 bundles on importer's account. Wood hoops—No arrivals.

## Spruce Deals in Great Britain

The Timber Trades Journal, referring to spruce deals, in its issue of March 27th, says:—"There is no particular change with regard to c.i.f. values, the position at the West Coast ports remaining as it was, solely a matter of freight. F.o.b. values keep firm, and there is very little likelihood of any decline. So far as freights are concerned, they are stiffening daily, and 130s. per standard St. John to West Britain is quite common; in fact, this figure has, we believe, been refused. There is a fair amount of stuff being offered, but practically all on a basis of freight, which is, to say the least of it, most misleading. For instance, £9 f.o.b. sounds a reasonable price for 3 x 7 in. on to-day's current spot quotation of £16 10s., based on a 90s. rate of freight; but if there has to be another 40s. added to that for freight, it indicates that there is something wrong somewhere, as there has to be added to the f.o.b. cost and freight, not only war insurance, but landing charges as well, to get the actual cost ex quay, and certainly to-day's quotations for 3 x 7 in. do not leave the importer a working margin of profit, so that, in our opinion, spot values are bound to increase. At the present time spot quotations are certainly very firm, but there is almost an entire absence of speculative buying on behalf of the consumer, so that sales for forward delivery are apparently difficult to make; but at the same time it must be realized that goods

# Getting Acquainted

Is somewhat of a problem, at times, occasionally decidedly unpleasant You have probably found it so in both your buying and selling experience.

Why take a chance of having your pride, feelings or temper ruffled—stick close to your old friends, not quite the excitement maybe, but there's that peace of mind, that satisfaction in knowing that they can be depended upon.

There is no more dependable place on earth to get your Dressed Spruce, than Fenderson's—the value is in it—beautifully dressed—excellent grade—bone dry—you can bank on its being good when you place the order.

If you would help your business grow, handle better stock than the other fellow, your customers talk it over, if pleased, they build your business—if not pleased, they tear it down. Be jealously careful of your strongest advertising medium.

## Remember

The most value for every dollar.

Each car chuck full of satisfaction.

Make that next car a Fenderson car.

You'll like it.

## John Fenderson & Co.

Incorporated

Sales Office

Jacquet River, N. B.

**WE CARRY THE LARGEST AND BEST ASSORTMENT OF DRY SPRUCE IN CANADA**

arriving are all more or less going direct into consumption, so that not only are available supplies insufficient to meet current requirements, but stocks are being still further reduced. The consumptive demand, taking it all round, is not too brisk, and consumers are only buying for what they actually require, and their requirements are not difficult to fill. The outlook for the next few months is somewhat obscure, but we venture to think that any goods that come forward will be fairly easily disposed of, even at considerably higher values than are quoted to-day. It is only reasonable to suppose that consumers will not buy ahead for imaginary requirements, but when they want the goods they will be quite prepared, and in most cases realize that they will have to pay more."

## Columbian Pine at Yarmouth

A despatch from Yarmouth, Eng., of recent date ,says:—The most important event at Yarmouth during the past week has been the arrival of the fully-rigged French ship, "Thiers," the largest sailer that has yet visited that port, and a splendid model of what a "three-sticker" should be. Her dimensions dwarf everything else in the harbor, and yet, viewed from the quayside, one gets no real idea of her size, owing to her excellently proportioned lines. The "Thiers," which belongs to Nantes, and has a steel hull, brings the first cargo of wood imported into Yarmouth in 1915, a fact upon which the merchants, Jewson & Sons, who are receiving from the depths of her three holds over a thousand loads, are to be congratulated. Just now, when supplies are cut off from Russia, Sweden, Finland, and, of course, Germany, wood is wood indeed, since no one can tell when another cargo will arrive. Not only is the ship notable as belonging to a type once common, but whose day is inevitably passing, but her cargo is distinctly worthy also. It has been brought over 15,000 miles to eastern counties' consumers, the longest journey any wood has yet made to Yarmouth. It was loaded at deep water jetties at Seattle, and was cut in the wonderful virgin forests of British Columbia, where trees run up as straight and true as a shaft for 300 feet and more.

The wood from these forests, cut from such giants, naturally runs to lengths and widths quite impossible to obtain in European countries. The mills where these logs are converted have in recent years been fitted with up-to-date plant, and Columbian pine now comes to England thoroughly well manufactured. The wood has a reddish tinge, and displays as beautiful a figure as many costly cabinet woods. It has not the resinous nature of pitch pine, but as a general utility wood occupies a place of usefulness that is entirely its own, especially for joinery and cabinet work. The widths in which Columbian pine can be obtained show a considerable range, and in planks it runs to large dimensions. This is not the first cargo of Columbian pine imported into Yarmouth, as some time since Jewson & Sons landed a shipment brought by another big sailer, the "Cissie." The present cargo is being stacked away, as landed, under cover, Messrs. Jewsons having now shedded all their yards, so that wood is kept in the best possible condition, and not exposed to the weather.

The "Thiers," which belongs to a well-known French company, was six months making the passage from Seattle, which she left on May 19th, to the Channel, and she put into Southampton on November 27th. Her master, Captain Lebeau, first heard of the war on September 7th, when coming home with the "trades" through the South Atlantic, but nothing was seen of any German cruisers, and the "Thiers" made her passage safely till she was in touch with the patrols of the Allied fleets.

## Riordon Company Make Good Annual Report

Montreal, April 12th (Special to the Canada Lumberman):—The good prices obtained for pulp during the early part of last year are reflected in the annual report of the Riordon Pulp and Paper Company, presented to the shareholders at the annual meeting held in Montreal on April 7. The statement shows gross profits of $375,862, out of which $65,951 was taken for depreciation and reserve, and $62,832 for interest paid during the year, leaving the net profits of the year at $247,078, an increase of $19,005 over the preceding year. After bond interest of $90,000 and preferred dividends of $70,000, the surplus balance was $244,380, or $87,079 higher than the preceding year. The president, Mr. Charles Riordon, in his report, stated: "Your directors have much pleasure in making the above report, as naturally business has been very much unsettled owing to the war. During the early part of the war the price of pulp advanced materially, but during the last few months the demand has fallen off and prices are lower. We anticipate, however, an improving demand for the company's product during 1915, and hope to make as good a showing for the coming year."

The board was re-elected as follows: President, Mr. Charles Riordon, St. Catharines, Ont.; vice-president and managing director, Mr. Carl Riordon, Montreal; directors, Messrs. J. G. Riordon, F. W. Avery. C. E. Read, W. G. White, and S. B. Pemberton.

## Possibilities of Hardwood Distillation

Valuable information on hardwood distillation was furnished at a recent meeting of the American Institute of Chemical Engineers in an elaborate paper by Edward H. French and James R. Withrow. From historical data gathered by these men it seems that among the pioneer efforts at distillation was what was known as the Scotch Works, built in 1852 by the Turnbull Company of Glasgow, Scotland, the location of this plant being known at that time as Milburn, N. Y. Quite a number of plants were developed along the methods followed by the Scotch Works, using cylinders for distillation and producing mainly acetate of lime. An interesting story is furnished of the early efforts and the gradual development of the industry. The matter of prime interest to the hardwood lumber fraternity today, however, is not so much the history of what has been done as the possibilities of what may be done, the methods followed, the cost of the work, and the possibilities in the way of returns.

In the matter of production cost and value Messrs. French and Withrow have covered the matter in detail and have tabulated production cost results as follows:

| | |
|---|---|
| Fuel | $1.15 |
| Labor | 1.25 |
| Lime | .18 |
| Bags | .14 |
| Freight (acetate) | .35 |
| Freight (alcohol) | .10 |
| Selling Commission (acetate) | .11 |
| Insurance, per cord | .068 |
| Taxes, per cord | .112 |
| General expense | .57 |
| Total (operating expenses) | $3.85 |

They take $5 as an average or maximum wood value, which makes a total cost per cord of $8.85.

Compared with this they show a production value as follows:

| | |
|---|---|
| Alcohol (82 per cent.), 11 gal. at 25 cents | $2.75 |
| Acetate of lime, 216 lbs. at $1.75 | 3.78 |
| Charcoal, 52 bu., net 6¼ cents | 3.38 |
| Total crude value | $9.91 |

To quote from the paper in question: "This gives a production cost of $8.85 and a sales value of $9.91 per cord. It will be noted that no selling costs, except in the case of acetate of lime, have been included because in the works not refining or making the finished product, which are in number far in excess of those who do refine, the alcohol is sold under contract to the refiner and the charcoal as in the case of those plants in the lake district is either consumed at iron furnaces in connection with the plants, or, as in the eastern field, handled by a general sales agency controlled by the manufacturers."

The production costs in this case are based on what is called the eastern field, which, it is pointed out, gives a higher production than the lake district. They figure, however, that this discrepancy is compensated for by the fuel cost which is lower in the lake region where mill waste is available. There is room for inquiry here. Examination should be made into the subject of the relation of capacity to cost in the distilling plant, and the size or capacity of equipment necessary to get an average or minimum cost be determined. The relation of the size of the equipment to get efficiency to the possible supply of raw material that might be available in the form of waste wood must also be taken into consideration.

Leaving out the cost of wood supply and equipment necessary to secure it regularly, it is estimated that the value of the equipment necessary for hardwood distillation will run approximately $2,000 per cord per day of production. For instance, Mr. French says, that the cost of boiler, oven, cars, coolers, pumps, etc., is about $650; copper work, including stills, condensers, piping, etc., approximately $450, and brick work for ovens and boiler settings about $190. These three general items would of course vary a little with location and other local conditions. However, the general figure of $2,000 for equipment per cord, per day production is a reasonable estimate, though, of course, this cost might be varied more or less in equipping a plant, depending on the equipment, methods followed, and the extent to which the work of producing and refining is carried.

One of the interesting features of the treatment of the subject of hardwood distillation in the paper referred to is in the tabulation of the extent and distribution of hardwood distilling plants in the United States at the present time. This is as follows:

| | | | |
|---|---|---|---|
| Michigan | 8 | oven plants carbonizing | 1,032 cords daily |
| | 5 | kiln plants carbonizing | 1,050 cords daily or |
| | 13 | plants carbonizing | 2,082 cords daily |
| Pennsylvania | 33 | oven plants carbonizing | 1,424 cords daily |
| | 13 | retort plants carbonizing | 215 cords daily or |
| | 46 | plants carbonizing | 1,639 cords daily |
| New York | 7 | oven plants carbonizing | 256 cords daily |
| | 17 | retort plants carbonizing | 362 cords daily or |
| | 24 | plants carbonizing | 618 cords daily |
| Wisconsin | 2 | oven plants carbonizing | 96 cords daily |

# CAMP SUPPLIES

Many lines of food supplies have advanced materially during the past few months. To offset this advance we have some specials which you may be able to use to good advantage in the camps.

| | |
|---|---|
| Natural Figs, Extra Fine Quality, Bags 30 lb. | 5¾ |
| Dried Peaches, 50 lb. Boxes | 4¾ |
| Sair Dates, Boxes about 60 lbs. | 3½ |
| Prunes 70/80, Boxes 50 lb. | 7¾ |
| Evaporated Apples, Boxes 50 lb. | 7¾ |
| Gallon Apples | 2.10 |
| Gallon Rhubarb | 1.65 doz. |

## Standard Chain Company

**Pittsburgh**

| | | |
|---|---|---|
| | 1 oven-kiln plant carbonizing ... . | 250 cords daily or |
| | 3 plants carbonizing ... ... ... ... | 346 cords daily |
| Kentucky ..... | 1 oven plant carbonizing ... ... ... | 20 cords daily |
| West Virginia .... | 1 oven plant carbonizing ... ... ... | 49 cords daily |
| Tennessee..... | 1 oven plant carbonizing ... ... ... | 32 cords daily |
| Vermont..... | 1 retor plant carbonizing ... ... ... | 16 cords daily |

This makes a daily capacity of 2,909 cords in 53 oven plants or a total of 4,802 in 90 plants. In Canada there are 9 oven plants charring 424 cords daily and one retort plant charring 48 cords, or a total of 472 cords in 10 plants. This makes a total for America of 5,274 cords per day in 100 plants.

This elaborate review of the hardwood distilling industry in America takes note among other things of efforts made in 1903 by a well-known lumber concern at Cincinnati to distill sawdust continuously by means of an endless belt carrying the sawdust through an oven. Mr. French says that it can be seen readily that sawdust cannot be destructively distilled in bulk because the insulating space between the particles prevents the heat from going through the mass. That was the reason for the endless belt. The pretentious effort along this line mentioned did not prove profitable, but it does not mean that some efforts may not prove successful, for it takes time and failures as well as experiments to develop an industry of this kind.

Hardwood distillation, especially distillation of the waste products of various kinds of the hardwood sawmill is a matter that seems to have reached the point where we can get down to real business and hope for actual returns, and it is therefore a subject which the large operators in the hardwood territory should study closely—not consider it as merely something distant and apart from them. It has possibilities in the way of personal returns and more profit out of hardwood holdings.

## Disston' Panama Exhibit

Henry Disston & Sons, Incorporated, saw and saw tool manufacturers, Philadelphia, Pa., recognizing the importance and value of the Panama-Pacific International Exposition, were among the first to apply for space in the Palace of Manufactures, with the purpose of making an exhibit. Their display, now installed in a fine corner location on the central aisle, Palace of Manufactures, indicates that they have successfully carried out their intention with credit to themselves and to the Exposition. The exhibit appropriately commemorates the seventy-fifth year of the house of Disston in the business of manufacturing good saws—1915 is therefore the Disston diamond jubilee.

There are few industries that do not use the Disston products in some form. Most people will be keenly interested in the tool and saw display, and will be amply repaid in visiting the Disston booth several times, as, like the Exposition itself, its beauty, elaborate detail, scope and mechanical effects are too great to be fully appreciated in one visit.

A cordial invitation is extended to all by Henry Disston & Sons to visit this exhibit at the intersection of Avenue C and Sixth Street, Palace of Manufacturers, Panama-Pacific International Exposition, at San Francisco.

## Slipping Belts

What does it profit an engineer if he has the right kind of boiler, the right kind of grates, the right kind of stokers, the right kind of draft, the right kind of engine and the right kind of belting; and—then loses approximately thirty per cent. of his driving power by belts slipping? When something is wrong with the drive, let's fix the drive. The belt is all right, or at least it was all right before the fibre of the leather pulled off by dry rot, caused by tight tension and friction due to running on a smooth pulley face. The less the tension can be made within reasonable limits without causing slipping, the longer will be the working life of the belt. Belt manufacturers tell us the same thing, and it is claimed by the best practice that neatsfoot and castor oil is the best and the only food or lubricant for leather belts.

Its use means pliability, which overcomes a part of this friction.

By the knowledge of belt manufacturers, it is an absolute fact that belt burning is caused by slipping, which results in cracking, breaking, and loss of time and money. This trouble is prevalent particularly in refrigerating plants, where the drives are short and heavy.

The chief engineer of the Wright's Health Underwear Company, Troy, N.Y., states in his report to the president of this company that he has eliminated this trouble by using "Gripwell" Pulley Covering, manufactured by the "Gripwell" Pulley Covering Company, 601 Candler Building, New York City.

This is an oil and cement compound applied in conjunction with a specially prepared canvas to the pulley face. It acts as a lubricant to the belt and at the same time gives the pulley a leather-like surface of the same nature as the belt.

It is claimed for this pulley covering that it permanently stops all slipping, thereby increasing the life of the belts, of the bearings and the machinery, and adding to the efficiency of the power plant.

Exhibit of Henry Disston & Sons, Incorporated, at the Panama-Pacific International Exposition at San Francisco.

## Hardinge Watchman's Clock

70 per cent. of the lumber fires start in the yards. Is it not good business to employ a night watchman and a Hardinge clock?
Stations at the end of each alley—weatherproof, tamperproof, and put up by your own men, no wiring, guaranteed by the factory for one year. Every danger point in your plant is inspected hourly every night and you have your watchman's record of his night's work.
No part of this clock is made in Germany—it is made in the United States. The clock is $39.50 and stations $4.20 each, F.O.B. Toronto. The Canadian Western Lumber Co., New Westminster, B.C., have 40 stations in their plant.

## Ontario

W. P. Ball, Thorold, Ont., has commenced work on the erection of a furniture factory to be 1½ storeys high, 25 x 50 ft., frame construction.

The Kemp Furniture Company, Amherstburg, Ont., are contemplating the erection of an addition to their factory at a cost of $3,000. The building will be two storeys, 28 x 38 ft.

E. W. Near, Limited, has been incorporated with head office at Ridgeway, Ont., to take over the mill and lumber business of E. W. Near. The provisional directors of the company are E. W. Near, I. L. Round, G. B. Snyder, C. A. Larkin and M. V. Visher. The capital stock of the company is $30,000.

The Canadian Fibre Board Company, Limited, have been incorporated with head office at London, Ont., and capital stock of $40,000. The provisional directors are W. Buchanan, J. S. Ferguson, E. Buchanan, C. W. Coles and R. G. Ivey. The company is given power to purchase, manufacture and sell all kinds of building material.

The Canadian Wall Board Company, Limited, has been incorporated with head office at Toronto and capital stock of $50,000, to manufacture, buy and sell wood fibre, pulpwood, wood pulp, either mechanically or chemically prepared, paper and other articles. The incorporators include H. Riley, W. B. Sturrup, T. S. H. Giles and W. C. H. Swinburne, all of Toronto.

The Ontario Pulp & Paper Makers Safety Association has been incorporated with head office at Toronto to promote the prevention of accidents in pulp and paper mills and other industries assessable by the Workmen's Compensation Board of Ontario in the same insurance group as pulp and paper mills. The provisional directors of the corporation are W. P. Gundy, I. H. Weldon, Carl Riordon, C. H. Le P. Jones and H. R. Erskine.

C. C. Ruggles, head of the South Coast and Northern Lumber Company, Saranac Lake, N.Y., recently visited Midland, Ont., and closed a deal with Manley-Chew for a large block of white pine lumber. Through this deal the South Coast and Northern Lumber Company has a stock of over 15,000,000 feet of dry lumber to draw on. The stock is cut in full thickness in lengths 10 to 16 feet, more than fifty per cent. of the lot being 16; the widths are all piled separately and run from 4 to 20 inches, with a good assortment of all grades from uppers to No. 2 box.

S. Anglin & Company, Kingston, Ont., who recently lost their sawmill and planing mill by fire have commenced work upon rebuilding their sawmill, and when it is completed they intend to rebuild the planing mill. The sawmill is to be a one-storey building, 25 ft. x 105 ft. It will be a metal clad, wooden structure of slow burning mill construction type, the floor consisting of 2 x 4 scantling laid on edge, which makes a heavy, rigid floor, suitable for any machinery. They are installing a 40 h.p. Waterous high speed engine, and a Waterous saw frame to take a 60-in. circular saw, which is intended for cutting all kinds of logs, timber and lumber. The fire which destroyed their former plant occurred on February 16th. The company hope to have their new saw mill in running order by April 15th.

## Eastern Canada

The Eagle Lumber Company have started up their new planing mill at St. Jerome, P. Q. The company have also a sawmill at St. Jerome and one at Mont Laurier.

Good progress is reported upon the erection of the sash and door factory belonging to Lebel & Fergues Company, Limited, 97 Van Horne Avenue, Montreal, P.Q. The plant is to cost $5,000.

M. T. Schurman & Company, Summerside, P. E. I., will commence work upon the erection of their sash and door factory on May 1st. The machinery has been ordered. The plant is to cost $5,000.

The Victoria Mills, owned by Fraser Limited, Fredericton, N.B., commenced sawing operations on April 5th. It is expected that the cut of the mills will be between 12,000,000 and 15,000,000 feet this season.

Walter Brown, Beebe Junction, P.Q., is contemplating the erection of a sash and door factory to cost $5,000, at Beebe. The building will take the place of the one which was recently destroyed by fire. Work will be commenced in the near future.

Before the Corporations Committee of the New Brunswick Legislature the South West Miramichi Boom Company's bill recently asked for the extension of their charter for twenty years from 1920, but the committee recommended an extension of only five years, or until 1925, instead of 1940. The company's application for an increase of 10 cents per thousand feet for rafting was refused by the committee, and a recommendation has been decided upon to bring the company in future under the regulations of the Public Utilities Commission.

There was a very large attendance at the sale by auction on March 30, of the effects of Lucien Morin (Morin Freres), lumber merchant, 2710 St. Lawrence Boulevard, Montreal. The sale was by order of the Court. The stock of lumber, valued at $15,991, was sold for 65c. on the dollar to the St. Lawrence Lumber Company, Montreal, after some very brisk bidding; the same company purchased the rolling stock at 37c. on the dollar. The book debts of $31,207 were sold for 6 cents on the dollar. Six shares of $100 each in the Canada Lumber Sales Company, Limited, fetched $191. The mill and lumber yard property, covering about 24,000 feet, and including a two-storey brick encased mill and machinery, was withdrawn at $31,000. A number of shares in various land companies, valued at $7,500, brought low prices.

## Western Canada

The Canadian North American Lumber Company, Limited, Winnipeg, Man., have decided to transfer their head office from Winnipeg to Vancouver

in the near future. The company recently took over the plant of the Converse-Brown Shingle Company, Limited, at Sidney, Vancouver Island.

The plant of the Canadian Puget Sound Lumber Company, Limited, Victoria, B.C., recently resumed cutting operations on a six-hour-a-day schedule.

F. J. Carpenter & Company, Limited, Yorkton, Sask., have been incorporated.

T. H. Adams, who some time ago purchased the Stone Lumber Company sawmill in Duncan district, Vancouver Island, is preparing to start up the plant.

The Empire Lumber Company have reopened their logging camps at Cowichan Lake, Vancouver Island, and have resumed the shipment of timber to Genoa Bay.

Tomlinson & Mitchell, wholesale lumbermen, Winnipeg, Man., and Vancouver, B.C., have opened an office in Minneapolis, in charge of H. H. Hoover, who formerly represented the firm in that territory.

The cutting of ties still continues to give good business to a number of British Columbia plants. The M. B. King Lumber Company, which has a mill at King's Siding, not far from Vancouver, is among the lucky ones.

Sealed tenders are being received by the Minister of Lands of British Columbia up to May 16th for the purchase of license X392 to cut 2,548,000 feet of fir and hemlock on lot 29, Beaver Creek, Loughborough Inlet, Range 1, Coast District. Two years will be allowed for removal of the timber.

Noel Humphrey & Company, Limited, have been incorporated in British Columbia with head office at Vancouver, and capital stock of $10,000, to carry on business as locators, cruisers and surveyors of timber, mineral and other lands.

The Comox Logging & Railway Company, Limited, a subsidiary company of the Canadian Western Lumber Company, Limited, Fraser Mills, B.C., recently opened up two of its four camps in the Courtney district, Vancouver Island.

Sealed tenders are being received by the Minister of Lands for British Columbia up to May 16th for the purchase of License X16 to cut 3,649,000 feet of fir, cedar and hemlock on Lot 24 Thurlow Island, Mayne Channel, Range 1, Coast District. Two years will be allowed for removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia up to May 4th for the purchase of license X224 to cut 3,072,349 feet of Douglas fir, red cedar and hemlock, on an area adjoining S. T. L. 2892 P, Princess Royal Reach, Jervis Inlet, New Westminster district. Two years will be allowed for removal of the timber.

The Shull Shingle Mill Company, who are building a large mill on the north arm of the Fraser River in Burnaby, B.C., report that the construction of the plant is progressing satisfactorily and that they expect to open it by June 1st. This will be one of the largest shingle mills on the coast and will give employment to from eighty to one hundred men.

A report from Port Alberni, B.C., states that the plant of the Canadian Pacific Lumber Company is resuming operations. This will doubtless bring into action the camp of the Weist Logging Company, which has supplied logs to that saw mill in the past. It is reported also that lumber business conditions, if not particularly improved, are at least very encouraging. If carriers can be secured, material betterment will at once take place.

Chief Justice Hunter has refused to grant an order for foreclosure in the matter of certain timber limits held in the name of Alvo von Alvensleben and the Alvo von Alvensleben Company, of Vancouver, B.C., made by J. G. Fordham, who has a first mortgage of $20,000 at five per cent. against the property. The Franco-Canadian Corporation has advanced $71,000 as a second charge against the timber leases, and all the directors of the company are at the front in Europe. Such a satisfactory offer was made on their behalf that the judge extended the foreclosure order for six months, with the promise of a further six months' delay if the offer is lived up to.

W. Allen and F. King, of Bellingham, Wash., have about completed their plans for the erection of a shingle plant of fair size on the waterfront at West Vancouver, on the north shore of Burrard Inlet. The site secured is distant about a block from the old wharf at Hollyburn landing. Messrs. Allen and King control extensive cedar limits on the upper benches of the mountains back of West Vancouver; these will be tapped by means of a log flume about two miles in length, which will deliver the bolts direct to the mill. Water for the operation of the flume will be supplied by a dam 182 ft. in width and 16 ft. high, to be put in at an elevation of 1,138 ft. Some delay has occurred in securing the necessary water rights from the Government, but it is likely a start will soon be made on construction.

Articles of incorporation were filed recently with the county clerk at Portland, Ore., by the International Hardwood Company, by S. E. McCallum, of Victoria, B.C.; D. J. McCallum and C. E. Moore, with a capital stock of $25,000. The company plans to import in large quantities to Portland birch and maple timber from Eastern Canada where the McCallums are interested in large bodies of timber in which they have now started operations. The company here has already orders for 2,000,000 feet of material that will figure largely in the manufacture of furniture. The material will be brought here in steamers via the Panama Canal. John McCallum, father of S. E. and D. J. McCallum, is interested in a large way in hardwood timber in Eastern Canada. A mill will probably be installed here to resaw the timber upon arrival.

---

The annual meeting of the Upper Southwest Miramichi Log Driving Company, was held at the office of McLellan & Hughes in Fredericton, N. B., recently. J. W. Brankley, of Chatham, was elected president; R. W. McLellan, of Fredericton, secretary; W. P. Eaton, Fredericton, treasurer. The directors are J. W. Brankley and James Robinson, of Millerton; H. D. Freese, of Boisetown, and Guy Welch, of Bristol. The meeting of the Southwest River Driving Company was held on the same day, and the following directors were chosen: J. W. Brankley, James Robinson, H. D. Freese, Guy Welch and R. W. McLellan. Mr. Brankley was chosen president, R. W. McLellan, secretary and W. P. Eaton, treasurer.

## Lumber in Porch Work

Quite an important part of the material business of every building season is made up of porch work. There are porches for the new buildings and many porches added to old buildings, so that with it all for several years now porch work has been an important part, much more important than previously, of the building material business. It includes front porches and, as a conspicuous item, sleeping porches, and often, with the co-operation of an enterprising lot of carpenters and builders, much more porch work can be stimulated than is naturally done.

The porches of to-day are much simpler in outline and generally more massive in appearance and construction than they were a decade ago. Much of the old scroll and bracket work and ball and rod work has disappeared. There has come lately some scroll lines in exposed parts of roof construction which is a development of the bungalow type of architecture, but, taking the business as a whole, there is not much gingerbread any more, and as a rule it is either heavy round columns or square columns and extending cornices.

Another change that has come in this era of porch building is in the tendency to use concrete extensively in porch construction. In this, as in every new idea, there is a tendency while the idea is new and popular to carry it to extremes, which will result eventually in some reaction. There is really room for much more use of wood in porch construction and better satisfaction to be derived from it.

Arguments that have been heard about the relative cost of concrete and wood in porch construction have led to some investigation of the subject, which brings out some remarkable contrasts in the cost of porch construction that should not exist.

In one locality, for example, where cypress, pine and oak flooring were available, it was found that common oak flooring of short mixed lengths could be had for less than half the price of special cypress porch flooring. It was because those using the cypress had developed the practice of buying stated, uniform lengths and somewhat thicker stock.

When we take some of these higher prices of special porch flooring it may be often found that in first cost it is practically as cheap to build a porch floor of cement.

Another peculiar fact developed in this connection is that the oak flooring folks themselves have never exploited their flooring extensively for porch work. This seems odd in view of the fact that narrow oak flooring makes the best kind of a porch. This is not a matter of guesswork with the writer, but is a demonstrated fact that is supported by about a thousand feet of oak porch flooring on the writer's own home. It is No. 1 common 1½-inch face and it makes a splendid floor that costs less than half the price charged for some special porch flooring.

The oak flooring folks are more concerned with exploiting the higher-grade, higher-priced flooring as an artistic proposition and seem to have some apprehension that the use of common stock painted on the porch floors will detract from the value and appreciation of oak as the ideal material for the finest floors. This, in the writer's opinion, is a mistaken idea, and it is just as important to exploit porch floorings as it is hardwood floorings for factories.

This is not specifically an exploitation of oak, but rather a desire to present some good ideas about wooden floors for porches, ideas taken from actual experience. Where thick common oak stock is available in narrow strips this is, in the writer's opinion, the best porch floor that can be had. However, splendid floors can be made from pine, fir, cypress or any of the woods that will stand service and exposure when painted. The best results for the least money in either case may be secured by using narrow stock in mixed lengths. Of course, it is ideal to have all single-length pieces in the floor, but it is an expense which does not justify itself. The main thing to get a good floor is to use narrow strips, preferably not wider than two inches, and it is the writer's opinion from experience that 1½-inch face is better. Stock of this kind either end matched or joined over a joist will make just as good a floor as full-length stock.

The competition in porch material between concrete and wood does not end with the floor, though the floor is an important consideration, but extends even to the columns. The offerings in columns now include concrete columns, metal columns and brick piers are entering considerably, too. Strange as it may seem, too, some of these are offered to the consumer cheaper than wood.

The only explanation found for this is that somehow the retailers are often asking more than they ought for wooden columns, or else it is costing more to manufacture them than it should. It should be practical to manufacture a wooden column cheaper than any of the competitive offerings. We have machines and methods that will do this, and those who are following long, tedious processes for manufacturing columns need to take a few kinks out of their system and shorten up their process.

Wood work is more attractive in a porch than concrete and brick, just as it is more attractive in the interior of the home, and with the present widespread tendency to sleep in the open air and to make the sleeping porch a part of every home there should be a better chance than ever before to push the wood products in competition with others, because certainly a sleeping porch with a wooden floor and constructed largely of wood is more desirable and attractive than one of cold concrete or of metal. There is a chance in porch work to do a lot of good exploiting of wood products that will help make a profit for the lumber retailer and the local planing mill man and to make more satisfactory homes for the people.

### Nail Collars

The man who thinks a nail is just a nail, has another think coming, because things happen even to plain nails, and one of the latest happenings of this kind is putting a collor on the nail. Something like a year ago there was described for the retailers a type of wire nail with an extra head on it for temporary and form work which would make it easy to draw out. Now there is a new wrinkle for this same purpose in the form of a nail collar made in various sizes which is bought separate from the nails, and through which the nail is slipped before driving for doing temporary and form work—the idea being that the collar will serve the purpose of clamping the work tight and, at the same time, leave the head of the nail projecting for taking down the temporary work. The nail collar with the nail inserted and driven home has a suggestive resemblance to the familiar collar button of masculine attire, and it is made in three sizes, the smaller to fit 4, 5, 6, 8, 10d. common wire nails, the medium to fit 10, 12, 16, 20's, and the large size to fit 30, 40, 50 and 60's wire nails.

## Romance of the Timber Trade

James Lawler, Honorary Secretary of the Canadian Forestry Association, delivered a lecture recently in the assembly hall of the Carnegie Library, Ottawa, on the subject "The Romantic History of the Canadian Timber Trade."

He began by saying that the subject was so big he could touch only the high spots. In Canada the lumber industry had come second in point of time and was now second in importance, from which point it ought never to recede, considering the large proportion of the land of Canada which was fit only to grow trees, unless Canadians were criminally careless of their great forest heritage.

By means of lantern slides he reviewed the history in an interesting way. He began with the old French governors, followed by the first British governors after Canada had been ceded to Britain, and he pointed out that the first efforts to exploit and to conserve the timber wealth of Canada were made by these men for the purpose of securing timber to build the Royal Navies of France and of England.

The first timber regulations were made through the seigniors, those old nobles to whom the land of New France was parcelled out in order that the feudal institutions of the old land might be copied in the new. After the cession to Britain these seigniors were confirmed in the possession of their lands but were no longer entitled to the appellation "Sir." One of these seigniories he described in particular, that of Lotbiniere, which has been in the possession of the same family since 1655, and which was the first timber holding to be handled by the family owning it in a modern way as to conservation. Sir Henry Joly de Lotbiniere (he was knighted by Queen Victoria for distinguished parliamentary services) was the man who began practicing forestry on this estate, of which the timber part amounts to 45,000 acres, and he was also one of the fathers of forestry in Canada, one of the founders of the Canadian Forestry Association and the first president of that association in the years 1900 and 1901.

The arrival of Philemon Wright, the pioneer of lumbering in the Ottawa Valley, from the United States in the closing years of the eighteenth century was duly chronicled and the subsequent development of the great industry indicated while later the connection of the trade with the Canadian rebellion of 1837-8 was shown.

The lecturer went at length into the rise and decline of the square timber trade of the port of Quebec, showing that in 1864 no less than 1,350 full-rigged sailing ships sailed from the port of Quebec loaded with lumber, and that the decline in this form of timber export had been rapid and steady ever since until now it had almost vanished.

The beginnings of the lumber industry in the Maritime Provinces were also dealt with, as was also the history of lumbering on the Pacific coast of Canada. In connection with the survey of the subject in Nova Scotia the lecturer pointed out as an interesting fact that historians stated that St. Paul's Episcopal Church, Halifax, was the oldest church building in Canada, though built throughout, except foundations, of wood. There were church buildings in the city of Quebec of stone of which the foundations were older than St. Paul's but their superstructures were destroyed by canon balls at the time of the siege in 1759.

A picture showing the area covered by the Miramichi fire in New Brunswick in 1825 recalled the extent of that horror when a territory 100 miles long and 25 miles wide was swept by fire in which 160 persons lost their lives, while the loss of property was enormous for that infant colony.

# Lumber and Pulp Men

You will save money in placing your orders now for your requirements for 1915 and 1916 operations. As you are aware there has been an advance in all Raw Materials equal to about 7½ % to cover War Tax. We are still in position to give you the same prices offered on January 1st.

# The Steam Tension Band Mill

It is called the steam tension mill because the tension is maintained by steam—the most sensitive form of tensioning which has been devised.

The result of this is a great saving in saws—**several users of the machine have run through an entire season without cracking a single saw.**

But in addition to raising and lowering the top wheel by steam, there is a separate cylinder for operating the top guide, and these two cylinders make ours an entirely steam-operated mill, and, therefore, exceptionally fast.

It is made with 8 ft., 9 ft. and 10 ft. wheels, and will stand thorough investigation.

Write for bulletin and list of users.

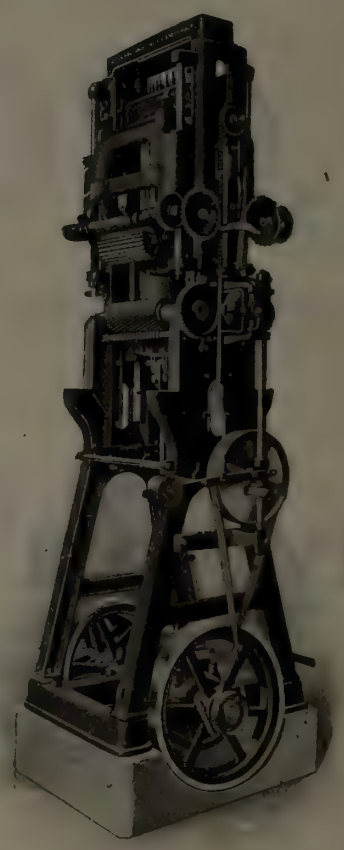
**Not altogether what we say but what users say**

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

**West & Peachey - Simcoe, Ont.**



**BOLINDERS'**

**Saw Mill and Woodworking Machinery**

meets the most exacting requirements of the up-to-date Saw Mill man.

Designed to meet the present day demand for machines capable of rapid and economical production with a minimum amount of labor.

The Bolinder line includes **High Speed Log Sawing Machines, Double Edgers, Cross Cut Saws, High Speed Flooring and Matchboarding Machines, Planing Machines, Automatic Boxboard Machines, Circular and Band Resaws, Special Patented Tonguing and Grooving Cutters, Etc.**

Ball Bearings used throughout.

On Your Direct Drives

**SCANDINAVIA BELTING**

will give you good results at a low cost.

Scandinavia Double Belting is from 30% to 40% cheaper than double leather belting and will transmit the same power.

The lasting powers of this belt on drives of this nature are enormous. We have published a book on belting which gives a lot of information on this. It is free.

**FEDERAL ENGINEERING Co**
LIMITED
TORONTO AND MONTREAL

**A FLOOD SURVIVOR**

Floods may come and floods may go, but Neptune Belting goes on for ever. Read what the owner of a large Saw Mill writes:

"We gave the 18-in. double leather Neptune waterproof belt that we purchased from you several years ago the most severe test that any belt could be given—the water was 8 feet deep in our mill, submerging the belt for ten days. I told our superintendent that we had better take the belt off before the water got to it, but he said that the belt was sold on a guarantee from the factory, and that we could try it out this time. When the water went down, all we had to do was to turn the hose on it to wash the mud and sand off it and start up. Now this belt is running our 8-foot Prescott bank mill and is running just as good as when it was new."

# ONTARIO
## *Canada's Banner Province*

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

| | |
|---|---|
| Pine production, | 905,442,000 ft. B.M. |
| Pulpwood, | 246,282 cords. |
| Railway Ties, | 5,704,459. |

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

# GOODHUE BELTING

## FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts" then you will buy a "Goodhue."

According to the conditions under which a belt has to run we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality but each made for a different service.

**Send for particulars and prices** **J. L. GOODHUE CO., LIMITED, Danville, Quebec**

# For Cutting Pulp Wood

The **Ryther Multiple Saw Slasher** will cut 1,000 logs and over per hour into absolutely Uniform Lengths — Highest Possible Efficiency — Lowest Cutting Costs, per Cord — Minimum Maintenance and Repair.

**Write for Catalogue**

The following is a partial list of Canadian plants equipped with Slashers designed and built by Ryther & Pringle Company, for other firms see future advertisements.

# Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

# Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

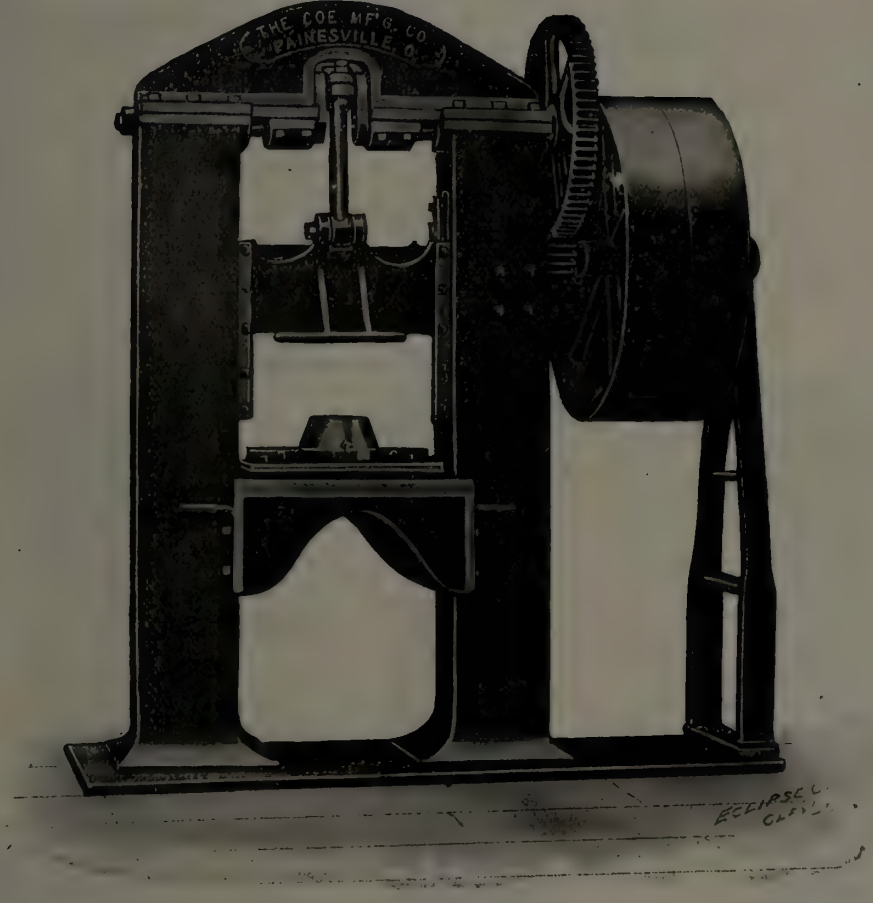
# Veneer Coe Machinery

# Hollow Die Stamping Machine

Heavy
Strong
Massive



Basket
and
Package
Dies

Style "B" Weight 4,500 pounds

This machine was especially designed for use in basket factories for making "Climax" bottoms and covers, taper peach basket staves, berry box patterns, grease and butter packages, bottoms and covers for other packages of any shape.

Its cutting capacity is from 50,000 to 400,000 pieces per day of ten hours, the output, of course, depending on the thickness of stock used.

We can equip the machine with any number of special dies to do your work. All we need are samples of the work you have to do, and we will make the dies to do it.

The machines are very heavy and strong, and with proper care will last a lifetime.

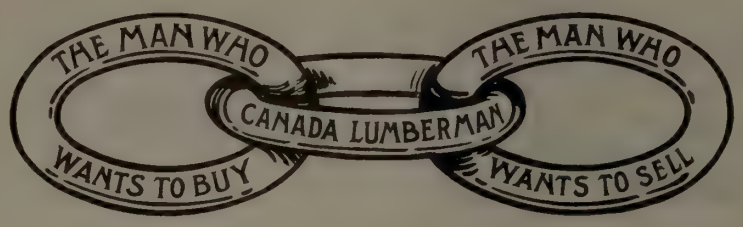
A line to us will bring full detailed description of all or any one of the Coe Machines, Rotary Cutter, Slicer, Drag Saw, Knife Grinder, Clipper, Wringer, Roller Dryer. ***Catalogue on request.***

# The Coe Manufacturing Co.

**Painesville, Ohio, U. S. A.**

*Established 1850*

***The oldest and largest manufacturers of complete veneer equipment.***



# The Connecting Link

Way back in 1880 the **Wanted and For Sale** columns of the Canada Lumberman and Woodworker were used extensively by the lumbermen of Canada for the purchase and sale of timber, lumber and machinery.

Time has but served to enhance the value of this medium, until to-day the **Wanted and For Sale Department** of the Canada Lumberman has become a national market.

Twice a month "the paper with the green cover" brings together buyers and sellers of lumber and machinery from all the principal lumbering centres of Canada and the United States. By covering this wide field, the percentage of waste circulation for advertisers has been reduced to a minimum.

For quick and satisfactory results, get your advertisement in the **Wanted and For Sale Department** of the

"Leather like gold has no substitute."

# Precious Power

If you could operate your plant without paying a cent for power think how your profits would soar. The next best thing is to utilize all the power that you pay for. Have it transmitted to your various machines by belting with a surface that will grip your pulleys. A poor belt provides as sure a leak for your profits as a hole in a boat does for water.

Use the well known Amphibia Belting throughout your plant. It is made of waterproof tanned selected hides.

## To the Owner of Timber Lands

Far sighted owners of timber lands should take advantage of the times incident to the European wars, and prepare themselves for the day when the demand for timber is suddenly thrust upon them. This is certain to come at no distant day. Therefore cultivate a closer acquaintance with your holdings, and the best method of marketing them. Let us prepare the way for you. Remember, we not only report on the property, but assist in marketing the bond issue when necessary. Send for our booklet.

# Do You Believe in Wood?

Sure you do, BUT is your **belief based on the intelligent and profitable use of wood** rather than on expectation of profit from its sale ?

**When you buy a car load of Arkansas Soft Pine** it becomes your property and you can urge its use for any purpose you choose. You know more about lumber than your customers. Are you educating them to use the right kinds or the wrong kinds ?

Now, **just between yourself and the ledger,** does a few dollars extra profit justify you in pursuading a customer to accept something that is not just right for his purpose ? Frequently the question is wholly within your jurisdiction.

You know about the uses and values of wood and what kinds to recommend.

**Just one more question**—Are your customers profiting to the extent to which they should profit by using Arkansas Soft Pine ?

## Arkansas Soft Pine

### Pick of the Pines

***For Interior Trim***—A stock of Arkansas Soft Pine and a knowledge of its merits, beauties and values gives the retail lumberman command of an increasingly larger portion of the Interior Trim trade.

The wood is beautifully figured, of firm, uniform texture, free of pitch and takes stains and dyes in a pleasing and satisfactory manner.

While in many buildings it has been used with oak a much more saiisfactory and uniform effect is secured when Arkansas Soft Pine is used exclusively.

**If you want the trim trade stock up with Arkansas Soft Pine.**

## Don't offer your customers "something just as good"

# Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands; mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

**We have the following Sawmill Machinery for sale:**

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

## FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

## POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

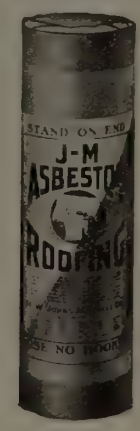
This Emblem is rapidly becoming one of the most widely known trade marks on this continent; but even though it belted the earth, it could not stand more staunchly than it does today for the business principles underlying J-M responsibility.

## This Roofing lifts itself out of Competition and builds up Business on Quality and Service



J-M Asbestos Roofing won't sell to people who want cheap temporary weather protection, for a season only; and likewise you can't sell it to people who want a twenty-five-year roofing at a five-year price. That roofing is not yet made.

But it will sell to owners who want roofing that settles the roofing question once and for all. You have plenty of customers in your community who can see the business common sense of applying J-M Asbestos Roofing.

Never needs painting or repairs—We can refer your customer to many roofs that have given twenty to thirty years of service—without a cent of expense! Has white top smooth surface, is put on with J-M Vise-Grip Roofing Cleats making a fine appearance.

Fire-retardant and spark-proof; resists cold and reflects heat so that it tempers the interior of a building at all seasons. Made of Asbestos and Trinidad Lake Asphalt which contains nothing to deteriorate, so that its first cost is its only cost.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 35 Toronto, May 1, 1915 No. 9

## Export Number—June 1st

The June 1st issue of the Canada Lumberman and Woodworker will be an "Export Number." We need offer no explanation of the reasons which have induced us to bring out an issue devoted to the export trade in wood goods. There has never been a time in the history of the lumber and timber industry of Canada when the export end of the business was of greater importance to the industry than it is today. We are of the opinion even, that its importance today has never before been equalled or approached. This importance exists in the great opportunities now presented for developing the export markets in Canadian wood goods, and in the necessity for doing so in order to place the industry upon a sound basis.

The lumber industry of Canada was born of the export trade. In the course of time its domestic markets grew in importance, but the export trade has always been large and has helped Canada to maintain a balance of trade with other countries. It has witnessed many ups and downs of prosperity, many changes in its chief characteristics, and many struggles against competition, but in the long run it has made a good showing.

Today, the lumber industry of Canada lies in the melting pot of economic revolution. The old courses of trade are being dissolved and broken. New ones are being established. Out of all this disintegration and reconstruction the lumber trade of Canada—if those who are its sponsors realize their opportunities—will emerge with its horizon widened far beyond its present limits.

This is the reason why we will publish an Export Number on June 1st. The information we are preparing for that issue will be practical and indispensable to those who are exporting or hoping to export lumber or timber from Canada.

## Co-operation the Logical Cure

Whenever the question of credits comes up for discussion among a lot of lumbermen, whether retailers, wholesalers or manufacturers, it is a sure thing that everyone present will be interested. No one single question touches all branches of the trade and industry so intimately, or is so important a factor in connection with the success or failure of their business. Although their interests are all affected, it does not follow that they are all affected in precisely the same manner. The chief principles in connection with credit matters are the same all over the world, but they affect different concerns in different ways and it is not a simple matter to induce a lot of retailers, wholesalers and manufacturers to take identical views as to the manner in which credit problems should be handled.

An illustration of this fact has been clearly afforded at the recent meetings of the Lumbermen's Section of the Toronto Board of Trade. Although everyone present at these meetings was agreed that the credit situation in Toronto and in Ontario generally was about as unsatisfactory as it could be, there developed a distinct cleavage of opinion as to the manner in which this situation ought to be dealt with. So far as the retailers were concerned no difference of opinion was disclosed whatever, but among the wholesalers who were present a reasonable doubt was expressed as to whether the question was not one which, under present conditions at least, ought to be handled by the retailers alone. This view was held by several prominent wholesalers who were of the opinion that the solution of the difficulty was largely in the hands of the retailers. Other wholesalers in Toronto however, among them for instance the mover of the motion for the formation of a credit bureau, believed just as strongly as the retailers that the wholesalers were to a considerable extent responsible for the unsatisfactory credit situation, and therefore ought to take part in such a plan for providing a remedy as was proposed. As to the rightness or otherwise of these opinions the Canada Lumberman does not wish to make any statement at present, but as to the necessity for doing something very radical and doing it quickly we have no hesitation in saying what we think.

There is no single question which has been discussed in private by lumbermen with representatives of the Canada Lumberman, more frequently, or more earnestly, than this question of credits and their management. We have seldom made a round of visits among the trade in Toronto, or anywhere else in Canada for that matter, without having come across some lumberman who wanted to have a heart to heart talk upon this subject. Sometimes the discussion takes the general form of a talk about ways and means for improving the situation. At other times it takes the form of a denunciation of some other lumbermen who have transgressed the ordinary rules of business common sense. The strange thing from our point of view is, that until the matter came to be discussed jointly by members of the Lumbermen's Section of the Toronto Board of Trade, no one had thought that it would be worth while to seek out a remedy based upon co-operation in connection with the Toronto trade.

The trouble caused by granting indiscriminate credits is one of ancient standing, yet we believe that the only thing necessary in order to devise and put into operation a successful plan for improving matters is that members of the trade should become better acquainted with one another than they have in the past. This is one of the objects of forming an association of lumbermen such as the Section of the Board of Trade, and an organization of this sort will not be living up to its opportunities if it leaves this important question aside before putting into effect a definite plan for improvement founded upon confidential exchange of information.

No lumberman needs to have information given to him as to the actual manner in which loose credit management demoralizes trade. The working out of the evil once it has secured a foothold, is rapid and certain. The strange thing is that it is ignored by so many people when its symptoms are so definite and clear. Although everyone who is engaged in business knows the dangers, it seems as though there are in the lumber business, as in every other line of life, a large percentage of men who have an absurd idea that their own case is an exception. These men are the responsible ones. It is by means of

their weakness that the perennial crop of dishonest men manage to keep their hold on the trade long enough to make a good clean-up at the expense of men and firms who should have known better and of others who have felt themselves driven into the maelstrom of price cutting by the fierceness of competition. The individual who will take advantage of this tendency on the part of business men who consider themselves exceptions to the natural laws of business, will always be with us and will continue to prey upon us so long as we fail to get together. Getting together, in the widest sense of the phrase, is the only manner in which the situation can be cleaned up. It is not a difficult problem. It is rather a personal problem, one which depends upon good fellowship, business confidence between legitimate members of the trade and a determination to co-operate in bringing about a sadly needed reform.

---

Talking of credits and of the manner in which careless handling of credits may lead to serious loss, a few examples are worth mentioning. If necessary we could bring forward a great many, but we well confine ourselves to two which have lately come to our notice. Recently an auction sale was held of the effects of a certain firm of lumbermen. The stock of lumber was sold at 65 cents on the dollar. This stock was valued at about $16,000. The book debts of the company, amounting to over $31,000, were sold for the ridiculously low price of 6 cents on the dollar. It is hard to conceive how any firm could have seriously considered itself capable of doing business which would allow credit to its customers to the extent of just about double the value of the stock which it had on hand. Perhaps it is possible to do business in this manner if the firms to which credit is given are of such excellent standing that the book debts will show a large percentage of good accounts, but with stocks bringing 65 cents on the dollar and book debts to twice the value of the stocks bringing only 6 cents on the dollar there must have been some remarkably loose credit management, which could only result in early and complete failure.

Outside of the lumber trade the same situation exists in many other lines of business. We have before us a copy of the minutes of the meeting of creditors of the Imperial Export Company, Limited, of Toronto, which made an assignment on March 24th, together with a printed statement of the company's affairs, which was presented to the creditors. The assignee explained to the creditors at the meeting that the deficiency between assets and liabilities was approximatly $179,500; a very large percentage of the total liabilities, which were $217,884. The assets amounted only to $38,716. The asests included accounts receivable considered good, to the amount of $1,688; doubtful to the amount of $9,538 (estimated to be worth $2,550), and bad to the amount of $30,826. Of the accounts receivable, therefore, amounting to $42,054.20, only $1,688 can be reported as good, while over $40,000 is nearly all of no value, a small portion being considered of slight value. Yet this firm carried on business in a large way and maintained offices in Toronto, Melbourne and Buenos Aires, and was able to get extensively into debt with many large firms of long standing.

An important feature of this particular case is the list of creditors included in the statement of affairs. The direct creditors included firms and individuals of long standing and widely recognized business ability. It is impossible in all these cases to assume that the creditors could not, in some manner, have learned that they were treading upon dangerous ground, long before the assignment was made. There is unquestionably great need for something far more definite in the way of checking up credits in the business world of Canada than has been put into practice in the great majority of cases up to date. Credits can be handled and are being handled by many successful firms with scientific accuracy, and unless this is done by others there must be great loss of profits and continual danger of failure.

---

# Ontario Retailers Need An Association

Although there is so much talk of co-operation and association work among lumbermen in Canada, the field for such a laudable movement is sadly neglected. There are many associations now in existence, all of them doing good work in their respective fields, but there is room for many others, also room for a widening of the scope of those already at work. There are manufacturers' and wholesalers' associations and some retailers' associations, but the country is not sufficiently covered in connection with any of these. The manufacturers and wholesalers have done the best so far, but are far from realizing a reasonable share of their possibilities. Every manufacturer of lumber in Canada who takes a businesslike interest in his work ought to be a member of the Canadian Lumbermen's Association and of any local manufacturers' association in his district. Among the retailers there is great need for association work. In no one field of the lumber business is there such lack of co-operation and such regrettable distrust of one another as there is evident in practically every district where competition comes into play. It leaves the retail lumberman a prey to the scheming of his customers, obliging him to give terms of credit which are unwise; to reduce prices to unsafe levels, or to lose business; and in a hundred and one ways to conduct affairs in a manner unworthy of a man whose ambition is to make an honorable living in an honorable business.

Take the matter of handling customers as an instance of the way in which failure to co-operate works out. The retailer becomes practically at the mercy of the customer. The customer may get into the retailer's debt and delay making payment almost indefinitely, and when the retailer at last becomes exasperated and refuses to sell any more until the bills are paid, the customer simply goes to another retailer and starts over again. If the second retailer asks the first one for information regarding this prospective customer when he switches his business, how likely is he to get information upon which he can depend; or even to act upon such information, whether it has been given in good faith or not? The probability is that he will follow his own judgment irrespective of the information he may have secured. He has been stung so often by customers, by other retailers, and sometimes even by wholesalers, who sell to his trade, that he is sceptical of everything except his own personal experience of a customer's ways of doing business, so, the new customer has the whip hand in nearly every case.

An instance which we heard of recently illustrates the above point very clearly. A prospective new customer came to a retail dealer for lumber. When the terms of payment were under discussion it developed that the customer had been dealing with a competitor and was switching his business. The retailer asked him why he was doing so and was told that the other retailer had not been treating him satisfactorily. So the second retailer asked if there would be any objection to his telephoning the other retailer for information as to the customer's promptness in paying bills. No objection was taken and the following line of conversation took place over the telephone.

"Mr. A. wants to buy some lumber from me. He used to be one of your customers. Can you tell me what sort of pay he is?"

"Well, he is a little bit slow."

"Does he owe you anything"?

"Yes, a little bit, and it is hard to get it out of him."

"Thank you, very much, good-bye."

Turning to the customer the retailer told him exactly what the other retailer had said. The customer appeared surprised, but presently said he would call again in a short time and show the retailer something interesting. A little later he returned and laid before the retailer a bundle of receipted bills for lumber which he had bought from the other fellow, indicating clearly that he was in the habit of paying his accounts in a satisfactory manner and that the other retailer had been giving his competitor untruthful information. He had thought to keep this man's trade, but in reality the result was that he confirmed the customer's bad opinion of him and lost his trade completely. We have heard of cases of this sort of thing from all parts of the country.

It seems to us that the only cure is association work, which will

bring members more closely in touch with one another, showing them that they will be more prosperous if they act towards one another as reasonable business men. If the formation of an association of retail lumbermen in Ontario, for instance, could be brought about, and could be followed up by a plan for the exchange of information regarding the credit standing of customers, the retail lumber trade could be placed upon a much more substantial and satisfactory basis. This sort of thing has been effectively worked out in other parts of the country, both in Canada and the United States. In some cases it is handled locally by the trade in a well-defined district. Organizations of this nature ought to be developed in connection with the retail trade in the chief consuming districts of Canada. In Ontario, for instance, such organizations could avoid heavy losses and much trouble to the local trade and they could exchange information with similar organizations in other districts whenever necessary.

A few days ago we received a letter from a prominent firm of retail lumber dealers in southwestern Ontario which we are publishing elsewhere in this issue. The writer of this letter advocates strongly the formation of a retail-lumbermen's association in Ontario, not so much for the purpose of regulating credits, as discussed above, as with a view to relieving the retailer of another trouble, which, while not so extensive, perhaps, as his credit trouble, is nevertheless, a serious one. He discusses bitterly the dishonest methods of a few wholesalers with whom he has done business at one time or another. It is a matter for congratulation that so many of the wholesalers in Ontario are men of honorable business instincts, but there are others whose ideals are based largely upon the belief that the only thing to consider is the actual transaction which may be under way, and how it can be made to yield the greatest profit without any consideration of the interests of others in the trade. The particular case which this retailer uses as an instance is a flagrant one. He tells of a wholesaler who took a high moral standing in his discussion of business methods, assuring the retailer that he was doing all he could to protect his customers. The retailer found, however, upon one occasion recently, that a considerable amount of lumber was shipped into his district and unloaded by farmers. The sale had been made direct by a wholesaler to the farmers and investigation showed that the wholesaler was none other than the one who had been pretending to protect his customers. It is needless to say that this wholesaler, while he made a pretty good profit on the sale of this stock, lost entirely the custom of this retailer, who carries on a business of considerable extent in his district. The wholesaler has grabbed at the shadow and lost the substance. Moreover, it is a pretty sure thing that this retailer will advise other retailers, with whom he may be on intimate terms, of the manner in which the wholesaler has duped him. It is regrettable that there should be any such behavior on the part of important members of the wholesale trade. We suppose that so long as the trade exists, however, there will always be some of this class of dealers, and for this reason also it is important that retailers should work out some plan for protecting themselves.

# How the Stamp Tax is Working Out

Since the stamp tax upon cheques, bills of exchange, promisory notes, etc., was imposed on April 15th, numerous enquiries have reached us as to the proper manner in which to comply with the new regulations. Although the tax has only been in effect for a fortnight the public has become pretty well accustomed to it and there is not now anything like the uncertainty in regard to what should be done, that there was at first. There has developed, of course, considerable diversity of opinion as to how the tax will work out as a revenue-producing measure, and as to how it ought to be worked out in order to be as fair as possible to all parties concerned. What we are interested in at present however, is the actual working out of the measure under existing conditions. Considerable enquiry which we have made among bank managers and lumbermen shows that the situation is about as follows:—On cheques, it is necessary for the person issuing them, that is to say the person whose signature appears on the face of the cheque, to attach a stamp. Otherwise he renders himself liable to a penalty not exceeding $50. On drafts presented to the bank for collection, the person presenting the draft must attach a stamp, irrespective of whether the bank succeeds in making collection or not. A similar penalty is provided in this case. Promisory notes or bills of exchange when delivered to the bank must have a stamp attached by the person delivering them.

As a result of these regulations, the burden of the tax in some cases does not seem to be placed upon the right party, from a business point of view, although it is being pretty generally accepted in a philosophical and uncomplaining manner. In the case of cheques for instance, one would naturally expect that the person in whose favor it is made out would be very willing to affix the stamp. This may be done in some cases, but the regulations state definitely that the issuer is the responsible party and the one liable to fine. For this reason all the information we have been able to secure from various sources indicates that it has already become the definite practice of those who issue cheques, to attach the stamp. Likewise, those who send drafts to the banks for collection are attaching stamps. During the first few days the bank returned many drafts which had not been stamped.

One enquiry which we received recently related to "time cheques" issued by logging operators for payment of their workmen in the woods. These time cheques, are payable at the head office of the company wherever it may be located, but many of them are handed to merchants in payment of an account, and from the merchant they reach a bank which presents them finally at the head office for payment. We are advised by the Finance Department at Ottawa that these "time cheques" are "bills of exchange" and not strictly cheques. The company issuing them does not require to place stamps upon them, but the party who tranfers them to a bank must place stamps upon them at or before the time when he negotiates them.

---

A large flagstaff has been got ready for shipment to England, where, as a present from the Government of British Columbia, it will interest the crowds of Londoners who flock to Kew Gardens, the famous botanical gardens a few miles up the Thames from London. The flagstaff is the most perfect specimen in existence, for from end to end it is absolutely without a flaw. When it was cut on the limits of the Brooks, Scanlon & O'Brien Company at Gordon Pasha Lake, the stick was 236 feet long, but 20 feet was cut off later owing to a flaw being detected. In its original state the stick was five feet in diameter at the butt, and 14 inches in diameter at the top, and as straight as could be. Since the workmen have finished dressing it into shape, the stick now has a diameter of 32 inches square at the butt for a distance of 16 feet. For the next 100 feet it has an octagonal shape, and for the last 100 feet it is perfectly round. The upper 200 feet is a gentle taper from 32 inches to 12 inches.

---

The United States Commissioner of Currency recently made enquiries of eighty National Bank examiners as to business conditions, asking them for special reports upon the outlook. Ninety per cent. of the replies received stated that a permanent improvement in business conditions has taken place recently. According to a summary of the reports, which has been made public by the Commissioner of Currency, hopefulness is apparent in nearly every district. Agricultural conditions are said to be generally excellent and commercial lines, with comparitively few exceptions, are enlarging their activities mainly as a result of an increased demand, but in some instances in preparation for new business, which is expected to develop with the coming of good weather. Industries receiving orders for supplies from foreign countries are described as especially buoyant.

---

For the fiscal year ending March 31, 1915, the receipts at the Dominion timber office at New Westminster, B.C., totalled $72,031.84 and for the corresponding period ending the last of March, 1914, the receipts were $59,601.47.

# Toronto Trade Discusses Credit Bureau

## Spirited Views Expressed Regarding Importance of Adopting Plan for Checking Credits—Positions of the Wholesaler and the Retailer

The Lumber Section of the Toronto Board of Trade held a meeting on April 9th at which an important discussion took place in connection with a proposal to form a credit bureau. Mr. J. L. Campbell, chairman, presided.

After the routine business had been disposed of Mr. A. E. Clark, introduced the discussion of the proposed credit bureau. Mr. Clark had given notice of motion at the previous meeting that a credit bureau might cover the trade of Ontario or even further if they saw fit. Similar bureaus were being run at present in connection with the Canadian Lumbermen's Association and in connection with some of the large lumbermen's associations of the United States. The operation of such a bureau went much further than that of any commercial rating company. From the commercial rating companies you could not get information to the effect that a man was a chronic kicker, claiming shortages, etc. He had in mind a man who invariably made claims for shortages. On one occasion he had claimed that a car was 200 feet short. Mr. Clark had gone to see the car without this man's knowledge and found that it had not even been unloaded. That was only one small item, but it was indicative of the general situation. There were concerns also throughout the country who were not entitled to credit at all, but who got a little credit from many wholesalers. If a credit bureau were established it would work out to the benefit of both wholesalers and retailers, by furnishing a means of checking up credits both from a financial standpoint and also from a moral standpoint. He suggested that they should form a committee to look into this situation and secure information from organizations which are running similar systems. In time, he believed, they could form a good credit association for Ontario. Mr. Clark concluded by presenting a resolution to the effect that a committee should be appointed. Mr. W. C. Gall seconded the motion. Referring to the necessity for a credit bureau Mr. Gall instanced cases where men would secure credit from one firm and go to another and get a little lumber from them until they had practically gone the rounds and everybody was caught. A credit bureau would be an infinite benefit to the trade.

### Breaking the Heart of the Legitimate Retailer

Mr. J. B. Reid spoke vigorously in support of the proposition, saying that the retail man suffered when the wholesale man suffered and if there was anyone who ought to be protected it was the retailer, who should be protected by the wholesaler. The wholesaler also ought to be protected by the manufacturer. So long as wholesalers continued to sell to men who could not and would not pay, they were breaking the hearts of the men who would pay. The wholesale men today were weeping more than he had ever heard them in all his experience. He believed that the war had nothing whatever to do with this situation. The real cause of the trouble was that there were too many men trying to do business as retailers. There was not sufficient business for them all to make a decent living. The consequence was that everybody was grabbing for everything at any old price. Some people were not satisfied to run a small yard as had been the case in the old times when the running of a small yard was an honorable occupation. Today, if a man wanted a load of lumber to build a house, and dug a small hole in his front lawn in the morning, before the next morning, there would be three or four men sitting on his door step waiting to sell him lumber. When these men came along to see the builder he gave them lists and waited to see what was doing. The salesman with the list would return to the office and persuade his firm to furnish the lumber. That was the way the retail business had been going on for the last two or three years. It was not being run as it ought to be run. When a man wanted lumber he should be made to go to a responsible yard and pay a respectable price. The man who sat on the door step looking for the builder's trade did not care anything about bad debts. He was getting his salary and going around looking for more prospects. If the wholesaler would give a retailer lumber in return for promisory notes on which 10, 15 or 25 per cent. only would be paid when they fell due, and the balance renewed indefinitely, where would he land? He would have a fine book full of debts upon which he would never recover more than half.

As far as the credit bureau was concerned, the best advice they could get was the advice they could give one another. They must be honest among themselves and expect their customers to be honest with them. When they got information from half a dozen men in the trade about a proposed customer they would be able to size up the man's financial and moral responsibility far better than they could by getting information from any mercantile agency. He thought that they should have in the files of such a bureau a book in which all such information would be set forth. If a lumberman were to be stung by a customer he should give information to that effect, giving the name of the customer and the amount. This information should be filed away and no one should have authority to divulge the name of the party making a report. The information would be available for every member of the bureau, thus giving those who were trying to pay their way, a chance.

### The Speculative Builder's Evil Influence

Mr. Reid thought that the ball had been started rolling in the right direction by Mr. Clark. Speculative builders, he believed, had been the curse of the lumber trade. They were purely and simply gamblers, taking great chances. They had no money on which to take a chance, but they took it upon the money of the lumbermen. If they won they won, and if they lost the lumberman lost. His experience had been that there was always a tail to the cat, and the last fellow got squeezed good and hard, and the profits he had made out of the first half dozen deals were all eaten up in the last one.

A lot of the trouble came from worrying too much about what the other fellow was doing. They ought not to care what the other fellow was doing. The two loads that he sent out might be going to perdition, while your one load was making good. If the lumbermen could get together and form some kind of a system to look after the credit trouble there would be a great improvement in the whole trade. No lumberman had ever lost one dollar through men who came to their yards for supplies, compared with $100 lost through men whom they went after. Mr. Reid also dwelt forcibly upon the wholesaler's connection with the situation, claiming that the wholesaler, by granting credit indiscriminately to every man who called himself a retailer, was encouraging cutting among retailers and preventing those who were trying to do an honest and profitable trade from doing so.

Mr. Norman Hocken, Otter Lake Station, Ont., expressed hearty approval of the proposal to form a credit bureau. This was a proposition, however, which would require a great deal of thought in order to work it out successfully. He suggested that they should all give their attention to the subject and come to the next meeting prepared to discuss it in much greater detail. They would probably then be able to lay down definite plans which a committee could take up and work out.

### Credits Extended Without Proper Enquiry

Mr. A. E. Clark again discussed the subject saying that he agreed with Mr. Reid that a large portion of the trouble in Toronto had originated from wholesalers issuing credits without making proper enquiries. It was just as necessary for the wholesaler to check his credits as it was for the retailer. The wholesaler and the retailer must work together on such a question. Speaking as a wholesaler he thought that wholesalers were partly responsible for the present situation. If they could put into effect a practical credit system which would enable them to eliminate a lot of those men who had their offices under their hats or on somebody's door step, and thus give the trade to the legitimate lumber dealers they would raise the standard of the business and also its profits.

Mr. J. L. Campbell, the chairman, thought that the credit problem was definitely divided into two parts, one relating to the wholesaler's business with the retailers and the other relating to the retailer's business with his customer. If the retailer were careful about his credits and sold only to those who were responsible and sure pay his cost would be reduced to a minimum and there would be no danger to the wholesaler provided that he sold only to the retailer who conducted a legitimate business. If the wholesaler went past the retailer and sold to the retailer's customer he was demoralizing the trade.

Mr. Reid remarked that if the wholesaler sold to the legitimate retailer who paid his debts when they fell due, Mr. Campbell's argument was sound, but if he sold to a retailer who did not pay his debts it was unsound.

Mr. Campbell replied that he was just coming to that point. If the wholesaler sold to the contractor or to the consumer, going past the retailer, he was taking from the retailer business to which the latter was entitled and upon which he should have a profit. In that way he was reducing the capacity of the retailer to pay his bills to the wholesaler and was helping to make the retailer a poor retailer. The wholesaler ought to scrutinize his accounts just as carefully as the retailer and cut out the men who were not meeting their paper in

the proper way. One of the great difficulties with the retailer, he thought, was that he so often wanted to do all the business. This was one of the most serious errors that a man could make. Every man should recognize that the other fellow had a right to his share. Failure to recognize this fact led to price cutting, bad debts and trouble for everybody.

Mr. G. W. Boake said that the trouble the retailers were up against was that every man who hung out his shingle as a retailer had all the wholesalers calling upon him offering him any terms he wanted. Then, when the wholesaler came across a bill that was too large for this class of retailer to handle, the wholesaler often went straight to the contractor. The result was that the legitimate retailer was up against it on both sides.

"Had not the retailers a remedy in their own hands largely, by refusing to buy from wholesalers who sell to the retailers' customers"? Mr. Campbell asked. Mr. Boake replied that he thought this was the case.

Mr. Reid thought that the retailers would be perfectly satisfied to compete with any other retailers if they knew that the man who sold to the competing retailers made him pay for the lumber when the time was up.

Mr. Boake agreed with this, but remarked that the great trouble was that so many men tried to get into connection with the new customers and to give them all the credit and all the lumber they wanted.

Mr. W. B. Tindall spoke of the manner in which his company, the Parry Sound Lumber Company, had handled its credit affairs. He believed that his company had not had a loss of more than one-half of one per cent. on account of the extension of credit. They watched their credits rigidly. They never let an applicant for credit make his own terms. That principle had been followed out as far as was consistent. Much of the trouble in connection with credits arose from the fact that many men went into business without sufficient capital, trying to do a ten, fifteen, or thirty thousand dollar business on one thousand dollars of capital. They went to the bank for credit and the banks made them pledge everything they had. Then, when they wanted to get more capital, they went to the wholesaler who was supplying them with lumber and all too frequently obtained further credit to which they were not entitled. When trouble developed the wholesaler found that the bank had everything tied up so tight that he could get little or nothing in payment for his lumber. If the wholesaler would investigate these men and find out the extent to which their stock had been pledged or their credit exercised, the situation would be very different. It happened frequently that the salesmen had too much to do with the extension of credit. There was not a salesman made who ever was a good dispenser of credits. The man who sold should have nothing whatever to do with extending credits. In his company, when a man wanted credit he was always referred to the "mean man" in the office, who was especially capable of looking after the credit situation.

At the suggestion of the chairman, the discussion was adjourned until the next meeting.

The next meeting was held on April 16th. Mr. Campbell gave an outline of the discussion at the previous meeting and a further interesting discussion took place. Mr. W. J. Lovering suggested that the creation of a credit bureau as suggested would duplicate to some extent the work done by the Canadian Lumbermen's Association which furnished wholesalers with information regarding the credit standing of retailers.

Mr. L. F. Strickland said that there were enough retailers in the Board of Trade to make it worth while to try such a plan. If a credit association existed the interests of the wholesalers would be taken care of, as well as those of the retailers.

Mr. Lovering thought that this might be the case and added that according to his idea it would be best not to have a regular bureau of information, but simply to exchange confidential information at regular meetings.

Mr. Boake thought it was important that they should work out some plan for giving a better idea as to the retailers' standing than was at present available. The more carefully the wholesalers watched their credits and the more systematically they exacted payment when it was due, the better it would be for the retail trade.

Several other members took part in the discussion drawing attention particularly to the expense which would be involved in forming a regular credit bureau and the large amount of clerical work which it would involve. The discussion finally centred largely around the point as to whether such a plan for reporting upon credits should be handled entirely by retailers, or whether the co-operation of the wholesalers would be essential. It was evident that the opinions of those present were as yet unsettled in regard to this point, although all were agreed that the necessity for introducing some definite plan for checking up the credits of retailers and contractors was a most pressing problem.

The discussion on the subject was again adjourned until the next meeting.

## Lieutenant in an English Regiment

Lieut. C. P. Waldie of Victoria Harbor, Ont.

Mr. C. P. Waldie, whose portrait we publish herewith, is well known to lumbermen in Ontario as the manager of the Victoria Harbor Lumber Company, at Victoria Harbor, Ont. Mr. Waldie felt the call to go to the front, soon after the war commenced. He left Canada in September, proceeded to England, where he secured a commission as a lieutenant in the Queen's Royal West Surrey Regiment. At present Mr. Waldie is stationed at Worthing, England.

The Victoria Harbor Lumber Company operate three mills at Victoria Harbor, which, together with the power house and an excellent piling yard, make up the company's plant. The mills are equipped with everything that goes to the creation of a modern and efficient lumber producing plant. It has been in the management of this large plant that Lieut. Waldie has been engaged. He devoted his whole time to the business of superintending the plant and its output. Lieut. Waldie is a son of the late John Waldie, who made for himself in the lumber business of Canada a name which stands among the very highest.

## Personal News of the Trade

F. L. Johnson, Jr., advises us that he has moved to 1231 Lumbermen's Exchange Building, La Salle and Madison Streets, Chicago.

Mr. R. Wilson has been appointed secretary of R. Macfarlane & Company, Limited, lumber merchants and sash and door manufacturers, Montreal.

Geo. Weisner, formerly with the Long Lumber Company, Hamilton, Ont., has joined the selling staff of the Canada Lumber Company, Weston, Ont.

Mr. Leon Gagne, Jr., formerly General Manager of the Western Lumber Company, Montreal, has assumed charge of the purchasing and selling ends of the Canada Lumber Sales Company, Limited, Montreal.

Herbert McKnight, Cobalt, Ont., in a letter to the Canada Lumberman states that he finds business good, war or no war. Mr. McKnight is a wholesale dealer in lumber, handling spruce, pine, ties, poles and piling.

J. M. Donovan, of the Long Lumber Company, Hamilton, Ont., whose office was formerly in Toronto, is again covering the city of Toronto for the Long Lumber Company and will visit the Toronto trade for about a week in each month.

Mr Harold Bradley, general manager of Forest Products, Vancouver, B.C., states that his company has received a standing order for 200,000,000 feet of hemlock logs from a prominent Puget Sound box manufacturing company. The order follows upon a trial order for 600,000 feet of lumber supplied a short time ago.

Captain R. S. Bingham, manager of the Coast Lumber Yards, Limited, Winnipeg, has been granted leave of absence and Mr. W. H. Sinclair will be in charge of the company's business until Captain Bingham's return.

Hon. John C. Kaine, Minister without portfolio in Sir Lomer Gouin's Cabinet, has been nominated Legislative Councillor for Stadacona, P.Q. Mr. Kaine has represented Quebec West in the Legislative Assembly since 1904. He was made a Minister by Sir Lomer Gouin two years later. Mr. Kaine is a prominent and successful steamboat owner and lumber merchant.

Mr. J. William Jones, a member of a prominent timber firm in Liverpool, England, who recently visited Victoria, B.C., expressed himself as much impressed with the outlook for the timber industry. "With the favorable freight rates afforded by the opening of the Panama Canal," he said, "British Columbia should be in a position to compete advantageously with the Baltic, where formerly England secured most of its timber. The lumber obtainable in British Columbia is well adapted for box making, and I see no reason why an extensive trade should not be developed between British Columbia and the British Isles." Mr. Jones' firm recently placed an order with a Victoria company for 500,000 wooden boxes, a branch of the business in which his firm specializes, and he has just completed arrangements for their shipment to the Old Country.

# The Reader's Viewpoint on Trade Topics

## Retailer Urges an Ontario Association—Vigilance Necessary for Credit Management—Wood Silos Filling the Bill

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—

### Ontario Retailers Should Organize

Editor Canada Lumberman: Exeter, Ont., April 22.

We have for some time been debating in our minds the question of wholesalers selling to other than retailers. and we feel that the question is one in which every retailer in the country is and should be interested.

From time to time we have been subject to such treatment, from wholesale firms, who sell direct to farmers, and we expect that other retailers have received the same treatment. We know there are a large number of wholesalers loyal to the retail trade. but you will find in all business relations some who will do business and care not how till they are caught red handed. Then you must listen to their excuses.

We have now in our mind one firm who delivered two cars of cedar posts to our station in the last month, same was unloaded and paid for by farmers themselves. This firm have the reputation for doing the same thing elsewhere. They have since informed us that they are very careful to whom they sell and always protect their customers. We have been buying from this firm for some time, so this proves their protection is not to be depended upon.

It is up to every retail dealer in this part of the country to raise his voice or pen to combat this class of business. We, as business men, must look after our part of the business and see that it is conducted to our own interest; not by charging the consumer a large profit, but by running our business on a fair margin and getting what business there is in our communities. Is it not in the interest of the wholesale firms to see that we get fair treatment in this matter, as business for us is business for them. We might add that now in this time of depression of all time, is the time for them to be loyal.

At the present time there is no other class of people, who can help the trade better than the farmers. as most of them will allow a business man a fair margin, but you will find a few wise ones, who think they should have all, and are wise enough to pull the wool over the eyes of the simple-minded wholesaler, to sell them a car of posts once a year. When a wholesaler has done this he will find out that he has lost his retail business in that section of the country for good.

Would it not be a wise plan on the part of the retailers to organize themselves into districts and meet once a month to talk matters over. We would then be in a position to meet the wholesale dealers who sell to consumers, in an organized body, have no business dealnigs with them and fight them to the last ditch? We do not know of any body of men who have less organization than the retail lumber dealers, and as long so we stand by and let others combine themselves, it will be to our loss.

Now in conclusion let us say as for us, we are out to give this class of wholesalers their dues and we will not buy from them and will do all in our power to hit their trade wherever we find it.

We would be pleased to hear from some of your readers in reference to the above matter as it is striking at the very foundation of the retail business.—The Ross-Taylor Company, Limited.

### Vigilance Essential to Credit Management

Editor Canada Lumberman:— Toronto, Ont.

We have been interested in many of the articles and letters which have recently appeared in the Canada Lumberman discussing the situation in connection with credits and collections. This is one of the most important features in connection with the wholesale lumber trade and we have given it close study.

Before we sell any stock to a man we secure all the information we can in regard to his financial standing, his general habits, etc., and particularly as to his way of doing business, that is to say, whether he is a money-maker or is one of those who conduct their business in a slip-shod manner. We make up our minds before we sell him anything, how much credit we are prepared to give him on regular terms. Our terms are two per cent. thirty days from date of shipment, and three months net from date of shipment.

When a man's bill comes due, if he does not pay we want to know why. In fact we insist on knowing why very definitely. In any case we insist upon a part payment, unless there is some very good and exceptional reason.

Discretion must be used in connection with every individual case. Each case must be decided upon its merits. The secret of successful collections is to know your man and to know when to grant an extension and when to decline it. If we think that a man is treating us fairly, and we find that he is urgently in need of an extension of time we grant it, but if it once gets into our heads that he is not giving us a square deal we close down upon him very sharply. There is no other way of handling the situation.

As we said before, the matter is one in regard to which definite procedure must be applied right up to the point where a man asks for an extension, and after that discretion must be used, because that is the critical point at which you must form your opinion as to whether assistance will enable the customer to pay his bill in full in a reasonable time, or as to whether it will simply encourage him to stall you off indefinitely.—Wholesaler.

### Wooden Silos Superior to Cement

Editor Canada Lumberman:—

This season, in this locality, will be a very busy one in the silo end of our trade. There are several kinds on the market which are being sold and used in this district, but this year the wood silo is taking the lead. The farmer is waking up to the fact that the cement silo draws frost, and causes more lost feed than the wood silo. I have been investigating somewhat in this line, and find that the majority of the farmers are more favorably inclined toward the wood silo than before. I have found that the silage freezes to a thickness of from eight to twelve inches in a cement silo, while the same degree of frost will scarcely cause a noticeable effect in a wood silo. One man said his wooden silo had two inches frozen in it last winter, and his cement one had over ten inches, which shows the difference in the conducting qualities of cement and wood. The time has come when the farmer is becoming a little more particular as to what he buys, and he will not always rise to a glittering bait. The writer has a good deal to do with the farmer trade and finds that you must have a good article, as one farmer tells another, and so on it goes.

Some time ago I saw an article in your paper to the effect that the lumber dealer should not sell any side lines. Well, in our case, we would come out at the short end of the stick if we did not have other lines, as some people wish to try different lines of lumber. For instance, if a farmer wishes to try a cheap ready roofing instead of shingles, I certainly might as well sell him what he wants as let him go to the hardware dealer, where, perhaps, while he is getting his roofing he may buy one of their cheap screen doors, which the country dealers sell.

I have my money tied up in the lumber business, but if I cannot sell lumber I must sell something which will help to make a profit, and overcome the shortage caused by not selling lumber. I might add, that there is nothing in the building trade which you cannot purchase through us as dealers here, except hardware.

If we do not have it in stock, we have arrangements with firms who will supply us direct with our different needs in this line. It is very nice for the small village dealer to know that there is a "big city" dealer who will supply him with anything he may require, and save him from buying perhaps a whole car when he only needs a few pieces. —Country Retailer.

### Lumberman Furnishes Machine Guns

J. B. Fraser, the well-known Ottawa lumberman, has donated two addition machine guns to the machine gun section of the 8th Canadian Mounted Rifles. The section will thus be increased from a two-gun equipment to a four-gun equipment and will be under the command of Lieut. Fraser, second son of Mr. Fraser. Mrs. Fraser has already donated one machine gun and the Militia Department one gun to the section. Lieut. Hugh Fraser, another son, is at the front with the first contingent, and was an officer in the Governor-General's Foot Guards.

Mr. Robson Black, Toronto, has been appointed secretary of the Canadian Forestry Association in succession to Mr. James Lawler, who resigned at the annual meeting last January, after six years' service. Mr. Black is a graduate of Queen's University, and has been engaged in journalistic work in London, Montreal and Toronto. He has had considerable experience in organization work and expected to take up his new duties at Ottawa about April 15th.

# Ontario Output Showed Increase

## Production of Timber Under License During 1914 Exceeded 1913 by 22,204,830 ft.—Revenue Shows Decrease

The annual report of the Minister of Lands, Forests and Mines of the Province of Ontario, for the year ending October 31st, 1914, has been issued. The report states that the revenue accrued due from woods and forests for the year ending October 31st, 1914, was $2,009,131.43, a decrease of $118,191.13, as compared with the accrual of 1913. The revenue collected during the year from woods and forests amounted to $1,674,887.93, a decrease of $304,237.88 as compared with the revenue collected in 1913. The revenue from timber dues was $1,112,480.38 against a collection of $1,277,490.08 in 1913. The collection on account of bonus was $454,167.24 as against $591,676.29 in 1913. The collection on account of ground was $103,910.31 as against $99,460.19 in 1913. The revenue from transfer fees was $4,330 as against $10,500 in 1913.

The area under license in 1914 was 17,333 square miles, as against 17,517½ square miles in 1913. The area under license varies from year to year from several reasons. Areas cut-over are dropped and other areas go into what is called "abeyance," that is, the ground rent not being paid the license does not issue, or perhaps Crown timber dues are owing, in which case the license does not issue. Then the next year the ground rent or dues having been paid up the licenses are again issued and the area under license is considerably increased although no sale has taken place. There was surrendered during the year 1,111 square miles and new licenses were issued for territory aggregating nearly 500 square miles.

### Volume of Output

The production under license of pine timber, sawlogs and square timber, etc., in feet board measure during 1914 was 382,582,027 ft. B.M., being 22,204,839 ft. B.M. in excess of the output of 1913. The output of timber other than pine in 1914 was 77,451,857 ft. B.M. as against 64,097,436 ft. B.M. in 1913. The quantity of pulpwood taken off Crown Lands was 104,544 cords as against 131,434 cords in 1913. There were taken out 5,439,845 pieces of railway ties as against 6,355,828 pieces in 1913.

### Financial Stringency

In the report for 1913 the existence of financial stringency was referred to and the opinion was expressed that there would not be much increase in the output of logs. Financial matters did not improve, but on the contrary became worse in the sense that the war came upon us in August just when lumbermen were making arrangements for the payment of accounts for the previous season and also for advances on account of their lumber operations during the coming season. For some time after the breaking out of the war financial matters were in a state of chaos and lumbermen found it impossible to finance both their operations and the payment of their accounts for timber dues and they frankly said so. The Department has never failed to take into consideration the state of financial matters and to assist in preventing a crisis in the lumber trade by extending leniency to those indebted to it for timber dues, because the security of the limits is good. In pursuance of that policy the Department did not press for payment in full of accounts for dues, etc., consequently the collection from woods and forests has been about $304,237.88 below the estimated revenue. It is not expected that the output for the winter of 1913-14 will greatly exceed that of 1912-13, although the financial position is somewhat improved.

The report states that several fires occurred last year. A few in the Mississaga Forest Reserve, which necessitated the sale of some timber berths in order that the timber should be cut during the present season. There was also a serious fire in the Algonquin Park which was extinguished with difficulty and not until considerable timber was damaged. This timber was offered for sale, but owing to the depression in the timber trade no bids were obtained. On the whole, however, the fires on lands of the Crown were not serious, and except on licensed territory, no losses were incurred. There were several fires on licensed territory, notably in the Townships of Parkin, Goschen and Montgomery.

The cost of patrol of forest reserves was $84,148.59; on railways and Crown lands $148,079.28. The cost of extinguishing fires in forest reserves was $2,952.07; on railways and Crown lands $2,508.77. There are 325 rangers on licensed lands, the estimated cost of which would be approximately $85,000.

## Lumber Carrier Torpedoed

A British tramp steamer, known in the North Pacific lumber trade, was recently sunk by a German submarine. The steamship Hyndford, 2,775 tons, was torpedoed off Beachy Head, March 19th. All of the crew except one was saved. The Hyndford cleared from Puget Sound, September 12th last, with 2,797,760 feet of fir and 709,437 feet of redwood, for Calcutta. At that time the German cruiser Emden was sinking many British merchantmen in the vicinity of Singapore and Penang, and the master of the Hyndford, when interviewed by a Seattle paper, declared he would attempt to ram any German warship that might get in his path.

## Radical Change in Rivers and Streams Law

The bill introduced into the Legislature of Ontraio recently by the Minister of Lands, Forests and Mines in connection with the Rivers and Streams Act has been enacted into law. This bill gives the Lieut.-Governor-in-Council power to declare by proclamation that any river, stream or creek to which the Rivers and Streams Act is applicable shall be under the jurisdiction of the Minister of Lands, Forests and Mines, who shall have power to determine upon application to him by any parties concerned, questions arising in relation to such river, as to the right to construct or use improvements thereon; as to the respective rights of persons using the river for floating timber; and as to the right to interfere with, alter or obstruct in any manner the flow of water in the river. The decision of the Minister in these matters is to be final. The bill also prohibits any person from constructing a dam, weir or other work upon any river except with the permission of the Minister of Lands, Forests and Mines, and under such conditions as he may impose.

If the Minister deems it expedient he may have an inspection made of the river, and name an engineer for this purpose. The Lieut.-Governor-in-Council, upon the Minister's recommendation, may make regulations for the management of such works, according as he considers expedient. The Minister may appoint an inspector to visit such rivers to determine as to the regulation of the use of the water so as to give all parties entitled to it for lumbering, power or other purposes a reasonable and fair opportunity to make use of the water. In cases of dispute as to the use of such works or water the Minister may have an inspection made and then may appoint an officer to be in charge of the river or improvements who shall regulate the use of the river and improvements. When works or improvements upon such a river get into a state of disrepair, the Minister may order improvements to be made by the owner or occupier, and, if the latter neglects or refuses the Minister may have them made at the expense of the person named.

The main effect of this bill is to place the settlement of disputes between parties having diverse interests in the use of such rivers, in the hands of the Minister, whose decision is made final.

## French River Driving Charges

The French Boom River Company, Limited, is making application to the Dominion Government for approval of the following proposed toll to be collected on logs and timber taken down through its works during the season of 1915:—

| | Cts. |
|---|---|
| Section I.—(a) For all logs and timber passing through the works of the company from the Elbow to below rapids at Tramway, for each 1,000 feet B.M. ... ... ... ... ... ... | .05 |
| (b) For taking logs from inside Elbow just above Tramway, and delivering same in rafts to Lake Tugs in their storm booms, and additional charge per 1,000 feet B.M. ... | .40 |
| Sections II., III., IV.—For taking logs from mouth of Wahnapitae, Main French or Pickerel River at LeBoeuf Lake to inside Elbow, for each 1,000 feet B.M. ... ... ... ... ... | .30 |

## Southern Hardwood Sales in Ontario

The first issue of the periodical reports of actual sales of hardwood lumber by members of the Hardwood Manufacturers' Association of the United States has been issued by the Association. The report is compiled by the secretary and contains lists of the actual amounts, sizes and prices, of sales made in the different districts of the United States and Canada which are covered by the Association. The secretary states that future reports will be more complete as reports are now coming in from all parts of the country. It is interesting to our readers to note that the first report contains notice of sales in the Toronto territory covering all points in the province of Ontario east of Lake Huron as follows:—Chestnut 30,000 feet at prices varying from $22 for 4/4 in., sound wormy, to $52 for 5/4 in. and 8/4 in. Fas.; plain white oak, 33,000 feet at prices varying from $42 for 8/4 in. No. 1 common to $62 for 8/4 in. Fas.; 19,000 feet of plain red oak at $60 for 6/4 in. Fas., $62 for 8/4 in. Fas., and $68 for 4/4 in. Fas.; 7,000 feet of quartered white oak, 4/4 in. Fas. at $82; 16,000 feet of rough poplar 4/4 in. Fas. at $57; 4,000 feet of rough poplar, 5/4 in. select at $48; 3,000 feet rough poplar 6/4 in. select at $48; 8,000 feet rough poplar, 4/4 in. No. 1 common at $42, and 3,000 feet of rough poplar, 4/4 in. No. 1 common at $38.

# Montreal Engineers Discuss Dry Rot

## Decay in Timber Recognized as a Serious Problem Requiring Scientific Study—Rosin Content and Density the Chief Factors in Safe Grading

Montreal, April 23rd (Special to the Canada Lumberman):—"Decay in Timber" was the subject of a discussion at the closing meeting of the Canadian Society of Civil Engineers, Montreal, on April 22nd. The subject was discussed from the engineering, botanical, chemical, biological and other points by several speakers, their remarks being illustrated by a large number of fine lantern slides, showing the causes and effects of various forms of dry rot. The attendance was large, and included several prominent local architects, chemists, builders, and many consulting engineers.

The discussion was opened by Mr. Frederick B. Brown, M.Ss., M. Can. Soc. C. E., who said, in part: During the past three or four years there have come into more or less prominence a comparatively large number of cases of decay in timber causing structural difficulties. Timber is and will continue to be used in engineering work to such a very great extent for poles, piles, ties, cribwork, trestles, flooring, sheetings, and for the framework of buildings and other structures that these cases of dry rot trouble seem to call for careful thought on the subject. Every engineer who has been connected with railroad work and pole line construction knows the effect of decay on ties, the butts of poles and other timbers partly imbedded in the ground. The causes are perhaps not so well known nor the reasons why adjacent ties or poles may act quite differently in resisting decay. The details of decay in buildings, however, are perhaps not so familiar to us as engineers, and it is therefore the purpose of this talk to present some features in connection with dry rot in buildings.

### Fungus Growth the Cause of Rot

Decay in wood was formerly supposed to be a slow chemical action something like the rusting of metals, and it was thought that the fungus growths frequently found on timber were there because the wood was already decayed rather than that they were actually the cause of the rot in the wood. Forty or fifty years ago, careful investigators in Europe showed that fungi were the cause of rot instead of the result of it, and the mycelium, or thread-like branches of the fungus, was shown to be capable of penetrating and destroying the wood fibre. There are several fungi which may cause rot in timber. Some of these varieties are now well known to botanists but others are much less so. The action of the same fungus on different woods; and of different fungi on the same wood, is only commencing to be studied, but it is known that the same fungus acts very differently on different woods, and indeed on different parts of the same piece of timber. In addition to the life progress of the fungus through the wood cells, it is quite likely that there is a chemical action, but this is by no means well understood as yet.

The pines, white, red and yellow, are the timbers most usually found in the framework of eastern mill and factory buildings. Spruce and hemlock are also very largely used, but not to such a great extent as the others. Oak beams have also been in the past very freely used. The use of British Columbia or Douglas fir for framework is really only commencing in the east, but it would appear that this magnificent wood will be more freely used in the future, especially when the advantages of the water-borne freight via the Panama Canal will have become well known. A very common form of construction is a framework of yellow pine with floors of spruce. The most noteworthy cases of dry rot in the last few years are concerned with timbers of nearly every variety mentioned. The disease is apparently no respector of species. Neither is its action confined to any one locality. Serious cases are on record in widely scattered places in Canada and the United States.

### Decay in Water Tank Structures

Some four or five years ago we had occasion to examine nearly two score of water tank structures in and about Montreal with a view to reporting on their stability. It may perhaps surprise some of those present to hear that in nearly every instance there were found one or more serious defects in design, construction or condition. Apart from structural defects we found several more or less affected by rot.

One case will serve as an example. In this one the entire wooden supporting framework was badly rotted and so dangerous as to require complete renewal. The arrangement of the structures was such that it was exposed to moisture most of the time, and an ample supply of condensed steam was available for the rot which had penetrated nearly every member. This structure was composed of heavy white pine timbers. A not uncommon trouble was found in tank staves. These are generally 3-in. stock. The heart of staves may be completely rotten without there being any external indication of such a condition.

An interesting case has just come to our attention. A large factory built in 1911 near Montreal has recently been awarded a contract for the manufacture of shells for the war. In examining the building with a view to remodelling it to take certain new machinery it was noticed that the main floor had sagged. Investigation showed a serious case of dry rot, with extensive structural damage. The floor was composed of three thicknesses of 2-in. hemlock planks laid criss-cross and the beams were 12-in. x 12-in. composite members made up of 2-in. x 12-in. hemlock planks spiked together. The floor was laid from two to four feet above the bare ground, and the beams were supported on concrete posts. There was no covering over the ground beneath the floor nor were any openings provided. The entire floor and the beams were rotted and were replaced by concrete.

Another case is that of a mill building. The main mill is a brick building with wooden framework, floors and roof. Taking a typical cross-section of the factory we have a building five stores high about 85 feet wide and about 250 feet long. It is divided crosswise into four bays separated by three rows of columns set about 21 feet apart. On the columns were set 8-in. x 18-in. yellow pine beams in pairs, except in the top storey, where the beams supporting the roof were single and were 8 in. x 16 in. in section. Each pair of beams was made up of two 8-in. x 18-in. yellow pine sticks held 1 in. apart by means of white pine spacers. The beams were fastened together by iron bolts passing through both beams and the spacers.

The columns in the factory were of cast iron in the first or ground storey. In the second, third, fourth and fifth storeys the columns were of yellow pine, square in section, and bored down the centre. In the second storey they measured 13¼ in. square, while in the three upper flats they were 11¼ in., 9½ in. and 7¼ in. square respectively. The flooring itself is the usual form of composite mill construction, made up of 2 in. x 5 in. spruce, set on edge, of random lengths spiked side by side, running at right angles to the beams. The floors are finished on top over a layer of tar paper with 1-in. spruce on which is a hardwood wearing surface. There were twenty-one bents in the building, giving a total of two hundred and fifty-two wooden columns and seven hundred and fifty-six beams. The timber beams and columns had all been covered with a white linseed oil paint on the exposed faces.

### Building Unsafe After Two Years

The first manifestations of rot were noticed about two years after the completion of the building in the sagging of floors, necessitating the shimming up of certain machines. An increase in the deflection in certain parts of the building was noticed, and a careful examination was instituted. It was found that a great many of the beams showed evidences of failures. It was considered wise to put in temporary posts here and there in order to reinforce the beams, and some of these were at once installed. In all, about three hundred and thirty temporary wooden posts were required within the ensuing twelve months, and the subsequent reconstruction of the building showed these temporary columns to have been essential to the safety of the structure in use. Indeed, had it not been for the peculiar continuity and pliability of the mill construction floors, it is quite possible that accidents might have occurred even with this large number of temporary posts. The complete framework of the mill was removed and replaced with other material. During reconstruction careful notes were taken by inspectors who were continuously on the work day and night.

Various degrees of deterioration were found, all the way from a trace of the fungus mycelium to what might be termed complete disintegration of the member. A great many of the beams were so far decayed that they fell into pieces in the process of being removed. Some were rotten to the core, and so much affected that with a crowbar or peavy one could readily break the beam into small pieces. It is doubtful if five per cent. of the whole number of timbers in the building were free from infection at the time of reconstruction.

The mill construction floors over the beams were also affected to a slight extent, but the results were not sufficiently serious to prevent them from performing their duty and they were not removed. It is evident that in this case the resistance of the spruce floors to the attack of the fungi present was greater than that of the pine beams and columns, and the reason for this has been investigated. It is possible that the balance point of spruce with regard to relative humidity is different from that of yellow pine. When the shipment of yellow pine was delivered the remark was made by those handling it that it was a fine shipment in appearance as any. After completion of the

mill any engineer or architect walking through the building would undoubtedly have pronounced it an eminently fine structure, yet within three years the entire framework of this building required renewal.

As a result of our study the conclusion was reached that the timber must have been affected prior to being placed in the structure. The use to which the building was put did not have anything to do with the ultimate result. Other mills have the same form of construction, and being operated in the same way have been in service for decades.

In discussing the timber specifications with dealers and others there appeared to be a difference of opinion as to the exact characteristics of the lumber which should have been supplied. This discussion led to a special study being made of the re-grading of yellow pine lumber.

There are two main considerations in drawing up a specification for timber, one is durability and the other structural strength. A piece of timber may have the necessary structural strength and have very little durability. In drawing up specifications where durability is of prime importance it is therefore necessary to choose between high grade timber or to pay for the treatment of an inferior quality of stock. Where structural strength is of prime importance the choice lies between high grade timber of a certain size or a larger quantity of timber of a lower grading.

### The Grading Problem

The ordinary grading in use up to a year or so ago apparently did not take into consideration all the factors necessary for durability and strength. The gradings for yellow pine were apparently designed to meet the requirements of the lumber dealers. During the past year, two or three specifications have appeared which indicate that the requirements of the user as to durability and strength can be met.

Our researches convinced us of the necessity for describing timbers on a different basis from that formerly in use. We found what appeared to be a somewhat definite relation between certain of the physical characteristics of the beams and columns in this mill with regard to resistance to decay. The timber varied from very coarse-grained, having as few as three growth rings per lineal inch measured along the radius of the section, to fine-grained beams having as many as twenty rings to the inch. The finer grained beams generally showed a higher resistance to decay than the coarse-grained, but this was not universally so. In some cases the fine grained beams had a comparatively small percentage of dark summer wood, and these were more affected than a highly resinous coarser-grained piece. Sapwood was found to be very susceptible to rot, but on the other hand, heart wood was not entirely immune. Summing up all of the data we were able to collect, we concluded that the rosin content has a great deal to do with theh resisting power of yellow pine. Generally speaking, those sticks which were dense and showed evidences of considerable rosin were much more resistant to the fungus attack than the lighter wood even if fine-grained.

Dr. Carrie Derick, of McGill University, dealt fully with the botanical and biological sides of the question, explaining the structure of the woods, the various forms of fungi, and how the fungi affected different kinds of timber. Miss Derick also explained the methods by which the fungi spread, and the linking of certain species for various food materials. Good lumber used under proper conditions was an excellent building material, but it was perfectly useless to use poor lumber under circumstances where it was subjected to great strains.

Mr. F. J. Hoxie, Engineer and Special Inspector of the Associated Factory Mutual Fire Insurance Companies, Boston, remarked upon the stress some people laid upon ventilation in regard to dry rot. He pointed out, however, that it all depended upon the kind of ventilation, and that in some instances ventilation had encouraged, instead of retarded, the growth of fungi. Air taken from near the surface of warm, moist ground into a cool basement would prove worse than useless as water would be precipitated from it on to the cooler woodwork making it wetter instead of drier. Mr. Hoxie emphasized the importance of relative humidity in its relation to the growth of rot, and then alluded to the question of piling. He showed a picture of a Canadian lumber yard where the manufacturer used concrete bottoms for piling lumber. Some lumbermen, he said, were under the impression that any old lumber was good enough for use in piling, and this was the cause of a considerable amount of infection. Other pictures illustrated tanks for treating lumber before piling, a method which had been proved to be effective. The percentage of rosin and the density were most important indices to the resisting power to decay in yellow pine. Mr. Hoxie concluded by pointing out the danger of using unsuitable lumber in mill construction.

### Rot In Mining Timbers

Dr. J. S. Bates, Superintendent of the Forest Products Laboratories of Canada, stated that the laboratories had recently undertaken a general investigation of Nova Scotia mine timber. They had received from mine owners shipments of timber with a view to determine the relative strength of the various species. Specimens of black and red spruce and balsam fir were obtained. When they started to make the tests it was found that the timber was infected with fungi, which, of course, affected the strength of the timber. The results showed that only forty per cent. of the 288 sticks were sound. Some mine owners wondered why the timber rotted so quickly. The investigation showed that some of the timber was rotting before it was put into the mines. As the result of the tests, it was found that the strength of the timber had decreased from 15 per cent. to 30 per cent., even with very little difference so far as the deterioration was concerned. Enquiries elicited the fact that some of the pit props were not properly stored in the yards, and that they had absorbed a large quantity of moisture; there was also a considerable amount of rotten wood in the storage yard, which afforded excellent food for the fungi. Dr. Bates announced that the Department were undertaking experiments to determine the relation between moisture in lumber and the pressure of humidity in the surrounding air.

Mr. J. A. Jamieson referred to decay in timbers used in building grain elevators. His experience was that wood cut and placed in buildings in a very damp condition decayed rapidly; while in one case wood left to dry for twelve months was in an almost perfect condition after having been in use for twenty-five years. He asked how it was that in some instances the decay was found in the heart of the timber while the outside was sound?

Miss Derick replied that some trees were infected by reason of the wounds made through the branches being broken, allowing fungi to enter the heart, and still other timber was infected after it was cut, since in some species heartwood is more susceptible than the outer portions of the tree.

Dr. Porter, of McGill University, suggested that dry rot had increased of late years. He thought that this was due in part to the fact that years ago portable mills were more in use; now the establishment of large mills formed, as it were, fungus beds.

Mr. Hoxie was of opinion that the increase of rot cases was due to a certain extent to the kind of lumber which was now used. He pointed out that the supply of long leaf pine was not so reliable as it was in the past, and that loblolly which formerly was rejected, was now being used in increasing quantities.

Mr. Walter J. Francis (the chairman), in closing the meeting, declared that wood was an excellent building material; probably 90 to 95 per cent. of the structures in which lumber was employed were satisfactory. Dry rot was very insidious in its operation, and the object of the discussion was to interest engineers in the subject, which was of growing importance.

The question of timber treatment was left for another meeting.

## Question and Answer

Editor Canada Lumberman:—

We would like to have information as to what percentage of the exports of lumber from Montreal during 1914 was white pine and to what countries this white pine was shipped. Do you know whether there is a market in the mother country for white pine selects for factory purposes?

The best information we can obtain is to the effect that approximately two-thirds of the exports of lumber from Montreal, as shown in our issue of December 15th, 1914, was white pine. It is impossible however, to state the exact figures as various shipments of different firms are lumped together, including pine, birch, spruce, and various other kinds of lumber. The white pine was shipped principally to the United Kingdom, but some of it went to South Africa, also to Harve, Antwerp and one or two other European ports. By far the greater portion of it however, was shipped to the United Kingdom. We are also advised that there is no market in the Old Country for white pine selects for factory purposes. In fact, one of the largest exporting firms in Montreal advise us that you could hardly give this stock away in England.

---

Editor Canada Lumberman:—

Will you give us information in regard to the stamp tax upon "time cheques"? We pay our men in the woods with these cheques. They are payable at the head office of our company in Toronto. The men often hand them over to local merchants when they are buying goods. The merchants cash them and send them to a bank. Through the bank they finally reach our head office. Must we put stamps on these "time cheques"?—Logging Manager.

We are informed by the Finance Department at Ottawa that these so-called "time cheques" are "bills of exchange" and are not strictly "cheques." The company issuing them does not, then, require to place a stamp upon them, but the party who transfers such an instrument to a bank must place a stamp upon it, at or before the time he negotiates it.

# Electricity in the Lumber Industry

## An Account of the Rapid Development of Electric Drive to Logging and Manufacturing Operations—Typical Installations Described

By E. F. Whitney*

From the trimmers, the stock passes over chain conveyors spaced 4 ft. (1.22 m.) apart, to the sorting table, where it is graded and removed for placing in yard stock, treating in the dry kilns preparatory to further finishing, or to be returned to the mill for further reworking.

The sorting table consists of several chains or cables running at about 15 to 30 ft. (4.58 to 9.15 m.) per minute. The starting requirements are heavy, since the mass to be accelerated is very large. A friction device is invariably placed in the speed-reducing transmission machinery, however, which relieves the motor from all starting strains and allows a squirrel cage type motor to be used for the drive.

The motor is semi-exposed to the weather, and in its manufacture, this fact should be considered. The running load is fairly light and practically constant. A motor with polar-wound rotor, back-geared shaft and chain drive from back-geared shaft direct to table driving sprocket, will eliminate all of the transmission machinery. This scheme has not met with general success, however, due to the very severe starting strains as compared with the running load. The table itself should be of such length that sorting for both dimensions and lengths can be accomplished without too great congestion at its end. The power requirements for an average case are about as follows:

Motor, 10 h.p. back-geared 850 to 128 rev. per min.
Chain drive from back-geared shaft.
Drives 1596 ft. No. 75 chain—Chain weight 3445 lb.
Lumber per hour—12,000 ft. b.m.
Speed of first section 35 ft. per min.—decreasing to 29 ft. on last section.
Maximum noted load running ..... 7.5 kw.
Average load running ..... 5 kw.

### Re-Saws

These machines re-work stock which has not been cut to its ultimate thickness at the first operation. Fig. 14 shows a six-inch vertical re-saw which is direct-connected to a 75-h.p. motor. The starting duty is heavy, due to the weight of the lower wheel and the inertia to be overcome. It is therefore common practice to use a squarrel cage motor with substantial end-ring construction and resistance rotor. When running, the tension wheels serve as an equalizer, reducing the peak demands. The feed rolls are sometimes operated by an individual motor, and in a re-saw of this size, approximately 10 h.p. is required for them, the feed roll motor being a standard squirrel cage machine.

The following are typical service data of a heavy-duty band re-saw:

Rate of feed ..... 185 ft. (56.4 m.) per min.
Splitting, 2 in. (5.08 cm.) by 12 in. (30.48 cm.)..... 80 kw. input
4 in. (10.16 cm.) by 10 in. (25.4 cm.) ..... 60 kw. input
Running light ..... 16 kw. input

Horizontal re-saws are becoming more popular because of the ease with which they may be instantly adjusted to care for stock of different dimensions. Such a machine can, for instance, handle on one side of its adjustable bed a 6 in. by 12 in. cant, re-sawing to 4 in. by 12 in. and 2 in. by 12 in., and on the other side at the same time re-work a 2 in. by 8 in., making two 1 in. by 8 in. boards. The start ing duty is about the same as for the vertical type. The running load fluctuates no more widely.

Gang saws, as the name implies, consist of a number of straight crosscut saws which split a cant at one operation into a great number of boards of the proper thickness. The boards then proceed to the trimmer and are cut to length, as with the output of the edger. These saws have a vertical reciprocating and oscillating motion and the machine is equipped with a flywheel to equalize the load. The average size gang requires a 75-h.p. motor.

A rip saw is required to reduce the width of a certain amount of the mill run, according to order demands. Fig. 31 shows a rip saw, rolls and transfer to rip saw from first section of sorter chains. A silent chain drive or a direct-connected motor may be used. Either method operates satisfactorily, the particular drive adopted depending on the mill layout and space available.

Rough timbers often require no further sizing work than can be performed by the head saw, and never more than an additional passage through the edger. They are conveyed directly to the tail end of the mill, where the ends are squared by a large cross-cut saw—and then proceed to the loading platform. Sometimes, however, for uniformity of alignment in building operations one or more sides must be planed after the timbers have been squared at the end, and consequently they go to what is known as the "green" mill. This consists of one or more planing machines, with an exhaust fan to dispose of the shavings. The planers ordinarily used for this work are known as "ready sizers," a machine which is quickly adjustable for different size timbers and is arranged to surface only an edge and a side, and "timber sizers," which ordinarily have four cutting heads and can surface all four sides of the stock. The average power requirements of such a machine are as follows:

For transferring cants from the main rolls past the head saw to the storage platform in front of the gang saw, an overhead crane transfer is provided (shown at top of Fig. 16). The hoisting and propelling motors are series-wound, direct-current machines, and are supplied from a motor-generator set.

### Refuse

The refuse from the various sawmill manufacturing processes consist of dust from the saws, edgings, trimmings, and shavings from the "green" planers. V-shaped troughs in which chain and block conveyors run, serve to handle the sawdust from the main mill machines, but from the planing machines the shavings must be carried away from the knives as fast as possible, so that some pneumatic suction system is necessary. The edgings are first run through a gang of crosscut saws, a "slasher" with saws spaced 4 ft. (1.22 m.) apart. See Fig. 17. These slabs fall directly into the main mill wood conveyor, which has already received the stub ends from the trimmer which were less than 4 ft. (1.22 m.) long. From this conveyor, Fig. 18, is taken the stock for the lath mill and wood saws. The waste which is suitable for neither of these purposes, continues to the "hog" and the refuse burner. The "hog" hashes the refuse into small pieces suitable for use under boilers, after which it is conveyed to the fuel storage bins. These appliances run at constant speed, and have fluctuating demands.

Dust from the machines is dumped into a main sawdust conveyor,

which in turn delivers into the conveyor at the fuel bins. The shavings from the sizers are lifted by suction to a collector and from here blown directly to the fuel bin. Piping is usually large, because of the tendency of sawdust, if at all damp, to pack tightly at bends. Low pressures such as can be delivered by centrifugal fans are the rule. The pressure seldom exceeds 5 oz., but the volume is constant and consequently the blowing system is quite extravagant of power. The sawdust and hog fuel from the saw mill, planing mill, etc., if used for generating steam, is more than ample for the total power requirements of the mill.

Refuse consumers are a source of large expense to the mill operators. They must be substantially constructed; at the base, they are lined with fire brick, and sometimes they are water-jacketed to quite a height. For a mill with a capacity of 150,000 ft. b.m. per day, the upkeep expense of a $10,000 burner would be approximately $1,200 for interest and depreciation, and $1,000 for maintenance. The life of an average burner is about ten years.

### Handling

From the sorting table the lumber is placed in bundles ready for handling. The most efficient method where location permits, appears to be by the well-known overhead monorail (Figs. 19 and 20). The cost of handling by this method averages about $0.10 to $0.14 per M. ft. b.m., which includes all expenses in connection with the system after the bundle is picked up until it is placed in the storage yard or deposited at the dry kiln. This cost covers all charges against the system for labor and operating.

The first cost, installed, of such a system is $4.00 to $5.00 per lineal foot of track, including the hoists, and it provides about 2,000 ft. b.m. storage space per foot of track. The monorail is usually operated by direct-current power at 250 volts, requiring a motor-generator set or small direct-current steam-operated set. The cost of handling with trucks and horses is approximately 25 cents per M. ft. The horses are giving way, however, to storage tractors, with the result that the above cost is reduced to approximately 10 cents per M. ft. for average distances of handling.

(to be continued)

## Pulp and Paper People Object to Freight Increases

During a recent session of the Dominion Board of Railway Commissioners at Ottawa, Mr. Arthur D. Huff, Montreal, traffic expert of the Laurentide Pulp & Paper Company, protested against the proposed increase in freight rates on pulp and paper. When the war is over, Mr. Huff said, the products of pulp and paper mills in Scandinavian countries which are now tied up owing to the disorganization of trans-Atlantic shipping would flood the United States market, which was Canada's best market, and Canadian mills would have to curtail their output or shut down, and some of them would come to financial trouble. Owing to misapprehension in regard to the alleged huge profits in the pulp and paper business, companies were springing up like mushrooms in Canada. At present there was over $100,000,000 invested in the industry and $10,000,000 paid annually in wages. The growth of the industry was greatly in excess of the requirements and consequently there was a great surplus of production over consumption, with prices lower than at any time since 1909, although the cost of material and labor was higher. Mr. J. F. Orde, K.C., told the Board that the paper department of the E. B. Eddy Company, of which he was a director, made no profit at all last year.

---

Mr. H. R. MacMillan, Chief Forester for British Columbia, passed through Toronto recently on his way to Ottawa. Mr. MacMillan left a few days later for New York to take passage for Great Britain. This is the first stage of Mr. MacMillan's trip around the world as a trade commissioner for the Canadian Department of Trade and Commerce. It was expected at first that Mr. MacMillan would make his trip in the other direction visiting the Orient and continuing westward. Subsequently, however, it was decided that the better plan would be to visit Great Britain first and continue to France, South Africa, India, etc.

---

Wm. Disston, president of Henry Disston & Sons, Inc., Philadelphia, the long established and widely-known firm of saw manufacturers, died on April 5th, at the age of 56.

# Trade News From Maritime Provinces

## Sailing Vessels Helping to Relieve the Scarcity of Tonnage—Interesting Reports of Progress of the Drives.

Some forty years ago, or about the time of the Franco-German War, steamers very seldom carried wood, says The Timber Trades Journal, of London, Eng. Sailers were considered sufficiently speedy and quite good enough for timber cargoes. Gradually, however, the windjammer was ousted in favor of the quicker transit, and the sailer has now become in ordinary times the exceptions, and employed only for small cargoes from Norway or to minor ports. The present scarcity of steamers, owing to the war and the high freights of 100s. or 120s. a standard, has attracted sailers back to the timber trade, and considerable numbers have been chartered for the pitch pine and spruce ports. The St. John Telegraph describes the Miramichi River as now a veritable forest of masts, the lumber firms have been seeking sailing vessels far and wide to undertake the carrying trade, and one firm alone has thirty three-masters and barquentines chartered to handle its output during the coming season. The lumber cut on the Miramichi this year is larger probably than ever before, and has been yarded without difficulty, so that if stream driving proves favorable the output of the Miramichi mills will be above the average and will all be shipped by sailing vessels, there being no steamers available. These sailing vessels, gathered for the transatlantic trade, have hitherto engaged in coastwise lumber carrying and general freighting business, but the high freights will make the change very profitable, and the same condition will probably apply to the lumber trade from St. John and Bay points.

### Sailing Vessels Carrying Lumber From Halifax

An example of the way in which sailing vessels, square-riggers included, are benefiting from the prevailing high rate of freight was given in Halifax harbor recently when three large Norwegian barks from across the Atlantic sailed into port and unaided came to an anchorage behind George's Island. Before night fall a fourth bark had passed Chebucto Head bound in, and early in the evening another square-rigger was reported about five miles off the Head. Five barks arriving at Halifax in about as many hours is sufficient evidence of the boom that the war has caused for sailing ships. All five vessels came to load deals for England. As each ship came in she passed the Norwegian bark Cimba, which lumber-laden, was towed out of the harbor to sea and was soon under sail for England.

Fifteen Nova Scotia schooners and one Nova Scotia bark are at present engaged in the deal carrying trade to the United Kingdom. Many schooners are expected to load at Bay of Fundy ports for England this summer.

### Eastern Nova Scotia Association Formed

A meeting of lumbermen of Eastern Nova Scotia was held at the Learment Hotel, Truro, N.S., on April 20th, to form an organization to be known as "The Eastern Nova Scotia Lumbermen's Association." The following officers were elected for the ensuing year: President, I. J. Soy, Amherst, N.S.; Vice-President, C. C. Glennie, Oxford, N.S.; Secretary-Treasurer, D. M. Smith, Truro, N.S.; Executive: I. J. Soy, C. C. Glennie, D. M. Smith, C. H. Reid, Amherst; C. C. McNeil, Oxford; J. H. Hickman, Port Elgin; B. H. Dunfield, Halifax; Walter Bragg, Collingwood Corner; J. H. Livingston, Wentworth. There was a large attendance of the prominent operators at the meeting, showing the wide-awake interest that is being taken in the welfare of this industry.

### Randolph and Baker Mill Newly Equipped

Randolph and Baker, St. John, N.B., the well-known manufacturers of lumber, have recently made important alterations to the equipment of their plant. They decided last year to discard much of their former equipment and they have now installed equipment furnished by the Berlin Machine Works, Hamilton, Ont. The plant now includes the following Berlin equipment:—

Log deck machinery; log kicker and loader, steam nigger and deck rolls.

Saw mill carriage with full equipment for single or double cutting band, 11 x 14 in. twin engine steam feed.

One-eight inch Berlin Double Cutting Band Sawmill.

One 7-ft. Berlin horizontal band resaw, with divided roll bed, roll equipment front and back with transfers to edger and live rolls. The mill has also two edgers.

One 5-saw slasher with extension chains.

One 2-saw lumber trimmer of the New England type.

Full outfit of live rolls.

Full equipment of transfer chains to the various cutting units.

A special assorting chain device behind the trimmer, arranged to deliver stock automatically to yard rolls running at an angle of about 60 degrees.

A full equipment of filing room tools for the proper up-keep of the bandsaw and band resaw, as well as of the circular saws required for the mill's equipment.

Transmission machinery necessary for operating the various machines.

The estimated output of the mill with its new equipment is between 80,000 feet and 90,000 feet per ten hours for the class of lumber upon which it operates.

### New Charter Party Proposed

At a recent meeting of the Maritime Shipowners' Association held at Halifax, N.S., it was suggested that a standard form of charter party should be adopted for coastwise lumber voyages, calling for vessels to be loaded as fast as possible, and to be received by consignees at the rate of not less than 40,000 superficial feet per day (holidays and Sundays excepted). No definite action was taken in regard to this matter.

### Extensive Orders from Cuba

A despatch from Truro, N.S., states that Mr. J. E. White, from Havana, Cuba, who is now in Nova Scotia, has purchased 5,000,000 feet of spruce in New Brunswick for the manufacture of packing boxes, and is now in Nova Scotia looking after 3,000,000 feet more for the same purpose. Mr. White says that the Cuban sugar crop is unusually large this year, but the tobacco markets, England, France and Germany, are almost closed to them on account of the war.

## News From the Drives and Mills of the East

A report from Bridgewater, N.S., states that water in the streams has been exceptionally low this spring, and that lumbermen have been seriously handicapped in their driving operations.

A report from New Glasgow, N.S., states that although the winter was a poor one for logging operations there will be four steam mills and one gasoline mill operating at Country Harbor this summer.

Mr. John A. Morrison, Fredericton, N.B., reports that driving operations have been started on all the small streams running into the Upper St. John River under most favorable conditions. Reports of driving operations on the Nashwask River are also very favorable.

A report from Scotstown, P.Q., states that driving conditions on most of the small tributaries of the Salmon River have been good up to date this season, and that the volume of water is likely to continue fair for some time. There was very little snow left when the mild weather commenced and so a little more rain is needed than usual.

It is expected that there will be no drift drive on the lower St. John River this year. Only about two thousand pieces went down with the first ice run and a good many had got adrift, while the others were mostly logs which had been under Grand Falls since early last season and could not be extricated. Men with row boats and motor boats went out on the lower river catching these logs and none of them are expected to be lost.

The main body of ice in the St. John River started running out this year about two weeks in advance of the date in 1914, when it broke up on April 27th. The river was clear of solid ice this year below Grand Falls at the end of the second week in April. The ice was then still solid above Grand Falls. With the main river clear of ice the river steamers commenced their trips and the St. John River Log Driving Company began placing their booms.

Bank logs have advanced fifty cents a thousand superficial feet and are in strong demand at Springhill, N.B. Only about fifty joints had

arrived there by April 21st and they were largely logs that were already contracted for. Buyers have been bidding briskly for all logs on the market with the exception of hemlock, which are not as good sellers, because of the American market being somewhat off. Quotations were $15 for merchantable spruce and $11 for battens, with hemlock and hardwood selling from $9 to $10.

A despatch from Scotstown, P.Q., under date of April 21st reported that continued fine and cool weather had set back the lumbermen a great deal, as there were a number of gangs of drivers being held up in the woods on account of lack of water. Comparatively little snow fell in the woods during the past winter and this has made the usual spring supply of water very much less than in former years. The chances of any increase in the supply of water did not seem to be good. The Salmon River near Scotstown fell over five feet in a few days.

The first new logs from the Upper St. John commenced running past Fredericton on April 20th. Among these were new logs for Stetson & Cutler, St. John, from the Seven Islands District and new logs from the Allegash. The booms of the St. John Log Driving Company were all swung on April 19th, but the run of ice and logs were so heavy that they had to be swung open and a considerable quantity of logs went past the booms. Steps were taken to catch these logs further down the river. The water in the river on April 20th was about five feet higher than when the ice ran out.

A despatch from Fredericton, N.B., under date of April 21st stated that the St. John River Lumber Company's booms at VanBuren, Me., had been put out and the sorting gaps would soon be at work. Logs were being sent out into the main St. John River from the Braley, Turney, Baker Branch and Southwest streams, the water being at a fair pitch for driving. Other reports from up river stated that the water was rising at VanBuren, but on the lower part of the river, the water was falling due to cold weather and heavy winds. All over the province large crews of river drivers were being sent to the streams, and driving operations were in progress in every section.

## Reducing the Cost of Woodworking

Foremen, managers or superintendents, upon taking charge of a strange shop, are confronted with several serious problems, the worst of which is, "What to do, and what not to do."

It is very hard to even imagine a more trying position for a man to be placed in than to be suddenly thrust into the management of a large woodworking plant, with the owners and directors all standing by in expectation of great things from the new manager or superintendent. It is a very hard position to be in, and for the time being it is almost impossible for the new official to determine what his best course should be.

In a case of this kind, perhaps the best thing to be done is to do nothing—that is, make no changes in the personnel or the methods under which the shop is being operated. The inertia of a woodworking shop will keep it moving while the new head is getting his balance, and, unless a previous course of study and well-formed plans have determned the proper course of procedure, the very best thing for the new manager is to do nothing.

In a few days, things will begin to shape themselves, the new head will see things one or two at a time, where the knife is required, and he can apply it gently and steadily until the necessary cuts have been made.

One of the very worst things which a new manager can do is to start in with a whoop and a holler, and give the idea that he intends to turn the factory, if not the world, upside down in about fifteen minutes. The new manager will lose nothing and gain a great deal by taking the gentle course. The workmen are always on edge when a new head is placed over them, and they are either working at high speed or they are in the sulks, expecting a grand turnover, and caring little what happens. The latter condition usually prevails when the new manager "pulls her wide open" the instant his hand touches the throttle. Things become chaotic in the shop, and efficiency and output are alike reduced almost to zero.

But how much different are things when the new manager begins with the "soft pedal!" He lets the foremen run their several departments just as they have been doing and the work moves along as though nothing new had happened. In fact, the work and products are usually above the average, owing to the fact that the men are "keyed up" to their highest pitch, and are doing their best while trying to "size up" the new manager.

Then as the new head becomes acquainted with the peculiarities of his shop, let the work of cost reduction begin. A little change here, a new operation there, the planning of work so that a machine operator can perform the operation instead of its necessarily being done by an expert operator—those are the quiet ways in which the cost of woodworking is to be reduced.

Sometimes the superintendent is obliged to establish an entirely different route for the material as it passes through the shop. The rearrangement of a machine or two, or of seevral machines, may be necessary to provide a straight line of progress for the material. The manager will very quickly find that every degree which work-progress deviates from a straight line through the shop in an addition to the cost of woodworking.

Acting along these lines, the manager will find that the secret of low cost production hinges upon a three-fold requirement. First, each machine must be kept in operation full capacity all the time. The measure of a shop is the capacity of its machines, and the only way in which the shop can make money is by a percentage of profit upon the material which passes through the shop and the several machines. Hence the necessity for each machine to be in operation every instant of time.

The second requirement is the supplying of stock to the several machines, i.e., feeding them, with as little expense as possible. Here comes in the "straight-line" method of progressing material through the shop. Closely connected with this progress of stock is the matter of labor efficiency and useless work which is being done in the shop. This matter may be well illustrated by watching two men pick up blocks and throw them into a truck. One man picks up a couple of blocks with one hand, puts them into the other hand and then throws them into the truck. The other man picks up blocks with both hands and throws them aboard without making an unnecessary motion—all useless labor is eliminated, and that is the problem the superintendent has to wrestle with, to solve if he can, and to tolerate as best he may, bearing in mind that so far as the men deviate from the single-motion method so far will the shop profits fall short of "what they might have been."

The third problem of the superintendent's problem is the condition of the machines. Unless they are constantly maintained at the very top-notch of working efficiency, there must be a corresponding loss in shop profits, for, as before stated, the sole source of shop revenue is in the amount of quality of the work turned out by the several machines. A dull knife here, a slipping feed-belt there, may reduce very appreciably the quality as well as the quantity of the output, and it is up to the cost-reducing manager to keep these machines keyed up to their fullest capacity each and every minute of the day

The above is one most excellent method of procedure for the new superintendent upon taking charge of a new and strange shop. But occasionally the methods described above fail to work. The older workmen may have gotten so deeply into the ruts of habit and routine that it is impossible to teach them new habits. In this case, the cure is apparent and simple. Just get a new man, and a young one, who can be taught the new and improved methods of doing work.

It is well, when possible, to take charge with the "soft pedal open" as described above, and then gradually weed out the poor men and poor machines. This course does not paralyze production as it does when a new superintendent jumps in with his coat off and tears up everything before he knows what the conditions really are. But when it is found that the "soft pedal" method is not bringing results, then a radical change is in order. Things must be ripped up, but a complete turnover must be ripped up, but a complete turnover then will not stop everything as it would before the new management had become acquainted with conditions and knew how to meet them. Sometimes the rooting out of a few men, perhaps a foreman or two, will be all the change necessary, and make all the difference in the world between slipshod, desultory work and the snap and vim of top-efficiency shop operation. The wise superintendent seeks the cause of high cost of production in his shop, and roots out those causes along the lines of least resistance, be it by the slow "soft pedal" method or by a "cleaning out" of the entire shop force and the hiring of new workmen.—J. S. in Wood Craft.

## New Rate on Unrossed Wood Refused

The Board of Railway Commissioners has issued judgment refusing the application of E. W. Roberts, of Montreal, for the establishment of a special winter freight rate on rough, unpeeled pulpwood by Canadian railways. This matter has been before the Board for some time. The applicant pointed out that while the green, unrossed wood weighed about 5,000 pounds to the cord, the rossed wood weighed approximately three-fifths of this. He stated that there was a large amount of unrossed wood which was owned by operators of small means who were unable to obtain capital to cut and ross the wood and wait until it was sufficiently seasoned, and he was thus of the opinion that a special rate on unrossed wood would be justifiable. He therefore asked for a special winter rate on the unrossed wood to be applicable until May 10, the rate to be exactly the same per car as a similar car lot of rossed wood would amount to during that period. Roughly speaking the seasoned wood, when loaded to the minimum of an ordinary car, would represent 10.3 and 11.2 cords respectively while the unseasoned wood would represent 7 and 8 cords respectively.

# Canadian Lumber Competition in the United States

Under the title of "Canadian Lumber Competition" an interesting article is published in a recent issue of American Forestry, contributed by Mr. H. D. Langille, of Portland, Oregon. In the course of his article Mr. Langille writes as follows:—

In normal times log values are the same in the province as across the line; and as a general statement it may be said that the difference between log cost and log value, which is stumpage, including royalties, is about the same for logs of equal quality. In each territory original purchasers acquired timber at prices which are almost negligible in the cost of logs but latter-day buyers in British Columbia have been required to pay as much for timber of equal log value as is paid in the United States. There is but little, if any, foundation of fact in the statement often made by operators in the United States that our neighboring manufacturers can sell for less because their timber is cheap. Timber that the market of these years will absorb is not comparatively cheap in the log.

The initial cost of logging equipment and maintenance is higher in British Columbia than in Washington or Oregon owing to heavy import duties. Supplies and woods labor are higher and the labor, as a rule, is less efficient. The provincial laws prohibit employment of Oriental labor in provincial forests or on public works, and the standard government wage fixes a high rate for all labor. Eighty per cent. of the donkey engines and blocks, etc., is made in the United States. The wire rope comes from England, while saws and small-mill machinery is mostly made in Canada. Large mills use American-made burners, bands, gangs, log-deck and electrical machinery. The proportion of American-made goods is decreasing but Canadian prices are based on American prices, plus duty. A comparison as between wage scales of mill and woods workers shows that wages in British Columbia are about 10 per cent. higher than in Oregon. Considerable Oriental labor is used in the yards but its cost, per unit of production, is equal to that of the labor employed in the western States.

The climatic conditions are similar except that the heavy rains of the northern coast cause more loss of time in the camps. Cutting is less advanced amid the intricate system of interior waterways in the province, hence the haul to water is shorter. The conditions are similar to those which prevailed along the Puget Sound and Columbia River in the days of small loggers. The waterways may offset in a measure the disadvantages alluded to but small operations cannot be economical and the day of the hand logger has passed. It is generally claimed by provincial loggers and manufacturers that operations in the province cost 20 per cent. more than in the United States; and this is unquestionably true in the inter-mountain districts, at least. It is the log value at points of manufacture that counts in a discussion of competition and this has been shown to be equal; excepting that in the United States log prices of water-borne logs are made as at booms, while in the province they are usually for logs delivered at points of manufacture.

With its wealth of good cedar British Columbia is able to produce enormous quantities of shingles. Unopposed by restrictive duties it may easily capture the shingle business of the United States where the supply of cedar is comparatively limited. The province also bears an immense amount of pulp timber and water power for its development. One paper mill is now producing 225 tons daily. A sulphite fiber plant is producing 40 tons of fiber per day. "A small portion of this suffices to supply the provincial market, while freight rates prevent the shipment of newsprint to points east of Alberta. A small quantity of newsprint is shipped to be distributed from Calgary and Edmonton, the balance (comprising over 75 per cent. of the output) being marketed in the Northwestern States. About 25 per cent. of the sulphite fiber is sold to paper mills in the same market." This in the face of the fact that pulp logs in those States cannot be sold for enough to return the cost of logging. The first shipment of wood pulp from British Columbia to the Atlantic coast was consigned to New York in September of this year.

## Canadian Markets

In 1911 the population of Canada was 7,207,000. The five western provinces, with an area of 1,723,700 square miles, had 1,321,748 people, or less than the present estimated population of Philadelphia. But during recent years there has been an unparalleled influx of settlers into that territory seeking homes on the boundless prairies within the range of grain production. A great boom was experienced. Railroads were built and towns followed. The vacant places were sparingly peopled. As a result an enormous demand for lumber was created—greater per capita than was ever before known. To the west was the almost untouched forest reaching to the sea and the government invited its exploitation. Plants sufficient to supply the normal demands of ten million people were erected in frenzied haste to supply one and one-half millions.

Then, by 1913, immigration practically ceased. Stagnation followed inflation and in rapid succession the mills went down, leaving capital and labor unemployed. In 1910 there were 225 saw mills in British Columbia with a daily capacity of 4½ million feet. In 1912 it was estimated that $52,000,000 of American capital was invested in mills and timber in the province. There are now about 365 saw mills and 61 shingle mills in British Columbia and in 1913 they cut 1,515,828 thousand feet of lumber and about 480,000,000 shingles, raising the province to first place in the Dominion as a lumber producer. In 1909 it produced only one-fifth of the total cut of Canada.

So great was the consumption of lumber in the prairie provinces that besides four-fifths of British Columbia's output that market absorbed 479,169,300 feet of lumber, 121,940,000 lath and 90,093,000 shingles imported from the United States during 1911 and 1912. It was a dumping ground for low-grade lumber from the Inland Empire. No effort was made to develop a foreign market. When the slump came there was distress.

Eastern Canada has an important trade with foreign countries and its relations with the eastern United States are fixed. The problem of overshadowing moment is what British Columbia shall do with the products of its surplus of mills.

Through time beyond reckoning the prairie provinces will be large consumers. Settlement and wheat growing will reach northward to latitude 55 degrees and the sparsely settled districts will fill with farms, but the abnormal demand of the years just past will never develop again. Years may pass before the capacity of today will be reached. In the meantime the capital invested cannot remain unproductive. Impatient of returns from timber new mills will be built. As in the United States, government will look to its forest for revenue, encourage waste and aid in destroying the industry by selling whenever and wherever it can on terms which foster incompetence and invite affliction.

With capacity to supply ten millions of people and one and one-half millions to supply, the manufacturers are seeking to know what they shall do to survive. The answer must be found among ten millions of people outside of Canada. Lumber is a bulky product. Its best market is that nearest the source of supply; hence Canadian manufacturers turn to the one hundred millions of people across the line—the most prodigal users of lumber in the world. The tariff bars are down, international railroads have reduced their rates to equal those of all-American lines; the way to a market is open and buyers in the United States may now rejoice at the spectacle of a demoralized industry struggling from both sides of the boundary to increase consumption by cutting prices to or below cost of production. The day of Canada's retribution dawned on October 3, 1913, when the Underwood tariff took effect.

During the fiscal year ending June 30, 1914, 472,245 M. feet of lumber worth $11,481,431 was exported to Canada from the United States and there was received in return 892,833 M. feet worth $16,936,930. In the last nine months under protective tariff British Columbia sent into the United States 1,861,100 feet of lumber, while during the first nine months of free trade the shipments amounted to 12,030,799 feet, an increase of 546 per cent., but withal not an alarming amount when compared with shipments into the prairie provinces from the United States during 1911. During the first eight months of 1913 importations of Canadian shingles amounted to 288,047 M., valued at $743,030; while during a corresponding period in 1914 the importations amounted to 765,627 M., worth $1,776,930, an increase in volume of 139 per cent. Of the 765,627,000 shingles imported this year 201,842,000 were shipped from British Columbia through the Puget Sound gateway, as compared with 30,706,000 received through the same gateway during the first nine months of 1913 under a protective tariff. This indicates the ascendency of British Columbia shingles over those made in Washington and Oregon. The total value of all wood products imported into the United States from Canada in the year ending June 30, 1914, was slightly less than that of 1913. Only a profitless market, over-production and general impoverishment of the industry in the United States will prevent heavy importations this year. The British Columbian manufacturer cannot compete successfully with present prices.

A notable difference is found as between the attitude of government in Canada and the United States. In Canada, and particularly British Columbia, a partnership has been established between leasees

and actual owners. Parliament aids in developing industry at home and abroad. In the United States, Congress authorizes the expenditure of a million or two of dollars that a mythical, impossible trust shall be sought for. Canada is seeking preferential tariff relations with her sister countries of the empire, seeing in them parts of the ten million consumers she needs. The time is opportune for trade extension at home and abroad and with the return of normal conditions in the United States the wheels of industry will again turn in the province, prolonging the idleness of labor and capital from which the northwestern States are now suffering.

British Columbia will not hope in vain for an American market. The Panama Canal and our shipping laws invite participation in the trade of the Atlantic seaboard. Cheaper vessels, smaller crews and lower wages paid them combine to this end. Shippers and vessel owners aver that it costs from 20 to 25 per cent. more to transport lumber to the Atlantic seaboard from American ports on the Pacific than from British Columbia ports—and America dug the canal. With rail rates the same as, and water rates, say, $3.00 per M. lower, British Columbia manufacturers have an opportunity to reach the coveted ten million people, and they will grasp it.

Among the lumbermen of the west there is an urgent demand for the restoration of an import duty on lumber, at least sufficient to prevent dumping in times of stress. Admittedly their business is demoralized. As in the case of British Columbia there is an excess of productive capacity which cannot adjust itself to demand because of small-unit production and the facility with which supplies of raw material may be obtained. On both sides of the line the industry is in a helpless condition. Every thousand feet of lumber unmarketable at home which can be sold on the opposite side of the line is sold at any price above the cost of the labor applied in producing it because such sales reduce the cost of the output and add to the profits of the producer by helping him meet his overhead. Under the conditions which have prevailed during the greater part of the past seven years lumber manufacturers have followed receding hope until many are seeking the only direction of motion their perspicacity reveals—the return of their investments in stumpage through the immediate agency of the saw. Lumbering is a primitive industry in which countless men having primitive ideas of business are able to engage. It is undergoing enforced readjustment because it has at last reached the period when it must yield to the demands of modern business. Neither protective tariffs nor any other legitimate forms of legislation can save it in the absence of large control of raw material, large scale production and applied modern business principles.

From the standpoint of national economy there would be danger in restoring a duty on lumber. The immediate effect would be to attract into a less profitable industry capital that would have been invested in more productive channels. As a result waste would be further increased with corresponding loss to communities and countries. Temporary depression has reduced the Canadian demand for British Columbia lumber and the United States will be made a dumping ground for the surplus of its mills at prices as close to the cost of production as may be necessary to sell their product, until such time as the surplus of productive capacity shall be forced out of business or more profitable markets can be found.

British Columbia mills cannot compete with American mills and earn a profit; but so long as a market can be found they will avail themselves of it and be large factors in continuing the present bootless condition. It is a raw, primitive country engaged in primitive industries. Its forests comprise its chief resources. It sends to us its lumber, shingles and pulp in return for our manufactured and agricultural products. If free trade be continued each country will tend to produce only those things for which it is best adapted and rely upon the other for the things desired and in the production of which it has a relative advantage. While the United States produces an enormous volume of raw materials it is destined to be a great manufacturing nation. Our markets for manufactured goods must be found in countries like Canada. During the fiscal year ending June 30, 1913, we sent to each individual in Canada about $52 worth of exports and took from each individual about $15 worth of imports.

Unless we give we cannot receive. The problem resolves itself into the economic question of whether or not those lumbermen of the United States who are impoverished by their own inability to apply fundamental principles of efficiency should be protected at the cost of other industries until an enforced readjustment is complete. The advantages of the contest are theirs.

## Brothers killed in a Mill

A boiler in the sawmill owned by Henry Fields and Sons, in Sinclair Township, near Huntsville, Ont., exploded on April 17th, and killed Mr. Fields' sons, George and William. The cause of the explosion has not been learned. George was unmarried and aged about forty years. William leaves a wife and family of small children. He came from Toronto two years ago. The family are well-known throughout Muskoka and have been residents there for nearly forty years.

## Some points about Cutter-Head balance

Suppose a 5-lb. knife is put on a cylinder having a 6-inch cutting circle and running at 4,000 r.p.m. If the knife is 4 inches wide, a ¾-inch strip along the cutting edge would weigh about 1 lb., which revolving at this speed would exert a force of 1,360 lbs. A similar strip in weight and size, next to this outside strip would only exert a force of 963 lbs. Half an ounce at the outer edge has a pull of 42½ lbs., and on the smaller circle only 30 lbs.

The force of small weights is so tremendous when running at high speeds that you cannot be too particular in balancing knives. An incorrect balance causes poor work by that particular head, and indirectly by all other heads, as its effect is transmitted to the injury of the entire machine, particularly to the bearings of the head out of balance.

Head bolts are a frequent cause of improper running balance also. Where there are a number of machines these bolts become easily mixed as they are much the same in appearance. However, if balanced they will vary in weight from ½ oz. to 1 oz. This causes trouble in balancing up a set of knives when it is necessary to put both knives and bolts in the scale. At the time of weighing an even break is secured, but later no allowance is made for the difference in bolt weights or in cutters which vary in weight according to their width and thickness. Thus a lighter bolt may be put on a lighter knife and a heavier bolt on the heavier knife, or the heavier bolts may be put on one end of the cylinder and the lighter bolts on the cylinder and the lighter bolts on the other. When putting on knives or bolts as they are picked up, without first pairing them off, a bad balance results. Then the operator looks elsewhere for the trouble, and among other things, cinches his bearings, causing them to run hard, burn, and do poor work.

In connection with the matter of balancing, the belts should also receive consideration. Belts give bad results when out of balance just as do cutter-heads. A common cause of this is the piecing out of belts with odds and ends that are too thick or thin, too wide or narrow. A short piecing that is too heavy is worse than if too light. It causes constant slipping, and the higher the speed of the belt and the smaller the pulleys the worse this trouble. This is because centrifugal force throws the belt away from the smaller pulley, lets the speed slack and forces the remainder of the belt to pick up this lost speed. This is easily proved as daylight can be plainly seen between the belt and the pulley every time the heavy piece passes over. Of course, this improper balance puts an unequal strain on the belt, causing it to give way before it otherwise would. So, to be on the safe side, balance your belts as well as your knives, heads and pulleys. Berlin Quality.

## Importance of Belts in Machine Expense

There is no machine having as many moving parts as any single belt, and so the matter of lubrication is entitled to very much more serious consideration than it usually receives.

There is friction between the fibers of a belt just as there is friction between the moving parts of a machine. It is, therefore, logical to assume that these fibers require just as much lubrication as the moving parts of any mechanism. A properly lubricated belt bends easily and therefore saves a lot of power ordinarily lost where stiff belts are operated over fast-running pulleys. Moreover, a belt lubricated with the proper dressing, lasts very much longer than the one that is stiff and dry. This is due to the fact that the fibers of the dry belt cut each other, thus cracking the belt. Furthermore, the dry belt has to be very tight in order to pull its load. This stretches the fibers against one another in a way that soon proves destructive.

A belt cannot pull its load when there are air pockets between it and the pulley, and the only way to exclude this air is to make the belt soft and pliable. If a new belt, after a few days' operation, is examined on the side next to the pulley, it will be discovered that not over half the surface of the belt has ever contacted with the face of the pulley. A belt in this condition would have put the pull of a belt half its size which was properly lubricated.

A sticky substance should never be placed on a belt. Use a dressing that goes into the belt, put it on both sides so that it will quickly penetrate the fibers all the way through.

Regarding the power required to run tight belts, it takes about 50 per cent. more power to operate a shop equipment of tight belts than it does when the belts are in good condition and running slack. The upkeep of machines, countershafts and lineshafts is another item that should not be overlooked. In shops where the belts receive but little attention the millwright is invariably rebabbitting boxes, and this is very expensive since it involves idle machinery.—Berlin Quality.

## Prairie Province Outlook Brightening

Mr. M. M. Harrell, a well-known Vancouver lumberman, who recently returned from a three week's trip through the prairie provinces, reports that business conditions in the small prairie towns are very promising. Ninety per cent. of the farmers, he believes, are free of debt, and with the prevailing good price for wheat they are expecting to make a large amount of money this year. He believes that there will be numerous cases of farmers retiring at the end of this year and moving out to live at the coast. He reports forty per cent. more acreage ready for seeding to wheat this year than last year. In regard to the lumber trade of the prairies Mr. Harrell said that conditions all pointed to increased business coming from the farmers. The prospects were so good that he had appointed thirty agents during his trip. Many bankers whom he had visited told Mr. Harrell that they could point to numerous farmers to whom they would lend one thousand dollars or two thousand dollars on their personal notes. During the past ten or twelve years, farmers had had little time or money for building good houses or barns. Excepting in the older districts the barns and shacks were of the rudest description. This meant that the farmers would need lumber this fall, and with the crop assured and prices still high, they would send in orders for lumber. This year, Mr. Harrell believes, there is sure to be a good crop. The acreage under crop will increase forty per cent. Farmers are using every possible effort to put all land into wheat. Weather conditions so far had left nothing.

"It needs only a visit to the general stores and the banks in the small towns on the prairie to get a touch of the optimism of the country," Mr. Harrell said. "On Saturday nights the farmers are there buying their supplies and to all appearances there is no indication of hard times. The bankers are ready with money to finance farmers this year and are helping them to buy seed grain for the coming crop. Only in the larger cities of Edmonton, Calgary, Regina and Saskatoon is business quiet in comparison with former times. The people of the prairies are counting on making their fortunes this year and then coming to the coast to make their homes. They look to British Columbia as the place to come to settle down and spend their money. In the meantime the lumber industry and every other line of business at the coast will share in the prosperity from the high price of wheat and the heavy crop this year. With the Panama canal opened, shippers of wheat from the prairies expect all grain west of Regina to go by way of Vancouver. This will be the case at any rate when the government elevator is built. Naturally when the wheat is marketed in Vancouver the farmer will spend his money there."

## B. C. Manufacturers Report Shortage of Cedar Logs

Some British Columbia lumbermen are now urging that the regulation recently put into effect by the Provincial Government, granting the right to loggers to export cedar logs, has been in operation long enough and that a shortage of cedar logs is developing in the province. They report that prices of cedar logs have advanced and logs have become so scarce that it is impossible for the cedar mills to get material enough to make their cut. They admit that the regulation was a good one for the time being, but claim that it should now be withdrawn as there is a good demand for shingles and all kinds of finishing lumber, especially cedar siding, and it is difficult to get raw material. Accordingly they are urging the Government to withdraw the permission for exporting cedar logs.

## B. C. Gets Important Australian Order

Orders have recently been received by the Forestry Branch of the Department of Lands of British Columbia from the Australian Government for a cargo of British Columbia lumber amounting to 550,000 feet, according to a recent Vancouver despatch. It is understood that this order is one of the first results of the activity of the British Columbia Government in conjuiction with the lumbermen, with a view of increasing the export trade in lumber. The material is to be used for public works in New South Wales and is being supplied by the Victoria Lumber Company from its mill at Chemainus. Although the order is for 550,000 feet, a larger shipment will be sent if a large enough vessel can be procured.

A Vancouver, B.C., despatch states that Industrial Commissioner W. L. Darling reports that he is in position to place an order for 4,000,000 feet, more or less, sawn fir ties, size 5 x 8 x 9 feet, for English railways, providing a suitable vessel can be found to carry it. The order can be reduced or increased in order to make up a full cargo. It will be placed subject to the usual inspection conditions, and the price offered is f.o.b. ship's bottom.

The desire for new sources of supply for pulpwood is leading to many experiments with new woods and wood in different forms, and it is beginning to look as if eventually we will develop the use of wood waste for pulp-making.

## Seizure of House is Not Formally Legal

Montreal, April 9th (Special to the Canada Lumberman):—Mr. Justice Mercier, sitting in Montreal, has decided a case of interest to Province of Quebec lumber firms supplying goods to contractors. This was the case of the South Shore Lumber Company vs H. H. Loiselle, defendant, and E. P. Gordon, mis-en-cause. The plaintiff supplied $600 worth of lumber to the defendant for a house for E. P. Gordon, and took out a seizure of the house, on the ground that payment had not been made. Gordon was not notified of the fact until the plaintiff was supplying the lumber to the defendant until the work had been in progress. His lordship decided that before a supplier of materials could invoke a privilege, he must give a notice to the proprietor outlining the nature of his contract with the contractor, the cost of the materials and for what building they were destined—and this before any materials at all were delivered on the job. The proof in the present case showed that this essential formality had not been complied with. What notice was given, was forwarded after the delivery of the materials had started, and without determining whether such notice was sufficient in law, it must be said that it was tardy. Such tardy notice could not have the effect of creating a privilege, even for materials delivered after the notice was given. Hence the action of the plaintiff was unfounded and it was dismissed with costs.

## Woodsman Not Under Compensation Act

Mr. Justice Pouliot, in a recent Quebec case which came before him gave a decision to the effect that a woodsman who injured himself by cutting his foot with an axe during the felling of a tree had recourse for redress under the common law and not under the Workmen's Compensation Act. The reason for coming to this conclusion was that the work done by a woodsman was to be considered as an agricultural pursuit, not a manufacturing pursuit. It was to be concluded that the intention of the legislature in drawing up the Workmen's Compensation Act was to protect the workmen against the mishaps of industrial pursuits, and in no wise against the dangers inherent to the cultivation of the soil, and forestry operations, against which personal initiative renders it incumbent upon them to protect themselves. This decision was given in the case of Michaud vs. Gagnon.

## Valuation of Lumber Company's Property

An interesting judgment was recently given by Mr. Justice Hutchinson in the Supreme Court at Sherbrooke, P.Q., in an action by the Brompton Pulp & Lumber Company against the Corporation of Lingwick. The action arose over the valuation of the company's property in the township of Lingwick, where they owned about three-fifths of the immovable property, the balance being owned by farmers and residents. The company claimed that all the property in the township should be taxed upon a uniform basis. In 1908 the company's property was valued for taxation at 54 per cent. of the total value of property in the township. In 1911 this was increased to 59 per cent., and in 1914 to 64 per cent. Mr. Justice Hutchinson held that the taxation should be on a uniform basis and reduced the latest valuation by 25 per cent., making it $254,688 instead of $339,583.

## Rouge Boom Company's 1915 Tolls

The Rouge Boom Company, Montreal, have received authority from the Privy Council for levying the following tolls for the use of their works during the season of 1915:—

| | | | |
|---|---|---|---|
| 1. On each saw-log 17 feet and under in length | 1 ct. | 1/5 ct. | 1 1/5 cts. |
| 2. On each piece of round or flattened timber over 17 feet in length | 5 cts. | 1 ct. | 6 cts. |
| 3. On each piece of square or waney timber | 10 cts. | 2 cts. | 12 cts. |
| 4. On each piece of 4-foot wood | 1/24 ct. | 5/24 ct. | ¼ ct. |
| 5. On each railway tie 8 feet long | 7/30 ct. | 1/6 ct. | 2/5 ct. |

The above charges cover the cost of gapping and putting timber and logs in owner's sacks.

At a recent meeting of the Washington branch of the West Coast Lumber Manufacturers' Association Mr. E. J. Palmer, of the Victoria Lumber and Manufacturing Company, Chemainus, B.C., referred to an inquiry from Europe for lumber that has been received on the Coast. Mr. Palmer also called attention to the fact that there will probably be an easing up in the tonnage stringency in the near future and that plenty of vessels will be available to transport lumber from the West Coast to Europe in the event that an order is placed. He said that there are some twenty or more vessels in Australia which were seized when the war broke out, some fourteen of which have been sold by the prize court and are about to become available for business. The inquiry to which Mr. Palmer referred is for one and two-inch material.

## Utilization of Waste in Handle Making

No substitute has yet endangered the position of wood as the most suitable all-round handle material known to man. Some handles are made wholly or in part of other things, but the number is small in comparison with those in which wood plays the principal part. This field offers few inducements to substitutes.

Wood's qualities which fit it for the pre-eminent position which it holds in the handle industry are many. If a springy, resilient handle is wanted, such as are fitted in axes and some hammers, wood has the properties to a greater degree than any other available material. If a short, stiff handle is demanded, there is no equal of wood, when strength and weight are considered. If protection against heat is desired, or electrical insulation, it is still the best that can be had.

It is therefore, natural that the handle maker, no matter what is the particular line in which he is interested, should look upon wood as his most valuable resource. He should be no less interested in protecting that resource. Some handle makers do so, while others are not looking as carefully after waste and better utilization as they should. A great deal has been said and written about the waste of hickory by handle manufacturers, particularly the waste which occurs in the forest before the rough material reaches the factory; but much waste has occurred along other lines.

### The Turning Tide

There is unquestionable evidence that the tide is turning. Better methods are coming into use. The spirit of conservation is abroad in the land, and the men who make handles are awake to the situation. It is understood that the scrap heap is a mighty poor payer of dividends, and the tendency of business now is in the direction of having no scrap heap, or, at any rate, to make it as small as possible.

That result may be brought about on the one hand by each manufacturer working up his own material as closely as possible; and on the other hand by turning over what he cannot use to somebody who can use it. This is being done in numerous instances and with results which are encouraging.

The public once insisted that axe, hammer and hatchet handles, when made of hickory, should be of ivory whiteness. That is, none but the sapwood was allowed. That necessitated throwing the red heartwood away, and that was frequently half the tree.

That is not done now. It was discovered that the red wood of the heart was as good as the other for many kinds of handles, particularly for short kinds, such as those for hatchets, knives, augers, and numerous other small tools. Even for long handles of large size it is good enough.

It is difficult to estimate how much good hickory has been saved from the scrap heap by the discovery that red color did not disqualify the wood for use. In fact, when it is employed in making some kinds of small handles it is preferred to the white sapwood by many.

### The Range of Handle Woods

Hickory is only one of many handle woods, and, except where great toughness and resiliency are demanded, it is not the most important. Vast quantities of both softwoods and hardwoods are annually converted into handles in the United States. Take the State of New York as a typical example. Hickory is there the sixth wood in quantity used, and it is scarcely one-fifteenth as prominent as beech, which is chiefly made into pail, package, broom, mop, knife, and other small handles which are demanded by the million. Sugar maple is valuable for the same class of handles as beech, and is bought in large amounts. The following table shows the woods bought annually by handle makers in New York, with the quantity of each:

| Wood | Feet |
|---|---|
| Beech | 3,076,000 |
| Sugar maple | 1,418,000 |
| Birch | 861,000 |
| Ash | 466,400 |
| White oak | 336,500 |
| Hickory | 204,150 |
| Basswood | 37,000 |
| Elm | 30,000 |
| Applewood | 22,000 |
| Silver maple | 10,000 |
| White pine | 10,000 |
| Lignum vitae | 1,500 |
| Granadillo | 685 |
| Ebony | 654 |
| Rosewood | 610 |
| Cocobola | 480 |
| Total | 6,474,979 |

The foregoing table represents fairly well the proportions of various woods used by handle makers in northern states. The principal handles made of some of the woods follow:

Broom handles, beech, maple, birch and ash.
Shovel handles, sugar maple and white ash.
Axe handles, hickory.
Brush handles, sugar maple.
Handsaw handles, beech and applewood.
Hoe and fork handles, white ash.
Hammer handles, hickory.
Coal sieve handles, basswood, beech, maple, ash.
Small tool and package handles, miscellaneous woods.

### Waste from Veneer Plants

The makers of handles are in a position to use some of the waste of veneer plants, chiefly the cores of logs from which the veneer has been cut by the rotary process. Smaller handles for pails, tubs, packages, and for such articles as dippers, ladles and knives, want no better material than some of the cores. One of the highest uses of core waste yet reported is shown in the manufacture of gunstock and pistol grips. The woods must, of course, be suitable for these articles.

## Advertising for the Retail Yard

Enterprising retail lumbermen are supplementing their newspaper advertisements by sending out pamphlets, circulars and follow-up letters to a selected list of regular and prospective customers. Such a campaign is not very expensive and is a very effective way to overcome pernicious mail-order house competition. Some dealers have considerable trouble in preparing this literature, and have asked us for suggestions and advice. The object of any form of advertisement is to stimulate or create a demand for the material sold by the advertiser. It is also essential to convince the prospective customer that he can get his wants supplied from the advertiser equally as well, if not more satisfactorily, than from any other source.

An enterprising superintendent of a line of yards in Saskatchewan asked us to prepare two letters to be sent to the farmers of his territory. One of these communications was for the purpose of stimulating a demand for new homes and the other to create a desire or to impress upon the farmer the necessity of larger and more commodious barns. In compliance with this request we submitted two letters which were of a general character, leaving it to the local manager to incorporate some new ideas and make them of local application.

For the benefit of any retail lumberman who may be contemplating getting out similar circular letters to stimulate business, we publish herewith these communications. We would not, however, recommend that they be used verbatum. Some of the ideas given, however, can be incorporated. The communications referred to are as follows:

### The Barn Letter

Dear Sir:

How about that new barn you have been promising yourself for some time past would be yours? Don't you think it is about time you built it?

Do you know that, in the minds of people in general a farmer is judged largely by the buildings and improvements upon his land? Do you realize that the possession of first-class buildings, well kept, would cause the banker, merchants and other business men to consider you more entitled to credit?

I wonder if you realize that the one thing which is doing more than any other to check the prosperity of the average farming community in western Canada is the failure of the average farmer to raise more cattle and hogs. Have you ever noticed that the most successful farmers in our little community are, as a rule, the ones who raise more cattle and hogs than do their neighbors; that these farmers have a steady income the year round; always have a few dollars in their pockets, and are, as a consequence, able to take advantage of the cash prices of the merchants; that they get away from paying heavy interest rates to the banker, the merchants and the implement men; that they are not worried nearly frantic during the fall of the year by collectors; that they always have a few dollars in the bank with which to take a little pleasure trip now and then?

Would it not afford you considerable pleasure to be counted among this number? It can be accomplished in your case by a few less acres of grain, perhaps, and a few more head of cattle. But in order to carry out this idea successfully you must have ample barn room in order that they may be cared for properly. So why not plan that new barn now? Have it figured out so that you can go ahead and build it immediately you have finished your spring seeding. And when planning it, do not neglect to make it large enough so that you may house that binder, reaper, mowing machine, those plows and harrows, which you may perhaps have been accustomed to leaving more or less exposed to the weather in the past. Do you know that it has been proven absolutely that a binder, properly cared for and placed under cover when not in use, can be made to do good work for fifteen years? How many years of useful service did you have from your last one? Save those heavy implement bills which you never seem able to get away from. Make it impossible for the implement collectors to worry you, by making your barn large enough so that you can put your machinery under cover and consequently so preserve it that it will no longer be necessary to replace it each few

years. Three years of this kind of care given to the machinery used upon a quarter-section of land will save you the price of an implement shed. This is not exaggeration; it is a proved fact.

Come in and let me aid you in planning this barn. Join your neighbor in making our community a more prosperous one; our town a larger and better one; in making it possible for our merchants to do more of a cash business and consequently sell us their goods cheaper; do this by raising more cattle and hogs. And in so doing you will be helping to boost the price of farm land in our community and consequently be adding to your own individual wealth.

Yours truly,
YARD MANAGER.

**The House Letter**

Dear Sir:

Has it occurred to you that now is the time to plan your building improvements for the coming year? Perhaps you have had a vague idea for some time past that you owed it to your wife and to yourself and family to build an addition to the house you already have; or perhaps to build an entirely new house to take the place of the one which, during the hard, lean years when you were getting your start, had to be made to answer as a shelter for yourself and the woman who chose to face with you the hardships and disappointments of a homestead life on the prairies of western Canada. If so, let that idea take definite form at this time. Talk the matter over with her during these long winter evenings. Remember, she is much interested; that the possession of a comfortable and well-kept home is perhaps the thing which, above all others, outside of your regard for her, she most desires in this life. Remember that your work keeps you out of doors and away from the house a greater part of the day during most of the year, but that your wife is forced to spend her time about the house, ministering to your comfort. The chief aim of her life has always been to make you comfortable, and by so doing to help create for you both that happiness which is the due of every married couple. She is doing her best. Are you quite sure that you are making it possible for her to accomplish what she has set out to do; are you quite sure that you are making it possible for her to be contented and happy, and by so being, to keep her health? Are you sure that your children are being surrounded by the comforts and conveniences of a good home, so that they may grow into men and women who will be a credit not only to yourself but to the community at large?

Perhaps you have done all these things to the very best of your ability. If so, you are to be congratulated upon the possession of exceedingly good judgment, and your wife upon the possession of such a husband. But if, on account of being so much occupied with your farm work or perhaps on account of lack of funds, you have not done so, then think the matter over; talk it over with her and then come in and talk it over with me. This is the slack time of year in the lumber business, and it would give me much pleasure to show you plans for a house which should meet your requirements, or to draw new plans for such an one as you think will suit; also give you figures on the cost of it. Let us all get together, your wife, yourself and me, and see what can be done to figure out a house which shall be within your means and at the same time, one the possession of which will mark you as one of the successful and prosperous farmers of your community.

Yours truly,
YARD MANAGER.

The policy being adopted by the Canadian Company is very concisely explained in a letter we received from the superintendent, expressing his appreciation of the service we have rendered him. We take the liberty of quoting the following extract from this communication:

"The officials of our company for the last year at least have been laboring hard to make our company the very best, most progressive up-to-date company in the Canadian Northwest. To that end a general efficiency campaign has been inaugurated throughout the system, with the object of educating the managers to be live business men instead of mere agents—cogs in a wheel. Those who could not or would not progress have been replaced by men of greater promise, preferably by young men with brains, regardless of their experience. I must say that progress made this far has been very promising.

"We are gradually broadening our efficiency work of which the desire for these letters is a part. The object of these letters is twofold. First: Business this year promises to be very dull, at least until a good crop is assured, so we wish to stimulate our business as much as possible. Second: We recognize the effort to stimulate business to be an element of efficiency, whether business conditions be good or bad."—Mississippi Valley Lumberman.

---

The death is reported of T. L. Gillies, lumber dealer, Port Dover, Ont.

---

Jonathan R. Little, a pioneer lumberman of New Brunswick, died recently at Kouckibougnae, N.B., in his 95th year.

## Retail Credits and Terms of Sales

An interesting address was recently delivered by Mr. C. C. Trapp on the subject of Credits before the South Western Lumbermen's Association Annual Meeting, which was held at Kansas City on January 28.

"I come to you with a message which contains nothing new, but which presents a combination of ideas gleaned from the many articles published in the various trade journals, together with the ten and one-half years' experience as a retail dealer. I am asked to talk to you upon the most neglected, and the most needed subject of interest to lumbermen, that of Credit.

Probably, and no doubt truly so, the too liberal extension of credit has done more to wreck the retail merchant than all other causes. The present system of extending credit is without merit, and every retail merchant in the country should adopt and use some plan which will put his business on a safe basis. This can be done, and we retail lumber dealers should be the first to set the pace.

It has been astounding to me to discover the fact that 90 per cent. of the retail lumber dealers have been selling on the wideopen plan, and have encouraged the system of which we are all victims. Our patrons haul out whatever they may want from our yards and pay us when it best suits their convenience, which nine times out of ten results in a very great inconvenience to the dealer, for he is obliged to enter into a collection campaign or borrow money to meet his bills. This is bad business, for it not only endangers his own credit but forces him to ask extensions of time, which often prove embarrassing.

The blame for the present unsatisfactory credit system is traceable to the unbusinesslike practice of the dealers themselves. We have not only permitted it to be forced upon us but we have unwittingly invited it. We have made no distinction between cash or credit, nor between short time and long time. We charge just the same for a bill of lumber, when we are paid cash, as we do if the account is to be paid a year hence. We make the same price on a bill paid at the end of ninety days as we do on one paid at the end of two years. In fact, if we offer no inducement for cash, for payment within a short time after purchase, how can we expect our patrons to do otherwise than take advantage of the unlimited time which we give them?

It was because of our own indiscretion along the lines already enumerated that we were obliged to take steps to remedy the effect on our business, and to give you a taste of our experience I must go back to the year 1912. On June 1 of that year, upon completing our annual inventory, we found that our bills receivable very greatly exceeded our stock and working capital. In fact, our working capital was entirely absorbed, and the necessity of borrowing confronted us. However, we took no steps to remedy the situation, but proceeded along the same line until June 1, 1913, when we again invoiced. This time we were forced to realize that our bills receivable had so grown that the excess over and above our stock and working capital was double that of the previous year. We were certainly getting into deep water. Following upon this disclosure your humble servant began an investigation as to the cause thereof, and what was necessary to put the business on a safe basis. It was not until late in the fall of that year that we were able to arrive at any definite conclusion as to what was needed and what would be effective in bringing about the much needed change.

### Results of Inviting Extended Accounts

We awoke to the realization that we had been doing business with the public for nine and one-half years without offering a single inducement for cash; that our credit system had been wide open and that we had not only encouraged long time but had brought the burden upon ourselves. We had been careful not to extend to parties "not good," and believed that we could close out our business and collect every dollar owing us, with not to exceed fifty dollars per year loss. Yet we had no working capital and either had to borrow or buy our stock as the money came in.

Having suffered the thrills of this experience, and knowing that a solution of the problem must be had, we worked for six long months before arriving at a definite decision. We thought of several plans which would aid materially but none of which met the two conditions necessary for the establishment of a sane policy, and, after consulting with many of our customers and asking their advice upon the subject, we were able to learn that the most practical plan must be liberal to the customer and protective to the dealer.

### Intelligence in Generosity

We were led to this belief because of our knowledge of the fact that there are in every community two classes of customers—one which is at all times able to pay cash, and the other which is deserving and needful of credit. Both classes have been taken care of by the dealer, and each in accordance with his value as a part of the consuming public. We believe it a part of our service to accommodate our patrons, and know that there is a time when every customer needs some accommodation. For this reason we do not think it possible to get down to a strictly cash basis, neither do we court same,

for we would then be robbed of the pleasure of granting a favor to a deserving friend.

We believe that every retailer should give to his customer more than he receives, but should not give to the extent that it cripples his business. We find the consuming public as broad-minded upon this subject as any retailer dare be; also the sentiment of the public is favorable to any plan which will better business conditions.

### Suggesting Specific Terms of Sale

I feel free to say that there are hundreds of dealers in attendance upon this convention whose business is in a condition similar to that which overshadowed us in June, 1913, and it is for the purpose of aiding all such dealers that I am about to give you a solution of your problems, and that solution lies in the adopting of some specific terms of sale. This we did, and since the first of the year 1914 have used a plan which has proved entirely satisfactory to our patrons and ourselves.

In the final December issue of our home paper we announced our purpose to change our policy the first of the New Year. In the first January issue we announced the plan, and at the same time hung in a conspicuous place in our office a placard 11 x 12 inches upon which was stated, in large letters, the terms upons which we have since been doing business. This placard was framed and reads as follows:

**Our Terms**

Building material ... ... ... ... ... ... ... ... 90 days
Coal ... ... ... ... ... ... ... ... ... ... ... 30 days
8 per cent. interest charged on all accounts not paid when due.
2 per cent. discount for cash on all building material.

### No Discount on Coal

When adopting these terms it was our intention to be liberal to the consumer. We feel that we have been so, for on all purchases of building material we are given but 60 days' free time. We have given 90 days. On our coal purchases we are given only until the 10th of the month following shipment. We have given 30 days' time on all of our purchases, which is more than we receive. We are allowed a discount of 2 per cent. after deducting the freight, which, in fact, will not average more than 1 per cent. on all purchases of building material. We grant a discount of 2 per cent. on the net sale, which can not help but be liberal, since the discount we give is double that which we receive.

We are charged interest on all of our over-due accounts, and on all accounts which are not paid at the time when due we charge 8 per cent. interest.

### A Satisfactory Change

Thus have we revolutionized our business. We would not return to the old way of doing business even at a loss of one-third the volume of sales for the last year. In fact, our motto now is, "Less business on satisfactory terms, rather than more business at a sacrifice."

Business cannot be changed from long time to short time basis overnight. It is a matter of education, and whatever terms of sale are adopted by any merchant some advantage must be shown the consumer before he will approve of it. Gradually will he see the wisdom of taking the cash discount and gradually will the dealer see his working capital grow in proportion.

Business is asked to bear all the burdens of misfortune, and this, coupled with the long time credit of to-day, is mainly responsible for high prices. When the consuming public is educated to know this, and when the retail merchant adopts and strictly adheres to some specific terms of sale, and at the same time throws aside his greed for business, a complete revolution will take place in the retail business of to-day, and fewer failures will occur among business, brought about by their too liberal extensions of credit.

## Quebec's Forest Wealth

Officials of the Provincial Government have estimated the total worth of the forests of Quebec Province to be $600,000,000, made up as follows: One hundred billion feet, board measure, of pulpwood, $100,000,000; 50 billion feet, board measure, white and red pine, $200,000,000; 125 billion feet, board measure, spruce and balsam fir, $250,000,000; 35 billion feet, board measure, of hardwood, birch, maple, etc., $25,000,000; 20 billion feet, board measure, of cedar, $25,000,000.

Sir Geo. E. Foster, Minister of Trade and Commerce, in a recent announcement in the House of Commons, stated that the Dominions' Royal Commission, whose tour through Canada last fall was suddenly put an end to by the war, may resume its sessions this summer, starting in British Columbia. The commission was appointed at the suggestion of the last Imperial Conference, and has held sittings in England, Australia, New Zealand, South Africa and Newfoundland.

Mr. J. William Jones, a member of a large Liverpool timber firm, recently visited Vancouver. He spent several weeks at the coast enquiring into trade conditions and placed a large order with a Victoria concern.

## Barbados Market Report

S. P. Musson, Son & Company, Barbados, report under date of April 1st, as follows:—Lumberstuffs.—White pine—The Schr. "Catherine" has arrived from Bear River, N.S., via Grenada, with a small lot of about 30 m. ft. which had previously been sold to arrive at $34 duty paid, for merchantable, and we value further receipts at this price. Spruce—The "Catherine" also brought some 70 m. ft. sold at $26 duty paid. The market is fully stocked, and there is no demand at the moment. Shingles—The position is unchanged. Stocks are ample for present requirements, and there is but little enquiry. Shooks—The S. S. "Freda" from Mobile has brought 2,236 bundles for dealers' account, and 1,752 bdls. staves, likewise for dealers' account. Wood hoops—We note the arrival of 540 bdls. by steamer from Newport, Monmouth.

## Miscellaneous News of Interest to Lumbermen

Lumbermen have very little idea, as a rule, of the devious and astounding methods by which the cement manufacturers, for example, are building up their trade, remarks that well-known authority, the American Lumberman. No ordinary competition, no ordinary advertising, will serve to offset their work, and lumbermen should bear in mind that what is needed is not merely a defensive campaign which will resist the inroads of cement, brick, tile, etc., but a really offensive market extension, fighting-for-business campaign of the sort that will open up new fields and that will place the lumber industry in a position where it can market its products at reasonable prices and with reasonable profit regardless of external or internal competition.

A recent despatch from Duluth, Minn., stated that many millions of feet of lumber were awaiting the spring drives on the streams emptying into the Mississippi. During the second week in April the ice on most of the lakes and streams was almost ready to move. One of the largest drives of the season will be brought down the Cloquet River, probably 40,000,000 feet, and 14,000,000 feet of white pine and Norway pine will go down the Swan River. Other logging companies have cleared their camps of the winter's cut, which is being shipped by rail to mills at Superior and Duluth. The announcement by the railway companies of plans for construction work has given an impetus to the lumber trade in that district and the prospects for the coming season are greatly improved.

The Kolambugan Lumber Company, of which Findlay, Richardson & Company are proprietors, has been awarded the $50,000 contract to furnish the Army in the Philippines with 2,430,495 board feet of lumber, to come from the white lauan and almond forests of Mindanao. The award is regarded with great satisfaction by the lumbermen of the Philippines, as it is the first time Philippine woods have ousted Oregon pine in a large army contract.

Reports which have just been received from Stockholm, Sweden, state that Germany has agreed to consider all sawn and planed wood goods as non-contraband. For some months these goods have been declared contraband and the result has been a very heavy handicap on shipments from Sweden. The change will probably result in a considerable readjustment of f.o.b. values, to the benefit of Sweden and to the detriment of the White Sea shippers.

During the month of March 45,895,000 feet of logs were scaled for royalty in the coast district of British Columbia, including 2,270,000 feet that were exported to Washington. The reports received by the Department of Lands give evidence of a revival in the lumbering industry. The logs exported were chiefly shingle cedar.

A Vancouver, B.C., report states that there has been quite a call for shingles from Ontario during the past few weeks; more so than usual, in fact, although the shipment to points in that province have not been particularly large. Prices remain about the same, which are low to medium.

Several hundred thousand copies of a booklet, teaching the effect of fire in the Pacific Northwest and the necessity for caution, are being placed in the hands of school children in the Northwestern States by the Western Forestry & Conservation Association.

The Virginia and Rainy Lake Lumber Company, Virginia, Minn., have purchased from Russell Bros., Fort Frances, Ont., one of their Shaw motor head works, to be used by them for towing logs.

Birch veneer is being sought in Canada by London manufacturers of tea chests.

# WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## Wanted-Lumber

### Wanted to Buy

Inch Cedar suitable for boats. Box 184, Canada Lumberman, Toronto. 9-12

### Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

### Wanted to Buy

Birch, Oak, Maple, Ash and Elm. Apply by letter, stating prices, thicknesses, lengths, average widths, quality, also name point of shipment, to Robert Cox & Company, Hope Building, Ottawa, Ont. 7-10

### Wanted - Rock Elm

250,000 to 350,000 feet of 10/4 No. 1 common and better, standard lengths, 6 ins. and wider. Will take the stock green or dry. Address American Lumber & Manufacturing Company, Pittsburg, Pa.

### Wanted to Buy

A hardwood timber limit with large percentage of Birch, must be located convenient to railway so that mill can operate during winter months. State estimated quantity, best price and terms. Box 187, Canada Lumberman, Toronto. 9

### Birch Wanted

I am open to purchase one million feet of 1-in. Birch log run, mill culls out, on a railway rate not to exceed 9c. to Montreal. State how much you have to offer, when sawn and price wanted.

HORACE HARTLEY,
19 Mayor Street,
8-9 Montreal, Que.

## For Sale-Lumber

### For Sale

For shipment May 1st car lots Cheese box, Veneer. G. R. Jones, Eldorado, Ont. 6-9

### We Have a Full Stock

of Hardwood, Hemlock and White and Norway Pine Lumber, Norway and White Pine Piling, up to 60 ft. Keenan Bros., Limited, Owen Sound, Ont. 3t.f.

### For Sale

Two cars of 3-in. Birch, first and seconds, and 2 cars of 2½-in. Birch, first and seconds. This stock is well manufactured and seasoned. Cut early in 1914. Drayton Mills, Limited, Drayton, Ontario. 9

### Shingle For Sale

One million Northern Ontario Cedar Shingle for sale. One X, Two X, and Three X, or make us an offer for the whole cut, f.o.b. car Field. Freight rate to Toronto 11 cents. The Field Lumber Company, Limited, Field, Ont. 9

### For Sale

PILING, any length in Spruce, Red, White and Jack Pine or Hardwood.
Telegraph Poles, Ties and Fence Posts. Square Cedar and Hemlock up to 12 in. x 12. Correspondence solicited.

ANGUS PRENTICE & SON,
189 Arthur Street,
9-14 Toronto, Ontario.

### For Sale—Dry Stock

Half million feet Hard Maple 1¼-in., 2-in., and 3-in.
10 cars 1-in. Basswood.
10 cars 1-in. Black Ash.
10 cars 1-in. Soft Elm.
Half million feet 1-in. and 2-in. Hemlock, 8 to 18 ft. long. Above stock is well milled and end trimmed. Rail or water shipment. Write us.

HALL BROS.,
9 174 Mutual Street, Toronto.

### FOR SALE
### Norway Pine—Mill Run

| | |
|---|---|
| 1 x 4/5 x 10/16 ft. | 1,000,000 ft. |
| 1 x 6 | 500,000 ft. |
| 1 x 8 | 85,000 ft. |
| 1 x 10 | 14,000 ft. |
| 2 x 4 | 165,000 ft. |
| 2 x 6 | 220,000 ft. |
| 2 x 8 | 320,000 ft. |
| 2 x 10 | 218,000 ft. |
| 2 x 12 | 65,000 ft. |
| Norway Pine Culls | |
| 1 x 4 and up x 10/16 ft. | 1,500,000 ft. |

DEVON LUMBER CO.,
5t.f. Ottawa, Ont.

### Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
c Montreal, Que.

### DRY BIRCH FOR SALE
### Shipment Immediately

The following Birch has been on sticks for over two years, and is perfectly dry. Log run, mill culls out.

2 cars 4 x 5 x 10 ft. and up.
1 car 4 x 6 x 10 ft. and up.
3 cars 5 x 9 and up x 8 ft. and up.

Apply HORACE HARTLEY,
19 Mayor Street,
8-9 Montreal, Que.

## For Sale-Machinery

### Woodworking Machinery For Sale

1 No. 51 Crescent universal woodworker; 2 24-in. planers and matchers; 3 12-in. buzz planers; 1 12-in. four-side moulder; 1 No. 802 Canada Machinery Corporation shaper; 5 30-in. Ideal pedestal bandsaws; 2 No. 619 Canada Machinery Corporation saw tables; 1 36-in. double drum sander; 1 20-in. American wood scraper.

H. W. PETRIE, LTD., Toronto.

### Rebuilt Veneer Machines

We have the following rebuilt veneer machines ready for immediate shipment.
1 Coe Lathe, 50-in. swing, 88-in. knife, 6-in. spindles.
1 Coe Lathe, 50-in. swing, 64-in. knife, 5-in. spindles.
1 Coe Lathe, 50-in. swing, 76-in. knife, 6-in. spindles.
1 Coe Lathe, 42-in. swing, 60-in. knife, 3⅜-in. spindles.
1 Coe 100-in. Power Clipper.
1 Coe 54-in. Power Clipper.
1 Coe Type A. Stamper.
These machines are decided bargains and carry the same guarantee as we give our new ones. Prices on application.

THE COE MFG. COMPANY,
Painesville, Ohio.

### Machinery For Sale

One Double Surface Planer.
Power-Feed Rip Saw.
12-in. Moulder.
Heavy Flooring Machine.
Vertical Boring Machine.

A. J. LINDSAY,
9 92 Pembroke Street, Toronto.

### For Sale
### Woodworking Machinery

One McGregor Gourlay Q.Y. 15 x 16 Planer and Matcher, with one set 4 bit 1-in. Matcher heads, one set Shimer 4 bit Expansion Matcher heads. Machine in A1 condition. For sale cheap for cash. Box 188, Canada Lumberman, Toronto. 9

## Wanted-Employment

**Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents**

Lumber Inspector with experience in looking after stocks, open for engagement. Box 190, Canada Lumberman, Toronto. 9

WANTED—Position by experienced Band Sawyer. Sober. First-class reference. Address Frank Weston, P. O. Box 59, Odanah, Ashland County, Wis. 9-12

Bookkeeper or Office Manager, experienced in lumber, wants position. Open for engagement June 1st. Good references. Box 1, Les Escoumains, P.Q. 9

Band and saw filer wants position. Strictly reliable, steady and up-to-date. Thoroughly dependable. Best references. Box 181, Canada Lumberman, Toronto. 8-11

Band Saw Filer wants Position. A1 reference; fifteen years' experience. State what you have in first letter. Address A. W. Woodward, 57 Kirkwood Street, Akron, Ohio. 9-12

Thoroughly experienced Lumberman requires position with Wholesaler or Manufacturer as Traveller or Shipper. Expert on White Pine Grades, both green or dry. Could look after cut of logs. Estimating and piling of lumber. Best credentials. Box 194, Canada Lumberman, Toronto. 9

Expert Band Saw Filer wants position. Fourteen years' experience on single and double cut saws. No proposition too large. Guarantee satisfaction in hard or soft woods. Strictly sober. A No. 1 reference. Address Saw Filer, P. O. Box 592, Memphis, Tenn., U.S.A. 6-10

A Forest Engineer—in government employ, who has received his technical training in Canadian and American Universities, and has done technical work in the main forest regions of Canada—east and west, with several years of practical experience—bush and lumber yards, previous to studying forestry, desires to hear from large firm or lumber association. Knowledge of French and English. Best credentials. Box 173, Canada Lumberman, Toronto. 8-9

## Wanted-Employees

**Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents**

WANTED a good resaw man, a good marker, and a good edger man; also good setter for steam set works. Experience in steam setting not necessary if capable setter and willing to learn. John S. Eagles & Company, 39 Canterbury Street, St. John, N.B. 9

WANTED an Accountant who has had experience in the lumber business for a lumber manufacturing concern. State age and experience, and give references. Box 192, Canade Lumberman, Toronto. 9

WANTED first-class experienced man as Traveller for Ontario. State age, experience, and references. Box 189, Canada Lumberman, Toronto. 9-11

## Business Chances

WANTED practical man with some capital to take over an established wood-working business now manufacturing wood mantels with other special lines. Located in best town on Georgian Bay. Rare opportunity for live man. Box 186, Canada Lumberman, Toronto. 9-10

Factory building approximately 9,000 feet floor space, separate office building, two railway lines, water power, and auxiliary steam plant. 30 miles from Toronto. Free for one year. Apply Wrights, Limited, 22 College Street, Toronto. 9

### For Sale

Hardwood timber limit with first-class sawmill. Maple, Birch, Beech, Oak estimated 20,000,000. Shipping facilities good. For particulars write Box 185, Canada Lumberman, Toronto. 9

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

### Sales Agents Wanted

Large U. S. firm making steel and wire prodncts wants sales agents in both Eastern and Western Canada. Lines include metal wheels and axles, farm wagons, tractor trucks, log and freight wagons, portable mountings for machinery, etc. Box 198, Canada Lumberman, Toronto. 9-10

### Lumber Business

For sale in Eastern Canada, a first-class lumber business in good running order, comprising over 200,000 acres license lands, sawmill with excellent loading facilities by deep water wharf. Principals or their solicitors only. Address Veray, Canada Lumberman, Toronto. 9-10

## WANTED

Salesmen selling supplies to Lumbermen and Contractors to handle as a side line Dr. J. M. Stewart's Veterinary Remedies, now being used by the greater number of Lumber Companies in Canada. Liberal commission.

PALMER MEDICAL CO., LTD.,
7-t.f. Windsor, Ont.

### FOR SALE

The Lumber Yard of the Estate of D. Dupuis, situated on St. James Street, Hull.
The property comprises a valuable block of land, having frontages of 254 feet on St. James Street, 221 feet on Leduc Street, 142 feet on Wellington Street, and 210 feet deep between St. James and Leduc Streets.
The yards are stocked with a large quantity of valuable lumber of all kinds.
The business is a good going concern, having a large trade, and was established in 1890. It can be purchased en bloc, or the lumber and rolling stock can be bought separately and the land rented.
The property is a valuable building site, suitable for subdivision into city lots, and is situated right in the heart of the business section of the city.
For particulars apply to P. H. Charron, 142 Champlain Ave., Hull. 7-10

## Miscellaneous

### Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

**For Sale**

Copies of "The Preservation of Structural Timber," by Howard F. Weiss. Published in 1915 by McGraw-Hill Book Company. 312 pages, illustrated. Price $3.00. Canada Lumberman, 347 Adelaide Street West, Toronto.

**Saw Mill Machinery For Sale**

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

## How to Run Belts

Always run the smooth side of the belt in contact with the pulleys.

This subject has been discussed considerably among belt men, and arguments are usually unconvincing, because there is no actual proof brought to bear on the subject. It is my aim here to show just why the smooth side is the correct one to use where a considerable load is to be pulled. Where the load is light, it makes little difference which side is used.

In the first place, all manufacturers agree that the smooth side is the best, and many of them stamp on their belts, "Run this side in contact with the pulleys." That should be a pretty strong argument, yet many belt men think they know better and deliberately use the rough flesh side anyway. They say the rough side should produce more friction.

However, actual tests have proved beyond a shadow of doubt that belts wear out more quickly where the rough side is made to do the heavy pulling. In one test two belts exactly alike were run side by side on pulleys of the same size on similar machines, and each belt doing the same amount of work. One was run smooth side against the pulleys and the other the flesh side. The result was that the flesh side belt had to be replaced in three months, whereas the other was as good for all practical purposes as when new. It has not been replaced yet, after a couple of years.

In another test four belts were used. Two were operated flesh side against, and two were operated smooth side against pulleys. The results were the same as in the first mentioned test. The flesh side belts had to be replaced.

If anybody is in doubt as to the correctness of these results I would suggest that he try similar tests himself.

If you have only one belt and cannot make the test very well, run the belt one way for a while and suddenly stop the drive. Feel the pulleys with your hand. You will find that with flesh side in contact the pulleys become hotter, which is a certain indication of greater loss of power. It is this heat, usually, that destroys the belt; for most animal and vegetable substances cannot well withstand high temperatures. Leather especially is destroyed by heat very quickly.

This heat is caused by slip, of course, and slip is a bad thing. Slip should not be allowed and can invariably be prevented by proper treatment with belt dressing preparations. However, even with belt treatment the smooth side is best, as may be proved to your own satisfaction by feeling the pulleys as already mentioned.

Belt traction does not depend upon belt roughness so much as upon belt contact. The idea is to make every square millionth of an inch of belt come in contact. The more contact, the better. Hence the desirability of as large an arc of contact as possible. The best way, then, to do this is to use the smooth side of the belt in as flexible condition as possible. Flexibility is a great aid in allowing the entire belt surface to come in intimate contact.

My last argument is this: Manufacturers of two or three-ply belts always make both sides smooth, making it impossible to run the belt flesh side next. It would be possible, of course, to make two-ply belts in such a way that both sides would be flesh sides.—N. G. N., in Barrel & Box.

## Operating Mortice Chains

A few days ago we had visitors at our mill. Who they were or what they were does not matter to you or me. As they went around from one machine to another, watching the various processes in furniture manufacturing, I noticed at once that they were not unused to the noise, dust, or sights of a machine shop. They did not put their hands over their ears, nor did they keep flicking the dust off their clothes with their gloves. Evidently they came to have a good look around, and asked intelligent questions on various items and machines, etc. It was the chain mortiser, however, that seemed to interest them most. We were doing some heavy cutting at the time—deep mortises in hard oak—and that tickled them to see her walk through it. After watching her do her bit, I was asked the old question: Do you have trouble with chains breaking? None whatever, I answered. Then they told me they had seen a great many and had often been told they were expensive machines to run on account of so many chains breaking. Also it required great skill on the part of the operator to handle them economically. I laughed at their fears, and showed them some fast cutting with a ⅜ in. chain, even advancing the work along with the chain in the cut. Then they saw and believed that the machine and chains would stand hard usage if they were both in good order. I told them we had used the machine almost continuously for three years and had never broken a chain, but showed them two chains that were used up, ground through to the pins, yet all teeth were in good shape. Grind often and light, and grind under to have a keen edge, with plenty of hook to it. It keeps sharp longer and is easier on the belts and chains. I do not think a fool can get good results from a chain mortiser any more than any other machine; still, any level-headed mechanic can keep her singing the right tune if he is given a few pointers for guidance now and then. No one need have trouble with a chain mortiser if they have a good machine and look after it. —J. M. N.

## Speed of Circular Saws for Hardwoods

A speed of 9,000 ft. per minute at the points of the teeth for ripping, and 10,000 ft. for cross-cutting, has for many years been accepted as a standard for circular saws. These speeds are all right for sofa woods, but in my opinion they are too high for hard woods, and cause undue wear and bluntness on the saw teeth. I am aware that most mills run their saws at the same speed for both hard and soft woods, but after various experiments I have come to the conclusion that for hard woods the above speeds can be reduced with advantage, for instance, for cutting oak, say a reduction of 1,000 ft. per minute, and for that difficult wood, hickory, 2,000 ft. with the hook and set of the teeth reduced in proportion. I should be glad to hear the results of my readers' experience in this connection, as, although I have had forty years' experience in wood conversion, I am just beginning to find out how very little I know—Senex.

## New Idea in Fuming Oak

Mr. Rudolph Kilbourne, writing in the Woodworker on fuming oak, says:—"A few days ago I dropped into one of the largest and most up-to-date furniture factories in the country, one that turns out a large quantity of high-class fumed oak, and there I got a new idea regarding the fuming process. The usual way of evaporating ammonia for fuming has been to allow it to drop from a tank outside the vat on to a series of slides inside, and finally into a jar on the floor, this dripping process extending over a period of from twelve to twenty-four hours. The new method is to place in a long, shallow pan about one-third the quantity of ammonia usually required, and place this over a coil of steam pipes. The advantages claimed for this way over the old method are that a more uniform color is obtained, the work is done in half the time, and much less ammonia is required. I have not yet tried it out myself, but from what I saw in that shop am convinced that the thing is a success, and I pass it on for readers to try out for themselves."

## British North-America Wood Charter

It was announced some days ago by the Secretary of the Documentary Committee of the London Chamber of Commerce that a new form of charter party for deal and other wood cargoes from British North America had just been issued, and that it would become operative on April 15th next. It is further understood that some business has already been done through London timber importers on the new charter, but Liverpool timber merchants are entering an emphatic protest against it, and resolutely decline to accept it as the basis of business, their contention being that the terms and conditions stipulated for are too complicated and totally unsuitable for the requirements of the trade in general, and they further aver that they are finding no difficulty whatever in getting offers of tonnage and chartering on the old Conform A.

# Review of Current Trade Conditions

### Ontario

A large Canadian wholesale lumber dealer who has recently spent the greater part of the month in visiting consuming and producing districts in many parts of the province expresses the opinion that the lumber trade today in Ontario is in a transition state and that he does not know exactly what to say in regard to the outlook. The retail trade bought stock to a fair extent during the winter and accumulated a fair assortment of stocks, the idea being to carry in their yards sufficient stock to be ready for improved trade if it should come in the spring. The spring found the retailers with stocks of this nature and very little building demand developing, the result being that retailers have sufficient stocks to carry them along for a short time with a good demand or for a longer period if the demand continues quiet.

Referring to the course of events during the past fall and winter this wholesaler said that as soon as the war broke out trade became light and retailers reduced their stocks to a minimum. At the end of the year stocks in the hands of retailers were very light, and assortments were badly broken. After the first of the year retailers found it advisable to put in small assortments of stock. They now find that there is very little ready sale and therefore the retailers are not an important purchasing factor today. Whether they will become so during the summer is something which will depend entirely upon factors which cannot be foretold.

Manufacturers kept their stocks down after the war broke out and waited quietly, for several months, watching the course of events Another wholesaler who has recently made a visit throughout southwestern Ontario reports that manufacturers, particularly furniture producers, are coming into the market again to a fair extent. One very large furniture manufacturer recently was considering plans for closing down his plant. Before doing so he paid a visit to the prairie provinces, where he secured so many good orders that he decided to go ahead with his manufacturing operations. With this manufacturer, practically all the dry stock he owned was then in his kiln and he had to come into the market immediately with a substantial order. Other furniture manufacturers are also reported to have only small stocks and they will have to buy if orders commence to come in for their product. This wholesaler reports also that the yard trade is very quiet. He believes, however, that most of the yards have very little stock on hand and will also have to buy if trade picks up. Reports from mill points indicate that stocks are fairly well picked up, with the exception of a few mills where there are fair amounts of white pine of all grades.

Manufacturing operations at Ottawa are about in full swing at all the mills. A definite improvement is reported in trade in the Ottawa district.

### Eastern Canada

Slightly better conditions are reported in the lumber trade at Montreal. Orders are developing more freely and wholesalers are more cheerful than they were a short time ago. There is no likelihood of anything in the form of great activity, but a fair increase in the demand is expected. No large buildings are under contemplation; the permits being all for residences and alterations. The United States demand is improving. The trade in sash and doors shows a slight increase, but is still far below normal. The outlook for spruce in Great Britain is promising, but reports in regard to pine are not encouraging. Lists of sailings for the month of May, which have been issued by the steamship companies, are considered to be fairly satisfactory, in view of the world-wide scarcity of tonnage.

The demand for dimension spruce at Boston is improving. During the past fortnight it has been noticeably better. Producers are asking $24.50 for 8-in. frames, Boston rate. The demand for random is good and quotations are about 50 cents higher than they were a month ago. The board market is weak on account of heavy offerings of southern lumber at rather low prices. Spruce covering boards, 5-in. and up wide, 8 ft. and up long, are bringing only $20 and matched boards, 10, 12, 14 and 16 feet are selling at $22.50 to $23. There is a better movement of shingles at Boston, but there is still room for much improvement. Most of the demand is from country yards. White cedar extras are offering at $3.30 to $3.40, clears at $2.80 to $2.90 and second clears at $2.50 to $2.60. The demand for spruce lath is good and prices are steady. Most producers are quoting $4.20 to $4.25 for 1⅝-in. lath. For 1½-in. there is a satisfactory demand, with $3.75 as the lowest price and $3.80 being more frequently quoted.

### Great Britain

Since the removal of the embargo on Swedish wood by Germany, there has not been the reaction in prices which was at first expected. There are many merchants who now predict that prices will come down, but those who are taking a longer view of affairs are not assuming that Swedish Baltic shipments will reach England without hindrance. They expect that there will be a very large shortage in the North of Europe wood exports. Unless Germany loses command in the Baltic, or the war comes to an end this year, the market will be short all season of Russia and Finland shipments. These shipments in normal seasons amount to over 1,500 standards. Even with a great decrease in total consumption during the war there can be little doubt that the diminution in stocks arriving will be even greater, so that it is difficult to see how anyone can reasonably expect a slump in prices. The actual f.o.b. and c.i.f. business now going on is on an extremely limited scale.

The spot market at London has been rather quiet. Dock stocks on the first of April, including all descriptions of deals and battens, pine and spruce, were nearly sufficient for three months' consumption on recent lines, but in floorings and log timber a great shrinkage was shown. The deliveries at London docks for the week ending April 3rd were quite normal, amounting to 3,471 standards, as compared with 3,983 standards during the corresponding week of 1914.

Arrivals at Liverpool have been on about a similar scale with those of previous years. The timber imported has been on a good scale, including several soft woods, among them parcels of spruce from St. John and Halifax. Stocks which have been hung up at Liverpool on account of the inability of the railroads to handle all the freight received, have lately been sent forward and the congestion is greatly relieved. At the conclusion of the first three months of the present year soft wood stocks at Liverpool were shown to be about half what they were at the corresponding period last year, the reduction being chiefly in cheap pine, birch and spruce, the imports of which, during the past three months have been insignificant as compared with normal times. The consumption, however, has been in excess of that for the corresponding period of 1914. One of the most prominent items in the monthly list of Liverpool stocks is pine deals, which amount to 1,030 standards, or nearly three times the normal quantity at the corresponding periods in previous years. These stocks, however, are largely of the lower qualities which are being used as a substitute for spruce deals, stocks of which, both at Liverpool and Manchester, are abnormally low. The disorganization of the ocean freight market is being felt greatly by those engaged in the importation of wood from Atlantic Coast ports in North America.

The spruce spot market at Liverpool is very firm and the indications are that consumers will have to face further increases in price later on. Consumers are reducing their stocks to a minimum before purchasing and will not be in the market for large quantities when they do buy. There has been a fair movement of birch at full values. These have been on f.o.b. terms with the rate of freight fixed, usually at a very high figure. Spot demand is better than might be expected. Stocks of logs are practically nil, and planks and boards are growing very scarce.

Stocks of timber at Manchester are much lower than the average. The consumption keeps up well. Large increases are shown in the consumption of Quebec waney board pine. Deliveries of spruce amounted to 2,251 standards for March. This is very little below the figure for March, 1914. Spruce deals have been reduced to below 2,000 standards. Stocks of pine deals are also low.

### United States

Conditions in the lumber trade in the United States during the past fortnight have given strong evidence of the fact that although many important factors are present for the production of trade activity, a continued increase in volume is not to be expected. A short time ago it looked as though a steady advance might be looked for. On top of this there comes, however, a period of reduced activity accompanied by wide variations in the course of trade in different parts of the country. The most encouraging reports during the past fortnight have been from sections that are most closely in touch with the manufacturing states of the north and east, such as Illinois and the New England Coast. The demand for war material is apparently having an appreciable effect in these districts. Throughout the west there are also fair indications of a buying movement on the part of

View of Mills in Sarnia.

# BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

***"Rush Orders Rushed"***

**SARNIA, ONTARIO**

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

the agricultural communities which have been enjoying prosperity for some time past. There is nothing in the form of a building boom throughout the country, but there is a fair development of the building trade. The demand for northern and southern pine and for some hardwoods for boxing and crating material is fairly good.

Stocks of lumber in retailers' hands, generally speaking, have been depleted. The public have been economizing for so long a time that it is believed that a revival in retail trade in all important necessities is about to develop. Some relaxation in the economy of the public is in evidence and is having an effect already upon trade. There is evidence of a better demand for box and crate lumber. Moreover, the demand for these goods in connection with the shipment of war materials is very considerable. Factories also are reported to be using larger quantities of lumber. Unemployment is noticeably reduced in many parts of the United States. Industries are gradually opening up. Although present trade conditions are somewhat less active than a fortnight ago, there are decided indications of a revival in the near future.

# Market Correspondence

**SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD**

### Montreal Market Report—Spruce Exports Likely to be Heavy

Montreal, April 22nd (Special to the Canada Lumberman):—While it is too early to speak of any decided improvement, there are signs of better conditions in the lumber market. Orders are coming in more freely, and there is a more optimistic feeling among wholesalers. No one expects anything in the shape of a boom, but many believe that we shall see a considerable increase in the demand, even allowing for the usual gains in orders during the spring and summer seasons. Practically all the building permits are for residences or for alterations, and most of them are for comparatively small amounts.

Trade with the United States is picking up, one firm having recently booked an order for over a million and a quarter feet of spruce.

Although by no means brisk, business in sash and doors and interior finish has improved. It has, however, still considerable leeway to make up before it approaches normal.

With regard to the import duty of 7½ per cent. imposed by the Government, some firms have been able to make a compromise with United States manufacturers on orders given previous to the imposition of the duty; others have refused to pay a cent, claiming that they are not liable under f.o.b. Montreal shipments; and others have paid the duty, the sellers objecting that the duty is, strictly speaking, a war tax which ought to be borne by Canadians. The payment or non-payment seems to have been largely a matter of circumstances, and certain local wholesalers have incurred losses rather than jeopardize future business relations.

The outlook for Canadian spruce in the British market is decidedly good, but that for pine is not very cheerful. Reports from the other side are not encouraging for pine and it is probable that the coming season will witness a considerable diminution in these exports. The talk is all of spruce and of the chances for getting sufficient freight space to carry the large stocks sold for United Kingdom account. It is believed that the Old Country can easily absorb whatever Canada can offer, in view of the impossibility of getting supplies from the Baltic. The steamship companies have issued their May lists of sailings, and these are, considering the scarcity of tonnage, very satisfactory, so far as number is concerned. A report from Liverpool states that the dock porterage charges have risen from 1s. 3d. to 3s. 9d. per ton.

### Ottawa Mills Starting—Trade Improving

Ottawa, April 21st (Special to the Canada Lumberman):—J. R. Booth opened his sawmill for the season last Monday in a limited way, but by the end of the week he will have it going to its full extent. He would have begun operations earlier had not the large flume at the plant broken a week ago last Sunday. This not only handicapped the opening of the sawmill, but flooded out the power house and one of the pulp mills and interferred with other parts of the plant considerably, with the result that it threw about 1,000 men out of work temporarily. Repairs to the flume were undertaken without delay and completed last Saturday.

Shepard and Morse will open their mill at the end of this week for the season, which will give employment to about two hundred men and will thus help to relieve the unemployment situation in Ottawa and district, which is acute just now. All the mills in this district will be working by the first week in May.

Trade is picking up with spring definitely here, and the outlook is rather encouraging. The water in the Ottawa is rising and altogether conditions are not such that lumbermen need to be pessimistic, even though there are no signs that the war will be over for some time to come.

The aftermath of a contract made with the Maclaren Lumber Company, of Buckingham, Que., was aired in the Hull criminal courts last week. Damas Gauthier, a farmer living near the Lievre River, entered into a contract with the company to drive logs on Severn Creek into the Lievre. The company found that his work was not being done satisfactorily, so J. Whitfield, a foreman for the Maclaren firm was instructed to take the contract over. Whitfield with his men went to get some of the company's logs piled alongside the creek on Gauthier's property, whereat the latter, it is alleged, got a rifle and fired at Whitfield, narrowly missing him. Gauthier's arrest followed. The case is still before the courts.

At a recent sitting of the Railway Commission the C. P. R., and other railways sought to obtain permission to have their responsibility for bush and forest fires reduced. Under the present rules of the Board the railways are liable for damage done by fire caused within three hundred feet of the track. They wanted their responsibility confined to the edge of their right-of-way. The application was opposed by Mr. Clyde Leavitt, Chief Forester to the Commission, and the Board decided to let the rules remain as they are.

A large part of the money subscribed to purchase instruments for the band attached to the 38th batallion of the second Canadian contingent, came from lumbermen in Ottawa and district. The commanding officer of the batallion is Lt.-Col. C. M. Edwards, of the lumber firm of Watson and Todd, and nephew of Senator Edwards, head of W. C. Edwards & Company, Limited.

The death occurred ten days ago of Mr. John C. Browne, of Ottawa, well known in lumber circles, in his 69th year. For many years deceased was a member of the Union Forwarding Company, and, when that concern wound up, he went into the commission and brokerage business, acting for several of the lumber firms in the city and district. He was also connected with the Fraser Lumber Company.

### Glasgow Quarterly Market Report

Calder, Henderson & Livingston, Glasgow, in their quarterly timber market report, under date of April 1st, say:—Canada—St. Lawrence.—Yellow pine—waney—While the demand generally was very quiet, some enquiries traceable to Government requirements were in evidence, but these were supplied from Siberian logs of more attractive specification and price. Pressure of naval work, which calls for the minimum of timber, caused a dislocation of the ordinary consumption in the shipyards and stopped deliveries of purchases completed at the end of last year, hence the poor consumption of only 40 logs for the quarter. The stock is low and largely held by merchants and shipbuilders. First class deckwood of good scantling is firmly held and values are about in line with the present high import cost, but the smaller wood is difficult of sale unless at a low figure. Second class timber and square wood of any quality were not enquired for and there is no stock.

Elm.—Enquiries were not numerous, and the consumption was very moderate. First class wood only was asked for, and large sided logs sold at a high figure. Smaller timber was firmer in value. Second class wood and grey elm were stagnant and values were barely steady. Stocks, apart from first class, which is lightly held, are too heavy.

Oak.—There was little movement. Stocks of first class are held by merchants and are more than ample for present wants, but values are firm. Second class wood went at a low figure in competition with United States logs.

Ash.—Was not asked for.

Birch—logs.—No arrivals. The demand was strong, but in the absence of supplies few transactions were recorded. Values advanced and are now at a high level. Forward buying has been done at 2s. 1d. ex quay for 15-inch average on a freight basis of 70s. per std. The stock on the tables solely represent round wood stored on consumers' account. Planks—Experienced a steady enquiry at steadily advancing figures. Stocks are moderate and are now held by merchants and con-

sumers. No. c.i.f. transactions have been reported, buyers, owing to the freight position, holding aloof meantime.

Deals, battens and boards—pine.—There was no import, and with the exception of 1st pine sidings, sales were practically transacted through merchants who held the stock carried over from the end of last year, and the figures realized were on a retail basis. A strong demand, chiefly for the lower qualities, resulted in a satisfactory consumption and the stock is now at a low ebb. Values of 1st quality deals were firmer, and the lower qualities showed a marked advance First pine sidings were in occasional request and sold at from £32 5s. to £35 per St. standard for 12 to 14 inch average. The stock is now in a healthier position, although ample for present requirements.

Red Pine.—Wtih housebuilding so quiet they were seldom asked for. Values have risen and buyers who have been using them for box-making purposes have returned to spruce, preferring the latter at the now slight difference in price.

Spruce.—The consumption was a good one, the demand running chiefly to the wider deals, 9 inches and up, and also 6 inch. Values owing to the steady enquiries and increasing cost to import advanced and are now at such a high level that purchasing has become restricted. The demand also is somewhat quieter at the moment. Stocks are low and at present the prospect of them being increased to any material extent is unlikely.

New Brunswick and Nova Scotia.—Birch—logs—No arrivals. These are wanted and good prices are obtainable. There is no stock. Planks.—Moved well into consumption. Prices were firm and have advanced. The stock remaining for sale is very low.

Deals and battens—pine.—The position has improved with the scarcity of the lower qualities in Quebec deals and values are higher.

Spruce.—The strong demand prevailing absorbed practically the whole of a fairly heavy import which went well into consumption owing to the large amount of government work on order. Values rose and were maintained on a high basis, and their movement will largely depend on the freights and the position of North of Europe goods. Government enquiries are reported now to be scarcer.

## Liverpool and Manchester Stocks

## Glasgow Market Report

Messrs. Cant & Kemp, Glasgow, in their timber market report under date of April 2nd, say:—Business during this quarter has been different from anything previously experienced, the chief work in the large industries being the production of munitions of war. All kinds of naval craft, mines, shells, motors for transport, and other materials, are being turned out in growing quantities and this is only likely to decline when the war ends. Notwithstanding all this, shipbuilders have been well employed and the tonnage launched is greater than was expected. It is however to be feared that this may not be maintained. Wagon builders have also been fairly well employed, chiefly with war materials and transport. Housebuilding shows no change, while the demand from the cabine industry continues slow and disappointing.

Quebec yellow pine waney boardwood.—The demand is slow. The stock is entirely in merchants' hands. Prices are fairly firm.

Quebec red pine.—The stock of timber is nil, with no enquiry. The stock of deals is very small. Prices are firm.

Quebec oak.—The stock is somewhat reduced, with a limited enquiry, chiefly for first class parcels. Prices are firm, and may be quoted from 3s. 6d. to 4s. 9d. per cubic foot, according to quality and specification.

Ash.—The stock of logs is very small, with a fair demand. The stock of planks is light, with a limited enquiry, chiefly for first class lots of good specification. Prices are firm, and quotations may be given for logs, 2s. 9d. to 3s. 6d., and for planks and boards 3s. 6d. to 4s. 3d.—according to specification.

Birch.—The stock or logs is very light as well as that of planks and boards. Prices are firm, and with high freights, stocks will not be easily replaced.

Quebec yellow pine deals, etc.—The stock of all grades is light and mostly in merchants' hands. The demand has been largely for the lower qualities, the better grades of both deals and sidings having only had a limited enquiry. Canadian goods are very firm and may be quoted as follows, viz.:—Firsts—Broads, 5s. 3d. to 6s.; regulars, 4s. 10d. to 5s. 3d.; undersized, 3s. 6d. to 4s. 3d. Seconds—Broads and regulars, 3s. 8d. to 4s.; undersized, 2s. 8d. to 3s. Thirds—Broads and regulars, 2s. 7d. to 3s.; undersized, 2s. 2d. to 2s. 4d. Fourths—Broads and regulars, 2s. 1d. to 2s. 3d.; undersized, 1s. 9d. to 2s. Good sidings, 4s. to 5s. 6d.—all per cubic foot according to specification.

Quebec Spruce Deals.—The stock is moderate with an excellent enquiry. Values are high. Quotations are—9 inch and up, 2s. 3d. to 2s. 6d.; 8 inches and under, 1s. 10d. to 2s. 1d.—all per cubic foot.

Lower Port Pine and Spruce Deals.—The stock is very similar to what it was at the end of December, with high prices. Quotations are—9 inch and up, 2s. 1d. to 2s. 4d.; 6 to 8 inch, 1s. 9d. to 2s. per cubic foot. The stock of Riga goods is small and quotations are from 2s. to 2s. 4d., according to specification.

## The Practical Evinrude

Many lumber manufacturers and loggers, whose business interests them in the towing of logs and supplies, and the carriage of workmen by water, will be interested in the advertisement of the Evinrude Detachable Rowboat Motor, appearing in the Canada Lumberman. The Evinrude Rowboat and Canoe Motor is not merely a pleasure machine. It fills many requirements in the field of practical operations, and is today used from Cape Horn to the Land of the Midnight Sun in practically every civilized as well as many uncivilized countries of the world. Its principal feature is that it is detachable, that is, it can easily be fitted (clamped with two thumb screws)

The Practical Evinrude Motor.

to any boat. Its peculiar position, outside of the stern, offers the advantage that the entire capacity of the boat can be utilized for carrying cargo, or passengers. The 3½ h.p. Evinrude, for instance, will readily handle boats loaded with 8 tons or more, while for towing purposes its power is remarkable.

The Evinrude Company have received innumerable testimonials from users who have used the Evinrude to tow other craft, some of these endorsements being almost unbelievable. Among the testimonials are many from engineers and contractors referring enthusiastically to the efficiency of the motor under widely diverse circumstances. Twenty-two national governments have adopted the Evinrude motor for war, navy and lighthouse service, which is an indication of the dependability of the machine. The built-in magneto is sea and weather proof and the automatic reverse makes possible the manoeuvring of an Evinrude equipped craft as may be desired. All machines have the famous Maxim silencer.

The Evinrude is a practical, durable and reliable motor, for lumbermen, foresters and contractors. It is powerful for towing and can be hooked right on to a scow, barge or float.

The Standard Planing Mill Limited, North Bay, Ont., has secured a charter.

The Peterborough Lumber Company, Peterborough, Ont., commenced operations at their saw mill during the second week in April.

The Township Council of York, Ont., have instructed Commissioner Snider to secure tenders for lumber and nails to be used in township work.

The planing mill belonging to the Bryan Manufacturing Company, Collingwood, Ont., was recently destroyed by fire, the loss amounting to about $50,000.

The Rathbun Match Company, Limited, have been incorporated with head office at Deseronto, Ont., and capital stock of $125,000, to manufacture matches.

R. Lockhart & Company, Rocky Inlet, near Fort Frances, Ont., reopened their sawmill on April 19th and expect to be operating all summer at full capacity. The mill employs 75 men and cuts timber and ties.

John Piggot & Sons planing mill at London Street, Windsor, Ont., was recently destroyed by fire. The loss is estimated at $50,000. The company will probably rebuild, and will purchase new machinery at once for temporary quarters.

The Rat Portage Lumber Company, Kenora, Ont., started their sawing operations during the third week in April. The company carried over a large quantity of logs from last year and with the output of the last winter they will have enough to keep the mill running night and day this summer.

The Biebel Furniture Company, Limited, has been incorporated with head office at Stratford, Ont., and capital stock of $50,000. The incorporators include Chas. Biebel, D. E. Weir and W. Ruttle, all of Hanover, Ont. The company's powers include manufacturing and trading in lumber, furniture, and builders' and contractors' supplies.

The Keewatin Lumber Company, Keewatin, Ont., started cutting cull ties into lumber and making lath, about the middle of April. Their sawmill was started for the season about a week later. The company have a large stock of logs in the water and will operate throughout the season. It is possible that they may run both a night and a day shift.

The sawmill belonging to Wm. Pedwell, Owen Sound, Ont., was destroyed by fire on April 17th. The loss is estimated at $10,000 and there was insurance of about $3,500. The mill had been in operation for some time cutting shingles. Preparations were under way for opening the plant for the season's operations. Mr. Pedwell has not yet determined whether he will rebuild.

The large flume which controls the water at the J. R. Booth mills in Ottawa, recently broke. The power house and one of the pulp mills were flooded and much damage was done by the water. On the following morning the plant was to have commenced summer operations. The accident caused a delay of a week, during which the large staff of employees had to remain idle.

The Pigeon River Lumber Company, Port Arthur, Ont., will commence sawing about May 15th and expect to continue until fall, operating two shifts. The company have about 4,000,000 feet of logs in the bay opposite the mill, and about 6,000,000 feet of last year's cut boomed in the river.. They cut during the past winter from fifteen to twenty million feet which is now in rafts ready to be towed to the mill.

The Shevlin-Clarke Company's mills at Fort Frances, Ont., commenced operations for the season during the third week in April. Operations will be continued throughout the season. The larger mill will run during the day time only, and mill No. 2 will be operated day and night. About 500 men will be employed. It is expected that the two mills will cut about 70,000,000 feet this year, as compared with 100,000,000 feet last year.

The Woodworkers Accident Prevention Association has been incorporated, with an Ontario charter, the head office being at Toronto. The provisional directors are W. B. Tindall, W. C. Laidlaw, W. C. Irvin, Dwight J. Turner and H. S. Cane. The object of the Association is to promote the prevention of accidents in the woodworking industry and in any other industry which may be assessable by the Workmen's Compensation Board of Ontario in the same insurance group as woodworking.

## Eastern Canada

Louis Bouchard, St. Paul's Bay, P.Q., recently suffered loss by fire at his sawmill.

The General Interior Woodwork Company, Montreal, P.Q., has been dissolved.

J. E. Moranville, general store and lumber dealer, Nominingue, P.Q., has sold out his stock.

The Starke Cooperage Company, Montreal, have sold out to the Paxton Cooperage Company.

G. Walter Bowen, manufacturer of doors and windows has been registered at Beebe, P.Q.

The Shepherd & Morse Company are operating a new mill in the district called L'anse aux Cousins, P.Q.

Mr. D. J. Buckley has purchased the T. W. Flett mill property in Nelson, N.B. Mr. Buckley's last winter's cut was twelve millions.

Kubelik & Bissonette, lumber and real estate dealers, Montreal, P.Q., have been registered. S. Max Kubelik, 263 St. James Street, Montreal, is one of the partners.

"Robinson Limited," have been incorporated with head office at Millerton,

N.B., and capital stock of $199,000, to carry on and operate a general business. The incorporators include James Robinson, W. Robinson and H. A. Frank, all of Millerton.

The Camwick Lumber Company, Limited, has been incorporated with head office at Montreal and capital stock of $50,000. The incorporators include G. L. Alexander, E. Lafontaine, H. J. Murphy, H. Hughes and Geo. Burnett, all of Montreal.

The Ed. Partington Pulp & Paper Company, Limited, of St. John, N.B., are operating a sawmill this season at Napudogan, N.B., on the Transcontinental Railway. This mill is equipped with a rotary gang having a capacity of five million for the season. It will cut principally hardwoods.

Under the name of the Boston and Montreal Lumber Company, Mr. J. Henry Poulin and Mr. Oscar F. Berthiaume, formerly of the Canada Lumber Sales Company, Limited, have opened an office in the Dominion Express Building, St. James Street, Montreal. They will conduct a wholesale lumber business.

The M. F. Schurman Company, Limited, Summerside, P.E.I., who lost half of their plant by fire last fall, report that they have not yet definitely settled their plans for rebuilding, but expect to put up a brick building and to pay special attention to making it fireproof. They will make considerable increases in their floor space. The company carry on business as contractors, manufacturers and lumber dealers.

## Western Canada

Hafenbrak & Stein, planing mill operators, Dauphin, Man., have been succeeded by C. B. Stein.

The Standard Lumber Company, Limited, Killam, Alta., has been incorporated with capital stock of $10,000.

James White, lumber and hardware dealer, Carberry, Man., has sold his hardware business to B. McCormick Limited.

The Turnour Island Logging Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $25,000.

G. S. Richards, 14th Avenue East, Vancouver, is planning to engage in tie manufacturing, and will probably start up a small mill somewhere in the Fraser Valley.

The Prince Albert Lumber Company, Prince Albert, Sask., have commenced operations for the season and are giving employment to between 400 and 500 men.

The Weeks Dunell Cedar Company, Limited, Union Bay, B.C., are applying for approval of plans and site for a shingle mill, wharf and booming grounds, at Fanny Bay, Vancouver Island.

The Ladder Lake Lumber Company's mills at Big River, Sask., opened on April 19th. The resumption of sawing there for the first time since the mills were burned down two years ago will be welcomed throughout Northern Saskatchewan.

The Okanagan Saw Mills, Enderby, B.C., have started sawing. It is the intention to employ only white labor. The planers have been in operation for the past six weeks and the company report that the lumber market gives promise of a busy season.

The partnership formerly conducted under the name of the Grande Prairie Lumber Company, at Grande Prairie, Alta., has been dissolved by mutual consent. The partnership will be carried on in future by Alfred Johnson and James E. Van Horne.

Sealed tenders are being received by the Minister of Lands for British Columbia up to May 17th, for the purchase of License X167, to cut 3,308,000 feet of cedar, hemlock and Douglas fir on an area adjoining Lot 902, Heydon Lake, Range 1, Coast District. Two years will be allowed for removal of the timber.

The Otis Staples Lumber Company, Wycliffe, B.C., started their mill during the third week in April, employing about 150 men. Reports received from various ports of the district indicate that lumber is beginning to move more freely, and it is likely that most of the mills will be in operation in the near future.

Sealed tenders are being received by the Minister of Lands for British Columbia up to May 17th, for the purchase of License X234, to cut 1,423,546 feet of cedar, Douglas fir, and hemlock on an area adjoining Lot 2351, Mill Creek, New Westminster District. Two years will be allowed for removal of the timber.

Sealed tenders will be received by the Minister of Lands for British Columbia up to June 16th, for the purchase of License X405, to cut 6,868,000 feet of Douglas fir, cedar, hemlock, and balsam on an area adjoining T. S. X94, Mellin Lake, Range 1, Coast District. Five years will be allowed for removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia up to May 19th, for the purchase of License X340, to cut 1,236,000 feet of red cedar, hemlock, and balsam on an area in the vicinity of Lot 912, on Huaskin Lake, Range 1, Coast District. One year will be allowed for removal of the timber.

Comaplix, B.C., had a serious fire recently which caused a total loss of $300,000. Fourteen million feet of lumber owned by the Forest Mills, a light draught river steamer, several mill buildings, a hotel and seventeen dwelling houses were destroyed. The fire is believed to have been started by an incendiary. The cut lumber was valued at $210,000, and was insured to 90 per cent. of its value, but little insurance was carried on the buildings.

The Mackinnon Lumber & Coal Company, Limited, has been granted an extra-provincial license to carry on business in British Columbia, with provincial head office at the Home Bank of Canada Building, Fernie, B.C., and Mr. Sherwood Herchmer solicitor. The head office of the company is at 509 Herald Building, Calgary, Alta. The capital stock of the company is $50,000. The company will take over the business carried on by Arthur Mackinnon at Calgary.

## Dixon's Traction Belt Dressing

EVERY element needed to restore and maintain the "life" of a leather belt is contained in this paste dressing. It penetrates to every fibre of the belt, strengthening them and bringing back the pliability and vitality—and it gives a surface of maximum pulling power. It water-proofs the belt, too, so much as any dressing can. Send for "The Proper Care of Belts." No. 238E.

Sales Manager, The Moreau Barking Machine Co., Ltd.,
Drummondville, Que.

Rossing Machines

Dear Sir:

Acknowledging your letter 12th inst. in which you state that you have been informed by your Mechanic that we had to quit Pulpwood Barking, et al.

Facts are that the purchasing of the few machines which we did, was for purpose of educating people up and along Lines of the necessity. After having served that good purpose, we disposed of our machines, and to-day the rossing-peeling, and barking of Pulpwood increases to larger and larger extent, and that is what is desired for the market—Pulpwood outlined, and not with the Bark on.

**We are very glad to subscribe that your machines are doing very good work along Lines.** We are forwarding your letter to our C. E. & S. of M., S. B. Clement, North Bay, who may be enabled to furnish you further information and assistance of interest.

Thank you for the courtesy.

Yours truly,
J. L. Englehart,
Chairman.

**Joseph Perrault**

**Pulp Wood Contractor** **Nushka, Ontario**

Nushka Station, April 12th, 1915.

The Moreau Barking Machine Co., Ltd.,
Drummondville, Que.

Attention Mr. C. Manseau, Sales Manager.

Dear Sir:—

I must say that your machine is very good and we can easily bark 25 to 30 cords of four feet wood per day.

I have used several machines in the past, and I can certify that yours is the most satisfactory I have handled.

We have barked three hundred cords of pulp wood (128 cubic feet) per cord in eleven days.

Very truly yours,
(Signed) Joseph Perrault.

Seattle,
Washington.

Gentlemen:

In reply to your favor of recent date, making inquiry as to the present condition of our 18" "Neptune" double, water proof, belt, used to drive our dredging pump, with 150 H.P. Gasoline Engine, beg to state:

You may not remember that our dredger sank and was under water for eight or nine days. After raising the dredge and partially drying the belt and giving it a careful dressing, we were able to start the pump without a hitch. It has been over two years since the belt was under water, and we cannot tell that it has been damaged in any way. Its performance is just as good, so far as we are able to judge, as before it was under water.

We are very glad indeed to give it our highest approval, since we believe it is only just, as well as good business, to recommend goods that stand up as this belt has done for us.

Yours very truly,

RICHMOND BEACH SAND & GRAVEL CO.

# Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

# Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

# RUBBER GOODS FOR LUMBERMEN

**Belting** Our long experience in the making of Rubber Belts enables us to specialize on this line. "Monarch" "Red Strip" and "Lion" are our leading brands for power transmission. (Write for Booklet B-1.)

**Packings** "Redstone" High Pressure Sheet Packing has proved by test that it will outlast any other similar packing on the market. We make Spiral and Ring Packings, etc., that are equally reliable. (Booklet P-1.)

**Hose** for Steam, Water, etc., in various grades, made especially to give satisfactory and economical service under different conditions. (Booklet H-1)

**Fire Hose** One or more of our twenty brands of Fire Hose will be found, not only in the best equipped Factories, Mills, etc., but in almost every Fire Department in the Dominion. (Booklet H-1)

Clipper

Dryer

***Fore sight*** is nothing more than the exercise of discrimination in your business deals.

The shadow is always cast before the event, and you know the way the wind blows by—observation.

We always drum the advisability of strict investigation before buying any machine, especially veneer machines, The fact is we court it for all Coe Veneer Machines, whether for Rotary Cutting, Slicing, Clipping, Sawing, Stamping or taking Green Veneer just as it may be, Rotary Cut, Sliced or Sawed, regardless of thickness, size or variety of wood and delivering it dry, ready for the glue room, or for crating and shipment, without split, warp, check, discoloration or a polished surface,

We claim the above, but we make it easy for you to prove, in-as-much as we do not depend upon theory, but are quite satisfied with what practice makes in evidence.
If you are willing to judge by comparison and service, drop us a line and we will undertake to clearly show and fully demonstrate to you any and every type of Coe Machine, especially the ones adapted to your needs.

We are specialists, you must remember, in veneer producing machines and sixty-four years' of close observation, active work and the incentive of making Coe Veneer Machines best, has placed us in the lead and we mean to keep it.

Now figure this out—the consumption of timber is increasing, the supply is diminishing and the demand for veneers is now more than ever. Further investigation will prove to you that veneer and thin lumber production will pay better as time advances.

*Write for new edition of Coe Catalogue—the better machines for producing more and better veneers.*

# The Coe Mfg. Co.

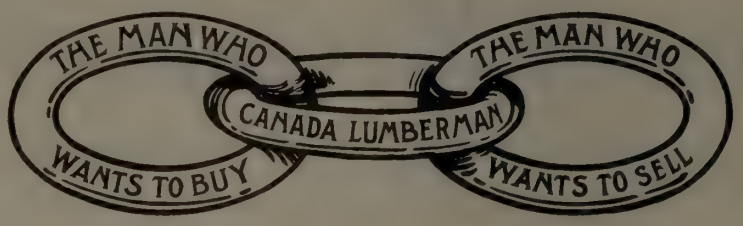
*The oldest and largest manufacturers of veneer mill equipmint in the world.*

## Painesville, Ohio



# The Connecting Link

Way back in 1880 the **Wanted and For Sale** columns of the Canada Lumberman and Woodworker were used extensively by the lumbermen of Canada for the purchase and sale of timber, lumber and machinery.

Time has but served to enhance the value of this medium, until to-day the **Wanted and For Sale Department** of the Canada Lumberman has become a national market.

Twice a month "the paper with the green cover" brings together buyers and sellers of lumber and machinery from all the principal lumbering centres of Canada and the United States. By covering this wide field, the percentage of waste circulation for advertisers has been reduced to a minimum.

For quick and satisfactory results, get your advertisement in the **Wanted and For Sale Department** of the

**Canada Lumberman & Wood Worker**

# 50% or 90% Which?

MANY mechanics are less than 50% efficient in the use of files. In the mistaken belief that they're "saving money for the firm", they use their files too long. They try to do good work with files that long since passed the "useful point."

They are only 50% efficient.

But if they took good care to discard each file when it reached the "lower efficiency" point, they would be more efficient in using files. They would accomplish more and better work—in less time—and at a lower filing-cost, that would pay you an extra profit over the cost of files.

Make your men more efficient. See that they promptly discard all worn files. And in the interest of **maximum** efficiency, furnish them with the "Famous Five."

**KEARNEY & FOOT**
**GREAT WESTERN**
**AMERICAN**
**ARCADE**
**GLOBE**
**(Made In Canada)**

World-Standard for 50 years. Produced in 5 great plants—60,000,000 a year. Yet every manufacturing process—from furnace to file—controlled by us. Every file carefully inspected—and put to exacting tests.

Solely on the strength of superior service, they hold 90% of Canada's file trade. This fact speaks for itself.

***Over 4000 different patterns—the RIGHT file for EVERY use. Let us send you "File Filosphy" and our Catalog.***

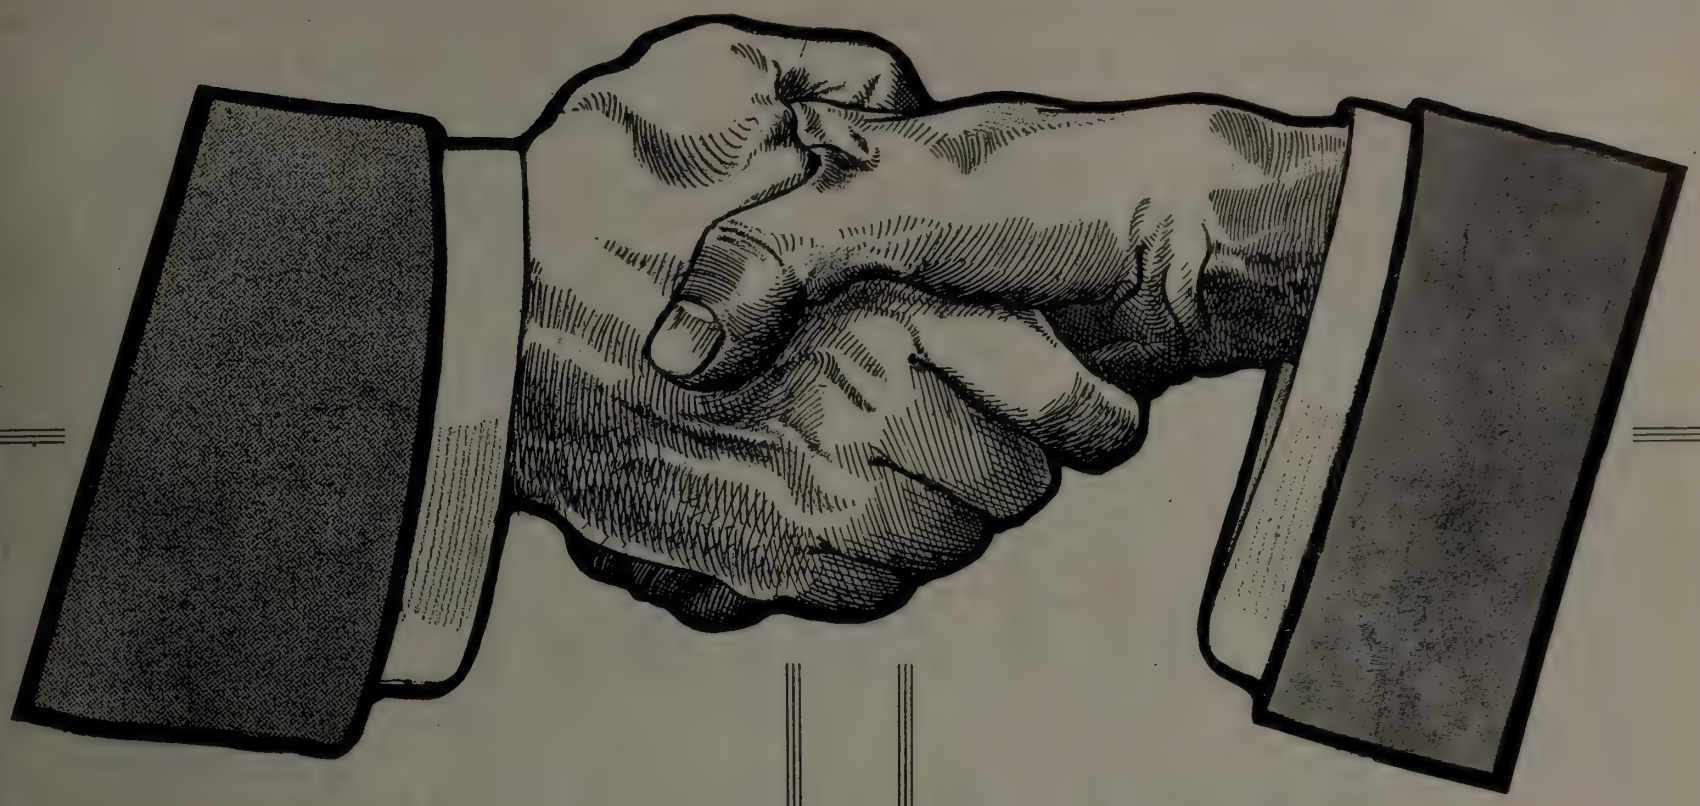
**Port Hope, Ontario**



# The Foreign Lumber Demand

Great Britain, France and other countries are finding it necessary to establish new buying connections for lumber, timber and wood products.

South America, Australia, New Zealand, Japan and China are also increasing their lumber imports. The Orient will absorb a large quantity of the world's future timber supply.

These changing conditions are daily opening up new trade possibilities which progressive lumber manufacturers have long desired.

# Canada's Lumber Opportunity

This is Canada's opportunity to secure and permanently maintain a foothold in the lumber markets of the world. We have the timber resources and the manufacturing facilities to do it. Now is the time to start an aggressive campaign for export trade.

This country should build up a large export business. The progress and stability of the lumber industy in Canada will then be guaranteed for years to come.

# Export Number

To assist in building up an export trade a ***Special Export Number*** of the "Canada Lumberman & Woodworker" will shortly be issued. The object of this number is to present clearly and effectively to foreign buyers the excellent position in which Canada is situated for taking care of large export orders.

The ***Export Number*** will be bound in an attractive cover. The contents of this number are bound to impress lumber buyers abroad and increase their interest in Canada.

Every regular subscriber will get a copy of the ***Export Number.*** It will also be mailed to lumber wholesalers and large consumers of lumber in the Eastern and Middle States and Great Britain, and to foreign countries where there is a field for Canadian lumber and wood products.

The ***Export Number*** will be a particularly useful reference number for Canadian trade commissioners in Great Britain and abroad. It will emphasize to our commissioners the high position Canada holds in the world's lumber trade.

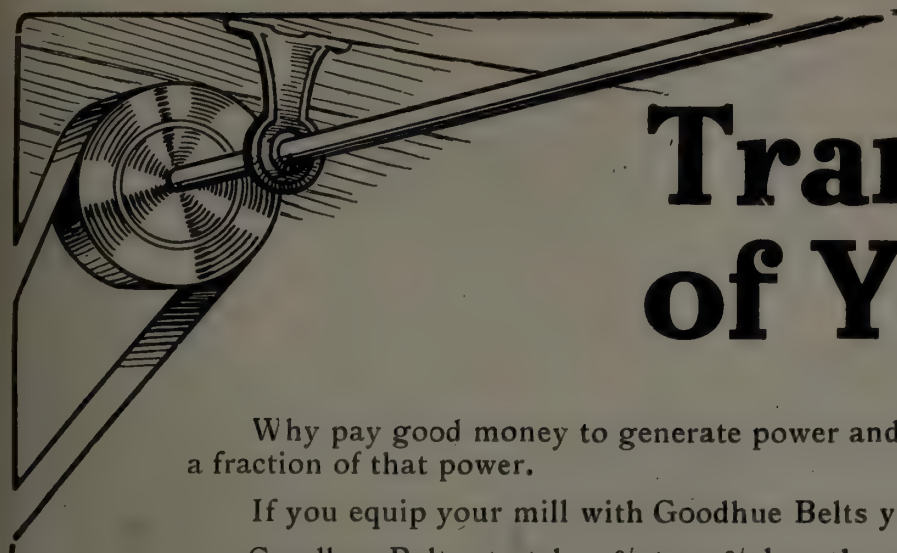
## "Wilson Bros." Flooring and Trim

"Wilson Bros." stamped on every piece of this flooring stands for Quality. Look for the name. Hardwood and Pine. **Interior Finish of All Kinds.** Also Hardwood Veneer Doors to detail. We are equipped to fill large or small orders on short notice. Write us for prices.

**Wilson Bros., Limited - Collingwood, Ont.**



# Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

*Write us for particulars and prices.*

YOU CAN DO IT WITH— **A GOODHUE BELT**

J. L. GOODHUE & COMPANY, LIMITED.
DANVILLE, QUEBEC CANADA.

OUR long experience with the particular requirements of the Lumber Industry of Canada places us in a position to give you exactly what you require for your particular work.

We have lately opened a branch at Hull, Que., where a full line of cross-cut saws, bits, holders, etc. is carried. A fully equipped repair department is in connection for the convenience of our many customers in that section of the country.

Our Vancouver Branch is similarly equipped.

You are assured ***Prompt Attention*** and ***Immediate Delivery.***

## Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

**West & Peachey - Simcoe, Ont.**

"To be, or not to be, that is the question.
Whether 'tis nobler in the mind
To suffer the slings and arrows
Of outrageous fortune,
Or to take arms against a sea of troubles." —Hamlet.

## Hamlet the Prince of Denmark is a character which

every budding actor aspires to play. The late Sir Henry Irving certainly inspired many to study the works of Shakespeare and those who were privileged to hear him in Hamlet's famous soliloquy are not likely to forget it. Most of us have been in a state of doubt on many occasions and said to ourselves: The question is:

**TO BE, or not TO BE**

We can serve the interests of our customers who use Babbitt Metals and recommend without any hesitation.

# Harris Heavy Pressure

*The Babbitt Metal Without a Fault*

*Manufactured and guaranteed by*

## The Canada Metal Company

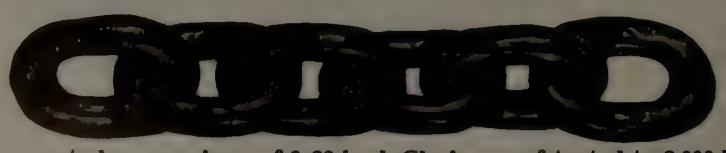
Limited

**Head Office and Factory, TORONTO**

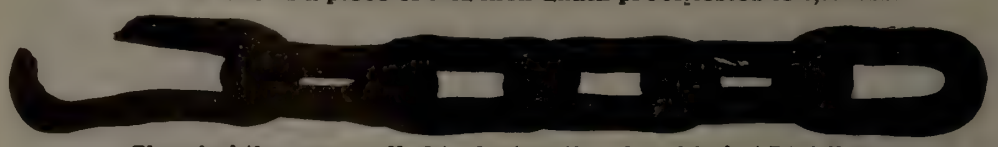
**Branch Factories, Montreal, Winnipeg**

# *Isn't This Convincing?*

**Ninety per-cent of all lumbermen in the United States and Canada use AJAX Loading Chain.**



Above cut shows a piece of 9-32 inch Chain proof tested to 3,000 lbs.



Showing the same pulled to destruction, breaking at 7,800 lbs.
(See how this Chain stretched before breaking)

Sounds like a mighty strong statement—but it isn't, it's gospel truth. And the best part of it is that the ninety per-cent is growing.

The reason for this great demand is simply and absolutely—Quality and Dependability—that feeling of sureness—that is so essential to good work.

*If you are not now using AJAX—try it on next order—learn for yourself why it's popular.*

## Standard Chain Company

Pittsburgh

# The Steam Tension Band Mill

It is called the steam tension mill because the tension is maintained by steam—the most sensitive form of tensioning which has been devised.

The result of this is a great saving in saws—**several users of the machine have run through an entire season without cracking a single saw.**

But in addition to raising and lowering the top wheel by steam, there is a separate cylinder for operating the top guide, and these two cylinders make ours an entirely steam-operated mill, and, therefore, exceptionally fast.

It is made with 8 ft., 9 ft. and 10 ft. wheels, and will stand thorough investigation.

Write for bulletin and list of users.

## William Hamilton Co., Limited

### Peterborough, Ontario

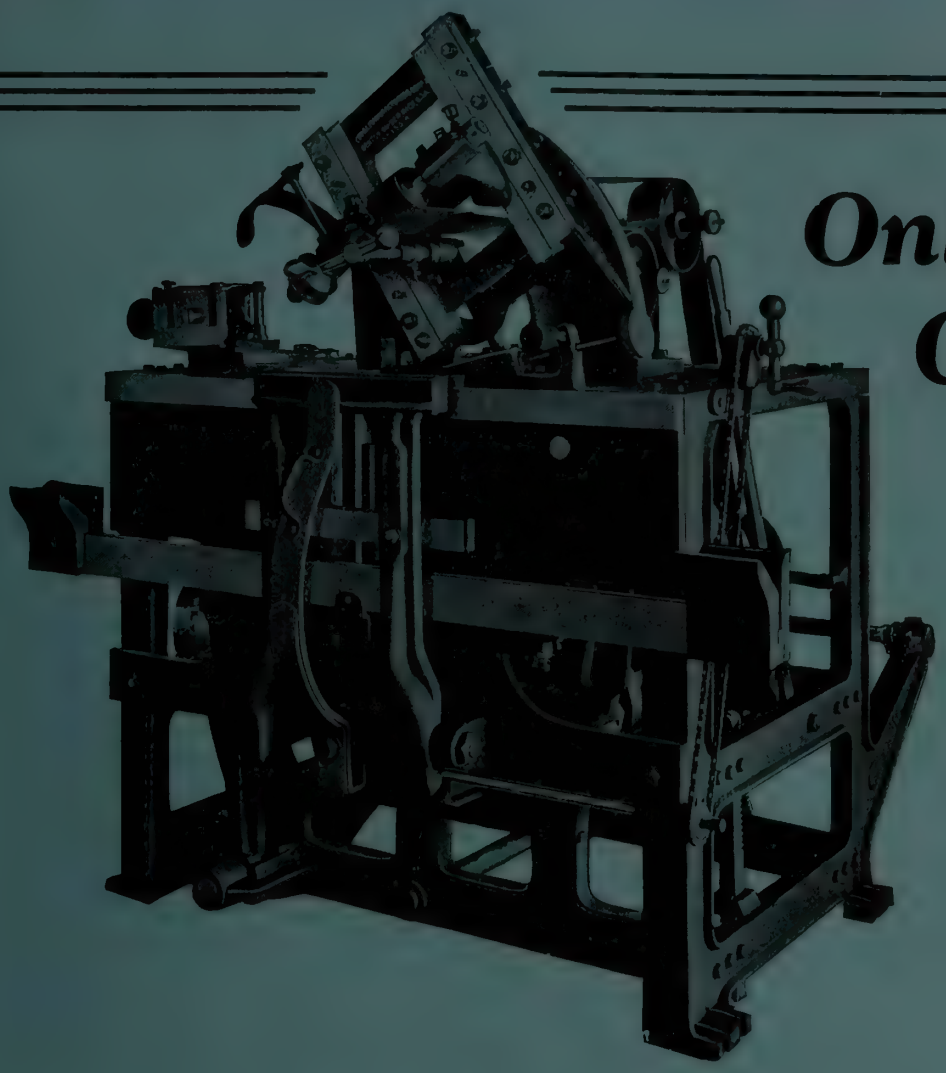
**Montreal—Williams & Wilson, Ltd.**



# *Only the Best Is Good Enough*

THE work your filer does is limited to a great extent by the equipment he uses.

Give him the kind that allows him to keep your saws in the best possible condition—and his work will be reflected in the out-put of your mill.

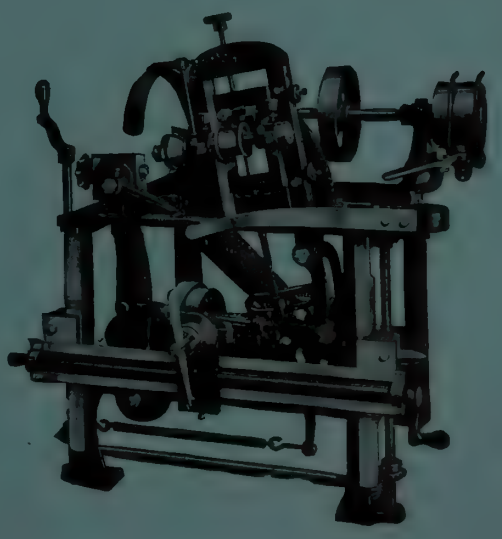
Smooth cutting, easy running saws mean smooth sawn lumber—the secret of both is—

# "COVEL" SAW FILING EQUIPMENT

## For Band and Circular Mills—Any Size

Both in Canadian and American installations, where severe saw service is the general rule, COVEL Filing Room Equipment is giving excellent results. It is producing larger cuts of better lumber wherever used. Your filer needs that kind of equipment.

We can supply COVEL Saw Filing Tools capable of handling circular saws up to 84 ins. in diameter and bandsaws up to 20 ins. wide, that will help him keep your saws in better shape at less cost than ever before.



There is only one kind of Saw Filing Equipment good enough to use on good Saws—the best. "COVEL" is the name. Remember it when you are buying Filing Room tools.

"Leather like gold has no substitute."

"AMPHIBIA"

# The Knack of Belt Making

"AMPHIBIA" belting is like a frog, having the ability to exist equally well either in wet or dry places. This quality makes it particularly well suited to the difficult runs in saw mills, pulp mills, veneer plants or where wet and green lumber is handled.

"AMPHIBIA" waterproof leather belting is pliable, firm with minimum stretch and maximum tensile strength and durability. "AMPHIBIA" grips the pulleys perfectly and transmits more of your power than other belting.

"AMPHIBIA" belting has been "Made-in-Canada" for 39 years. When ordering state where the belt is to run.

## To the Owner of Timber Lands

Far sighted owners of timber lands should take advantage of the times incident to the European wars, and prepare themselves for the day when the demand for timber is suddenly thrust upon them. This is certain to come at no distant day. Therefore cultivate a closer acquaintance with your holdings, and the best method of marketing them. Let us prepare the way for you. Remember, we not only report on the property, but assist in marketing the bond issue when necessary. Send for our booklet.

# The Foreign Lumber Demand

Great Britain, France and other countries are finding it necessary to establish new buying connections for lumber, timber and wood products.

South America, Australia, New Zealand, Japan and China are also increasing their lumber imports. The Orient will absorb a large quantity of the world's future timber supply.

These changing conditions are daily opening up new trade possibilities which progressive lumber manufacturers have long desired.

# Canada's Lumber Opportunity

This is Canada's opportunity to secure and permanently maintain a foothold in the lumber markets of the world. We have the timber resources and the manufacturing facilities to do it. Now is the time to start an aggressive campaign for export trade.

This country should build up a large export business. The progress and stability of the lumber industy in Canada will then be guaranteed for years to come.

# Export Number

To assist in building up an export trade a ***Special Export Number*** of the "Canada Lumberman & Woodworker" will be issued June first. The object of this number is to present clearly and effectively to foreign buyers the excellent position in which Canada is situated for taking care of large export orders.

The ***Export Number*** will be bound in an attractive cover. The contents of this number are bound to impress lumber buyers abroad and increase their interest in Canada.

Every regular subscriber will get a copy of the ***Export Number.*** It will also be mailed to lumber wholesalers and large consumers of lumber in the Eastern and Middle States and Great Britain, and to foreign countries where there is a field for Canadian lumber and wood products.

The ***Export Number*** will be a particularly useful reference number for Canadian trade commissioners in Great Britain and abroad. It will emphasize to our commissioners the high position Canada holds in the world's lumber trade.

# "Easy to Work"

"I landed that Everly job, Jim," said the contractor, "and of course I will want **Arkansas Soft Pine,** the kind of stock I used on the Davis house, IT'S EASY TO WORK."

"It will cost you a bit more," said the dealer.

"Worth more," said the contractor, "**it's easy to work** and IT HOLDS PAINT."

"How about the trim?"

"Everly has been educated. Plans call for **Arkansas Soft Pine** trim throughout. Mrs. Everly has worked out a color scheme for each room and knows what wood to use to get the exact effect she wants; SO YOU SELL THE TRIM."

**JUST REMEMBER: Arkansas Soft Pine is easy to work, it takes and holds paint, it may be finished to secure any wood effect the builder has in mind. Your customers want it. IS YOUR SUPPLY AMPLE?**

# Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber ands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

**We have the following Sawmill Machinery for sale:**

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

## FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

## POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

# Compare Your Present Surfacer Equipment With This Berlin-Cabinet-Surfacer

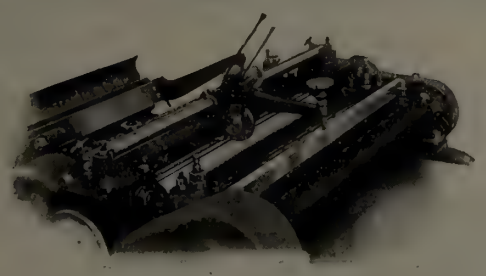
The Berlin was the first single surfacer to which thin knives, round heads and on-the-machine grinding device was applied. This was brought about by the growing need of a planer that would handle a large range of stock and produce a smooth finish that left little or nothing for the sander.

Such work resulted through the use of the round heads equipped with self-hardening thin steel knives. The direct advantage of this equipment, aside from its safeness, is that it gives a scrape cut identical with that used in finishing the finest woods by hand, and with least waste of stock pro duces a straight grain finish on cross-grained or twisted wood. The even pressure put on knives close up to the cutting edge assures a cut that will not tear grain around knots or clip the ends of short stock.

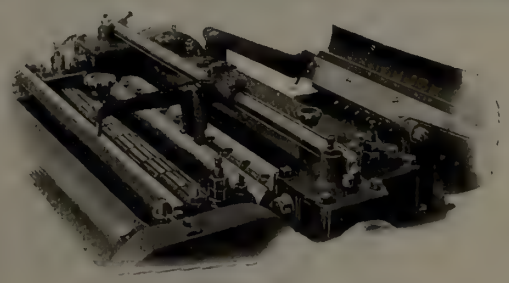
Sturdy construction is followed throughout the machine and permits of more dependable work at double the speed of the old thick knived surfacers. The production is not only double, therefore that of the maximum on the old machines, but by removing causes for the old accustomed stops that caused the knives to "dig" into the wood and prevented a smooth finish, the actual running time is made longer.

Now is the time when the saving which this machine effects will be most welcome, so now is the right time to write for particulars.

## These Set-Grind-Joint Devices Made Better Cabinet Surfacing



**Showing Grinder in position.**



**Showing Jointer in position.**

A true cutting circle is obtained while the head is running full speed, so that each knife takes off a fine thin shaving. Such a cut enables using stock that otherwise would have to be thrown out or used for low grade products. A few minutes grinding daily without the necessity of breaking your setting, keeps knives in proper condition to turn out high-grade work all the time.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 35 Toronto, May 15, 1915 No. 10

# The Export of B. C. Cedar Logs

There has been some talk in British Columbia lately about the effect of the permission to export unmanufactured cedar logs. The chief point of discussion has been as to whether it is time to replace the embargo upon the export, the idea being that the extensive movement of cedar logs across the border, which has been in progress since the embargo was removed, has resulted in so great a reduction in the quantity of logs available for British Columbia mills as to have an injurious effect upon the industry in British Columbia and to place the manufacturers of British Columbia at a disadvantage as compared with those of the Pacific Coast States. There has not been much expression of opinion as to this point, but a few British Columbia manufacturers have been insistent in regard to it and the matter is one that the Government must watch closely, as, although the export of logs is a distinct benefit at times when a surplus exists, it may work out greatly to the disadvantage of the Canadian industry if it is permitted to continue indefinitely and without consideration of the condition of the British Columbia mills. Briefly, the danger is that United States manufacturers, watching for a surplus of logs in British Columbia, will be able to purchase their logs at bargain prices and when they have reduced supplies upon which British Columbia manufacturers are dependent, they will have on hand raw material for the production of lumber at low prices, which can be shipped into Canada or compete with Canadian lumber in United States markets, while, at the same time, the removal of the surplus of logs will force Canadian manufacturers to purchase their logs at high prices, and will handicap them in competing for the trade in lumber. The periodical removal of the embargo may easily work out in this way and result in Canadian mills which buy their logs, having to pay high prices until there is a surplusof logs, and then being deprived of the advantage of low prices because the logs can then be exported.

Hon. W. R. Ross, Minister of Lands for British Columbia, expressed the Government's attitude to this matter, so far as it touches the actual situation existing to-day, when he addressed the Pacific Coast Loggers' Association rectntly during their convention at Vancouver. When the embargo was raised, Hon. Mr. Ross said, there had been 25,000,000 feet of logs in the water. Since then 77,000,000 feet had been scaled. During the same time 30,000,000 feet had been exported and 35,000,000 feet had been sawn. There was still a substantial margin left to meet the requirements for manufactured materials within the province. During February, March and April of the present year the exports of logs had been as follows:—February, 2,500,000 feet; March, 3,000,000 feet; April, 4,000,000 feet. The amount scaled during the same periods had been respectively 5,000,000 feet, 7,000,000 feet, and 7,500,000 feet. There was therefore an increasing amount on hand to meet local requirements. "It is not the intention of the Government" said Hon. Mr. Ross, "to replace the embargo until there is a more apparent need for it."

Some further remarks made by Hon. Mr. Ross in regard to other aspects of the trade situation in connection with British Columbia lumber were of interest. After referring to the Government's timber policy, he said that British Columbia had been depending too largely upon the home market. It was now necessary to get into the world markets. The United States manufacturers had succeeded in doing this. Once the industry in British Columbia was again on its feet it should have a very substantial export trade. A great deal of the success of American exporters had been due to their methods of advertising. He also referred strongly to the necessity for better shipping facilities, so as to enable British Columbia exporters to send their lumber to foreign markets on equal terms with the manufacturers of the United States.

# Toronto Trade to Have Credit Bureau

The proposal of the lumbermen of Toronto to form a credit bureau for the exchange of information regarding the standing of customers, and possibly for the handling of collections, is one of the most important matters which the Toronto trade has ever had under discussion. The indications now are that, after having given the matter lengthy discussion and having interviewed practically all the retailers and most of the wholesalers in the city some such step will be taken at an early date. At the meeting of the Lumbermen's Section of the Toronto Board of Trade held on May 7th a good discussion on the subject took place which showed that the trade is ready for such a step and will give it hearty co-operation. Co-operation is the only thing that will make such a plan work out. The whole problem is one of co-operation and can unquestionably be worked out satisfactorily if the members of the trade will simply agree to give the bureau full information and to use it whenever they require to know about the standing of a customer.

There has been a great deal of discussion at these meetings as to the situation of the wholesaler in connection with such a bureau. Some of the wholesalers in Toronto have expressed the opinion that they will not be in a position to secure any valuable information from a bureau of this nature; that it must necessarily be of value to the retailer only. They are not interested, they say, in the retailers' customers, but simply in the retailers themselves. It may be, to some extent, that this is true, but it cannot fail to work out that the formation of a credit bureau supported by retailers and wholesalers alike will result in extensive benefits to the wholesalers as well as to the retailers.

The restail trade of Toronto has many troubles to contend with, but the most serious is that which arises from the unscrupulous customer—a speculative builder in many cases who gets as much credit as he can from a number of retailers and, when times are bad, fails and leaves the whole of them in the lurch. There is a great deal too much of this and the most important advantage to be secured by establishing a credit bureau will be to make it possible to eliminate this class of man. When he has been eliminated and the irresponsible retailer also has been eliminated, who sells without question to this

class of customer, the other retailers, those who are in business to make an honest living out of it, will be in a far better position financially and in every other way than they have ever been in before. There will then be in Toronto a retail lumber trade to which it will be a pleasure to belong, and if the wholesalers of the city cannot see that they will be benefited by bringing about such a situation, they must be hard to persuade. The wholesalers of Toronto would be the envy of every wholesaler in the lumber business in all parts of Canada if they had such a healthy line of retailers to deal with.

The successful organization of a credit bureau of this nature cannot fail to benefit all those connected with the trade who desire to do an honest business. With the irresponsible retailer eliminated those who are left will be able to make a fair profit. They will be just that much better able to meet their own obligations. They will be that much more attractive to the wholesalers as customers. The wholesalers themselves will find their troubles reduced because their retail customers will be so much better able to meet their obligations and, making a better profit out of their trade will be able to buy much more steadily and satisfactorily from the wholesalers. We hope that the bureau will be established soon, and we feel assured that it will become an important influence for good to the whole Toronto trade, and not only that, but a benefit to many in the trade outside of Toronto.

# Coming Out of the Wilderness

Nothing has been more emphatically emphasized at the annual meetings of the various lumbermen's associations this year than the fact that the lumber business is suffering greatly because those who are engaged in it have not been following the examples set by many other lines of industry in the way of telling the consumer why and when he should use their products. It has taken a number of years to convince lumbermen that it is either feasible or possible to do anything in the way of educating the consumer. There have been a few pioneers in the movement who have put their faith into deeds and have proved clearly that lumber is no exception to the general merchandising rule that if you want to sell your product, you must not only make it as good as possible, but must go out and tell the consuming public how good it is and why they should use it. There was a man of a philosophical turn of mind who once made quite a reputation for himself by writing a little treatise upon efficiency, in the course of which he said something to the effect that if a man could make something which the public wanted and could make it a little better than anyone else, the world would make a beaten path to his door, even though he lived in a wilderness. This is a pretty sort of a statement, but it does not work out in practice. If you have made something which the world wants and have made it a little better than anyone else, you are still a long way from getting the world to use it. You must get upon the house tops and shout about it so long and so loud as to make the public curious. Unless you do they will not buy. They will not make any beaten path to your door, even though it be located at the most expensive business corner in your town, but they will go to the merchant in a back street for a substitute material, if he has been wise enough to understand that the general public not only wants goods to fill its requirements, but at the same time wants to be persuaded by argument and oft-repeated announcement, that it is getting the best value for its money. The facts of the case as regards the actual merits of the goods have much to do with securing and holding the trade, but no matter how good your wares may be they will not bring you sufficient trade to keep the bailiff away ,unless you let the consumer know about them and unless you do something in the way of educating the consumer to a proper appreciation of their merits, for fulfilling his particular requirements.

The lumber industry and trade for many years was living in a wilderness and fondly counting upon the public to continue for ever its natural inclination to buy lumber, but while they continued peacefully thus, their competitors bestirred themselves and insistently and ingeniously made a beaten path to the home of the consumer by way of advertising publicity and secured such a hold upon the consumer's trade that when the lumbermen awoke to the true state of affairs the damage which had already been done to their business prospects was great, and they found themselevs far behind in the race for business.

Recently, many associations of lumbermen in the United States have been giving this situation their earnest thought and have got so well to the bottom of the situation that they have already commenced to work along the same lines as their competitors. The latest movement now in existence among the lumbermen of the United States is that which has in view the education of the consumer to a better understanding of the merits of wood. It has taken only a comparatively short time, devoted to investigation, to show the lumbermen a number of important facts. They have found out that lumber consumption has fallen off in greater proportion than building construction, during the recent trade depression and that well financed organizations are working for the elimination of wood. Lumber to-day is getting only 10 per cent. of the advertising devoted to construction material. Unscientific and some times unfair building codes are unduly restricting the use of wood which is being made the target of anti-fire agitation although 85 per cent of the fire loss in the United States is due to other causes. The result of all this is that, whereas the public formerly "bought" lumber, now it must be "sold" against keen competition, and the dealer is commencing to feel that he alone should not bear the burden of selling the manufacturer's goods. In consequence of this and other features of the trade, the public is being educated away from the use of wood to such an extent that prompt steps are essential to save a large part of the present market for lumber. The only way to maintain the demand for lumber in fact, is by the co-operation of all branches of the industry and trade, in a movement to educate the consumer and promote the use of wood wherever it is the best available material or where it can be made equal to other materials for the service required.

# Remedies For the Substitute Evil

An interesting series of articles has been appearing in American Forestry, written by Mr. E. B. Hazen. In the latest issue Mr. Hazen deals forcibly with the encroachment of substitutes for wood, upon the market. Seeking to give an explanation and a solution of this problem Mr. Hazen says:—

There are so many lumber manufacturers operating under difficult conditions that it would be impossible to secure a unanimous opinion as to the steps necessary to remedy existing conditions. There is no general agreement as to what is wrong, nor thorough understanding of the economics of the situation. The lumber papers of the country have for two years given much space to an analyzation of the causes for depression in the business. To-day there is much better understanding of the problem among manufacturers, but the basis of constructive effort must be a thorough study of the question and self help by lumbermen themselves.

Only a few of the remedies which should be applied will be mentioned here. Good business can only be realized through:

1. Publicity.
2. Salesmanship.
3. Research work.
4. Initiative.
5. Better producing organizations.
6. Co-operation.

Publicity must remind the public of neglected uses for lumber. It must visualize the warmth and beauty of lumber, appealing to an inherent preference for wood in exterior design, panel effects, furni-

ture, etc.; it must show its permanent utility, its workableness, its adaptability to individual tastes, its susceptibility to remodelling and improvement to suit changing conveniences and customs; it must demonstrate the safety, superiority and lower cost of fire-proof, "mill constructed" factories, warehouses and public buildings, equipped with automatic sprinklers, and the application of the same principles in modified design to the house; it must point out the efficacy and reasonable cost of means to prevent decay in wood; and, most important of all, it must correct the fallacy that lumber is becoming scarce or timber supply exhausted.

By giving publicity to the distribution of the cost of the product, manufacturers will correct the erroneous impression that lumbermen are privileged exploiters of the nation's resources and that they receive disproportionate gains. The public must learn that lumber is the product of an industry which employs more workers than any other and ranks third in the United States in the point of capital invested. It produces two and three-quarter billion dollars' worth of merchandise annually, about 80 per cent. of which is represented by labor. The public is interested because of its ownership of national forests and because in certain sections timber pays a major portion of the taxes and public improvements. These reasons, together with a realization of the public's constant need for a timber supply, will lead to more equitable taxation, better support of fire protection laws, the establishment of a permanent national forest policy and the enactment of constructive legislation.

Hand in hand with publicity must go stimulation and satisfaction of demand by efficient salesmanship. Modern business has shown that salesmanship is more than order-taking. It involves a thorough knowledge of the product to be sold and methods of manufacturing; a study of markets; possibilities of development; the production of material to fit those possibilities; and the easy acquisition of that product by the consumer at the lowest price consistent with sustained, reasonable profits. The manufacturer should definitely classify and perhaps even brand building materials for the benefit and protection of the user, grade to fit common and technical uses, and cut to fit ultimate uses according to plans. Salesmen will assist consumers with information, plans and instructions; co-operate through distributing agencies with helpful personal service, and make good all material that fails owing to mechanical imperfections, carrying honesty of purpose to the user.

Referring to what may be done in the way of selling effort Mr. Hazen points out that if every farm upon which animal food is wasted would erect a silo, the lumberman soon would require one-half of the cut of the United States for one year, and if wooden blocks were used on streets and country roads as they should be, the increased consumption of lumber would be almost beyond comprehension. In this cannection Mr. Hazen says:—

Up to the present time lumber makers have made little effort to deliver lumber in shapes, sizes and lengths ready for the ultimate user. Much lumber is cut before being put to final use, so the time shall come when cutting will be accomplished at the mill where the waste can be utilized, freight saved and deliery made in the sizes desired with economy to all concerned. Knocked-down houses, barns, garages, chicken houses, and even baby cradles are cut-up possibilities. Shelves, ironing boards, knocked-down boxes, and packages of short boards of assorted sizes for the boy carpenter will be stocked by merchants equipped to deliver such packages with other goods. Improved roads and auto truck service will revolutionize delivery from lumber yards.

The modern methods which must be practiced by manufacturers' salesmen will make demands upon distributing agencies. They will call for development along the progressive lines that some lumber retailers and many distributors of other merchandise are following. More retailers will carry ample stock, comb the field for business, and advise buyers intelligently and honestly in selecting material. They will depend upon intensified effort, large volume and reasonable profit, rather than upon mediocre effort, limited volume, high prices and speculation. There should be fewer yards, larger and better equipped, with competent selling forces. Railroads will co-operate with distributors by giving in-transit rates, under which lumber may be reshipped from central distributing points at low cost.

Speaking of the necessity for co-operation among the lumbermen Mr. Hazen continues as follows:—

The sum and substance of all these requirements is that lumber manufacturers must effect one combination in restraint of waste and another in promotion of legitimate trade. To accomplish them is not a task for one manufacturer nor for the 46,000 separately owned and operated saw mills in the United States to-day. No successful business can point to a history of achievement through the wasteful competition of so many grossly inefficient producing units.

Consider the number of such units in the lumber business to-day. Thirty-three thousand mills make less than 20 cars of lumber each per year; the annual production of each is an equivalent of less than fifty Douglas fir trees. Twelve thousand other mills make less than 200 cars each per annum; 500 Douglas fir trees would supply any of them a year. When we realize that one-half of the national supply of lumber comes from mills of these capacities with necesarily poor and limited equipment, we can better understand why unsatisfactory lumber reaches our markets, and why lumber is furnished to dissatisfied buyers.

These small units cannot accomplish the results demanded of the industry. If the greater part of our nation's needs were supplied by large, efficient units, consisting of eight to twelve plants, under highly skilled management, the problem of distribution and close utilization would be worked out in a manner helpful to all. This would not mean control of the industry by monopoly. It would simply make possible the efficiency required in handling the product at the lowest cost to consumers.

The trend is already toward larger individual mills, because it has been found that they can produce more economically; but a single mill cannot market its output scientifically. Large-scale production and twentieth-century distribution must be accomplished.

The advantages of large units to producers and consumers will be apparent, but there are vital requirements that even these units cannot meet. Some are questions for the industry as a whole to solve through associated effort, and some must be dealt with by government. Associations will deal with matters of general publicity, traffic, insurance, workmen's welfare, building code revision, conservation, irrigation, and some of those matters of research and education which are of general interest to the industry and the public.

## A Business-Aid Service for Lumbermen

The latest business-aid service instituted by the United States Government is a wood-waste exchange, enabling lumbermen and manufacturers in the various wood-using industries to utilize each other's waste to mutual advantage, aiming to effect a large saving in forest material as well as in money. The wood-waste exchange is being conducted by the forest service of the department of agriculture. More than forty manufacturers of wooden articles already have asked to be listed as having certain kinds of waste wood for sale, or as desiring to obtain their raw material in the rough or in semi-finished form from mill or factory waste. Twice a month the exchange sends out a circular headed, "Opportunities to Buy Waste," containing the names and addresses of factories having waste wood for sale, with exact information as to species, sizes, forms and quantities. Similarly, another circular headed, "Opportunities to Sell Waste," gives the specific requirements of wood-using plants which desire to buy waste material.

One of the first waste problems solved has been that of a furniture maker in Michigan who wrote to the forest service asking how to dispose of sugar maple blocks and sticks which were cut off in the process of furniture making and which he had to sell merely as fuel. Samples were obtained from him and the forest service then located a scrubbing-brush manufacturer who used small maple blocks for brush backs. The result was that the furniture maker was enabled to sell his waste at a much higher price than it had brought as firewood, while the brush maker was enabled to by brush-back material in suitable sizes at a much lower figure than it had been costing him to buy maple lumber and cut it up.

# Low Water Delaying Northern Drives

## Operators Report Difficulty in Getting Out Their Logs—Heavier Rainfall Much Needed—Very Few Drives Actually Hung Up

During the first week in May the driving conditions in most of the important logging districts of Northern Ontario and the Ottawa Valley have been unfavorable, though not seriously so. Many reports which we have received tell of low water, though in the majority of cases the operators are succeeding in getting out their timber with a little more effort and at a somewhat slower rate than would have been the case if there had been more plentiful rain, or if the winter's snowfall had been heavier. The following letters tell of the situation in many important districts:—

Editor Canada Lumberman: Ottawa, Ont., May 5th.

The lumbermen of this section are going to have an exceedingly hard time to get their drives out owing to there being so little water in the lakes and rivers, which is due to the small snow fall we had last winter and the small rain fall this spring. We have been fortunate however in getting all our drives out and have at the present time about 60,000 logs at our sawmill. We only had a drive of about thirty miles in the Coulonge River. We understand from our bush foreman that on the east bank of the Coulonge River there is a jamb of logs about a mile long which includes logs from several Ottawa and Hull firms. In the Ottawa and Gatineau Rivers I understand the same conditions prevail and if the different companies do not get their drives out there will likely be a shortage of lumber this fall.—Estate James Davidson.

Editor Canada Lumberman: Keewatin, Ont., May 3rd.

Logging operations in this district were very light during the past winter, and, although there were two or three small operators working, the larger companies—being the Rat Portage Lumber Company, and ourselves—had only one large camp each. Their logs were landed on the ice of the Lake of the Woods and will not have to be driven. Our output will be brought through a chain of small lakes and creeks for a conisderable distance before coming into the lake, and will not be delivered at the mill before July. We anticipate no more than the usual difficulty in getting this cut out, as there is plenty of water.—Keewatin Lumber Company, Limited.

Editor Canada Lumberman: Ottawa, Ont., May 5th.

I have just commenced my driving operations, the ice only having left the inland lakes last week, and so far the progress of the drives has been satisfactory; but as the present supply of water available is very much below normal, unless we have an abundance of rain from this out, I fear very much that some of our drives will be prevented from coming out to the main stream. If this should be so, the logs and pulpwood would not be available for manufacture during this season. However, I am in hopes that the present rains may continue, thereby helping out the situation.—J. R. Booth.

Editor Canada Lumberman: Snow Road, Ont., May 1st.

Water in our stream (the Mississippi) is the lowest we have ever seen it in the spring. In fact, the oldest settlers say they never saw it so low. Our drives are now out of the creeks, and we hope, with the rainfall we are now getting, to bring them to our mills. Our log cut is only about two-thirds the usual amount. We understand our nearest neighbors, on other streams, will not be able to bring their logs out at all this season, and that, in consequence, two mills in this vicinity, that have always run heretofore, will not run at all this season.—Chandler-Jones Lumber Company.

Editor Canada Lumberman: Clyde Forks, Ont., April 30th.

There is no driving of any account right in this vicinity. We understand that further down the Clyde some of the drivers are having difficulty with low water but will be able to get the logs down, as they have not many and the distance is not great.—The Clyde Forks Lumber Company.

Editor Canada Lumberman: Marmora, Ont., May 3rd.

The lumber operations in this section have been very limited and there are no fresh drives. The only driving is tailing up some work which was stranded last year in low water. The water is very low yet and will make it difficult to get them out this year. We have taken out about one-half our usual cut, but as we are in the hardwood business we deliver the logs to our mill on sleighs in winter and land them on a dry dump. Our usual cut is from 1,000,000 to 1,500,000. This year it is only 700,000.—Lynch & Ryan Lumber Company.

Editor Canada Lumberman: Sudbury, Ont., May 7th.

We expect to get through with our drives by the 10th inst., but the writer has not had as low water on the Vermillion River in the last 10 years driving. The creeks are very low, in fact, they are lower now than they usually are in the middle of June, and there is a good deal of complaining among the lumbermen in this district, that unless there is a very heavy rain fall in the near future there will be a good many logs stuck in creeks.—Haight & Dickson Lumber Company, Limited.

Editor Canada Lumberman:— Ottawa, May 11th.

This has been a season of low water, making the drives in this section very difficult. We would judge that there will be at least some sticking of logs but we think the greater share of them will come out to the main streams because recently there has been more or less heavy rain to help the conditions, and if there should be a continuance of fairly showery weather, we think the drives will be generally successful, but no doubt expensive.—W. C. Edwards & Company, Limited.

Editor Canada Lumberman: Toronto, Ont., May 1st.

The future of the drives depends entirely upon the matter of rain, and is, therefore, uncertain. Unless we get some heavy rains, some drives are bound to be hung up. It has been an unusually dry spring and, on the law of averages, we expect, before the season closes, we should have plenty of water. We are concerned about the situation, but do not consider it has reached the stage yet where it is desperate.—Graves, Bigwood & Company.

Editor Canada Lumberman: Midland, Ont., May 1st.

Our logs are coming out from Blind River this season, and although we have two creeks to drive they are short and we do not anticipate any difficulty in getting our logs into the main river. Generally speaking, however, we do understand that the water is very much lower than it has been for years and unless we get considerable rain some of those having small streams to drive will doubtless have trouble in getting their logs out.—Chew Bros.

Editor Canada Lumberman: Ottawa, Ont., May 3rd.

So far as we know, the drives have not started yet, and so far as our own logs are concerned, they are all dumped on the big lake, and it is only a matter of towing, but we understand that parties who have creeks to drive are not anticipating any trouble, as the swamps are full of water, and they figure on having enough water to drive the small streams.—Shepard & Morse Lumber Company.

Editor Canada Lumberman: Toronto, Ont., May 3rd.

Our logs are on the Seguin and Muskoka waters and we have plenty of water to get out with, although we have been bothered in getting out of one creek a little on account of water being scarce. No doubt the northern drive, especially where they have to get out of creeks, will suffer terribly on account of lack of water, and we are afraid some of the drives will be hung up, as the snow went away so early in the winter.—Fesserton Timber Company, Limited.

Editor Canada Lumberman: Chapleau, Ont., May 5th.

So far as we are personally concerned we do not anticipate any difficulty with our drives as we have very large lakes for reserve, but the general conditions could not be much worse for driving operations in the whole north country, and it would seem to us that unless very heavy rains come in a short time, there are going to be a number of drives tied up.—Austin & Nicholson.

Editor Canada Lumberman: Pembroke, Ont., May 3rd.

We find water on the Upper Petawawa very low, in fact so low at one or two points that it is impossible for us to move our logs at present. Of course, should we get rains in sufficient quantity to raise the water a few feet, we will get everything out, otherwise we will have to leave part of our cut.—Petawawa Lumber Company, Limited.

Editor Canada Lumberman: Marmora, Ont., May 1st.

So far as we are aware there are very few firms who got out any logs in this section of the country during the past winter, and conse-

quently there will be no drives to speak of. The water has been very low this spring and there has been nothing like the usual freshets. Unless we get heavy and frequent rains during the next couple of months it is likely that the rivers will be very low ineded.—The Pearce Company, Limited.

---

Editor Canada Lumberman: Biscotasing, Ont., May 6th.

We find this one of the dryest seasons we have had in our experience, and unless we have considerable rain during this month, driving will be interfered with in a great extent. We have only a short drive here ourselves this year and expect, with the assistance of some rain, that we will have no difficulty in getting it out.—P. & J. Shannon.

---

Editor Canada Lumberman: Pembroke, Ont., May 3rd.

It is almost impossible to say at present what success we will have with the driving of our logs this spring. We have just commenced on this work and, unless we get heavy rains to raise the water, we fear there will be great dfficulty taking out drives at one or two of our branches.—The Colonial Lumber Company, Limited.

---

Editor Canada Lumberman: Midland, Ont., April 30th.

The water, generally speaking, is very low this spring, much lower than it has been for many years. The logs that I am driving, I fully expect will have plenty of water, and up to the present time, have not heard of any that will not get out, but I fear that some, who are working on small streams with not much behind them, will be in danger.—Manley Chew.

---

Editor Canada Lumberman: Port Arthur, Ont., May 4th.

Present indications are not favorable for driving, as the water in all the rivers and lakes is lower than it has been for several years, and unless we get heavy rains we expect lumbermen in general to experience some difficulty in getting out their drives.—The Pigeon River Lumber Company.

---

Editor Canada Lumberman: Gravenhurst, Ont., May 3rd.

The only drives we have this year are on the South Branch of the Muskoka River and on the Black River. In both these places we have plenty of water in reserve and both drives are coming fast and likely to be in, one month earlier than usual.—Mickle, Dyment & Son.

---

Editor Canada Lumberman: Sarnia, Ont., April 30th.

We are not in touch this year with log driving as our entire output this year comes into Sarnia by rail. The other logs, which we have coming in, are already out to the mouths of the rivers.—Cleveland Sarnia Saw Mills Company.

---

Editor Canada Lumberman: Bracebridge, Ont., May 1st.

The drives in this district are all under way now and as there is lots of water the logs should reach the mills within the next two or three weeks.—J. D. Shier Lumber Company, Limited.

---

Editor Canada Lumberman: Whitney, Ont., May 4th.

There are no important drives in this vicinity. Water is unusually low, but no drives near here will be hung up on that account.—Dennis Canadian Company.

---

Editor Canada Lumberman: Huntsville, Ont., May 1st.

There are very few drives around here this season, and we understand that they are coming out, but progress is very slow.—Huntsville Lumber Company, Limited.

---

Editor Canada Lumberman: Magnetawan, Ont., May 5th.

The drives here are all safe. I had over 3,000 pieces last year stuck, but have all out now. The drives were considerably lighter than last year.—Wm. McLachlan.

---

Editor Canada Lumberman: Bracebridge, Ont., May 1st.

So far as I know, the drives in this locality will come out alright. There are not any large drives and the water seems to be plentiful.—Geo. Tennant.

---

Editor Canada Lumberman: Campbell's Bay, Que., May 5th.

We think it will be very difficult for lumbermen in this vicinity to get their logs out, as we have never known the water to be so low before.—Smith Bros.

---

Editor Canada Lumberman: Owen Sound, Ont., April 30th.

Our drives are short and new logs are now coming out, though water is lower than usual at this season.—John Harrison & Sons Company, Limited.

Editor Canada Lumberman:— Montreal, May 11th.

Our drives are coming out very well. The water in our stream has been very good and the drives up to the present time have made very good progress. We will get all our logs out and expect to complete our drives down to the main boom two weeks earlier than usual.—The Riordon Pulp & Paper Company, Limited.

---

Editor Canada Lumberman: Pembroke, Ont., May 3rd.

At the present all our drives are coming along fairly well, and we do not expect to stick any logs this season.—The Pembroke Lumber Company.

---

Editor Canada Lumberman: Burks Falls, Ont., May 5th.

Our own drives are all exceedingly short, and we expect we shall get all out early and in good shape.—Knight Brothers Company, Limited.

---

Mr. J. A. Detweiler, of the Quincy Adams Lumber Company, Limited, Toronto, in an interview stated to the Canada Lumberman that his company's drive this year has come out safely.

---

The Collins Inlet Lumber Company, Toronto, have not been troubled with any shortage of water in their drives this year.

---

While the water supply is considerably below normal for this season of the year, yet, so far as I can hear the drives are still moving. There may be a few of the smaller creeks that are doubtful at the present time, but if we should get the precipitation that is due us after the remarkably dry season, and get it within the next ten days, everything may come. I have not heard that anyone had as yet finally abandoned any drive. Ten days or two weeks from now we will know more about it.—North Shore.

---

## Driving Reports from Eastern Canada

A heavy rain fall took place in New Brunswick during the first week of May, which resulted in many of the streams in the central portion of the province overflowing their banks and causing considerable damage to highways, railway tracks, etc. A further result was that large quantities of logs were brought out of the woods with an unexpected rush. The St. John River at Fredericton on May 3rd was nearly 13 feet above the summer level and fully 18 inches higher than at any former time during the present spring. In the northern parts of the province there was at the same time a fall of snow, so that the run off of water into the rivers was not so rapid, which probably prevented serious damage in the south of the province.

Frasers' Limited, drive on the Rusiagornish River had too much water, the stream having swollen to such an extent that the logs were carried over the intervals. Some of the Fraser's drives on the Temiscouata were already out by May 2nd, the earliest date on record. Reports from Tobique were that the two drives on the branches of the Sisson stream were out at the same time.

The River Valley Lumber Company's drives for their mill at Oromocto were out by May 5th.

---

A well-known Ontario lumberman who has recently spent much of his time in the manufacturing districts of the Maritime Provinces, Quebec and Ontario, reports that generally speaking there was, up to the first week in May, a shortage of water for driving purposes throughout Ontario and the East. In Cape Breton, he says, many of the firms have had their logs left in the woods because of the small quantity of snow that fell last winter and because of the early spring. In Northern Ontario, he reports, there was comparatively little snow and it melted early. Unless we have a generally good fall of rain this spring some firms, he believes, will have a shortage of logs.

---

The River Valley Lumber Company's drive at Little River, N.B., amounting to about 2,000,000 feet has been safely rafted and at latest accounts was well on its way to the company's mill at Oromocto. The company's drive on the north branch of the Oromocto was also making good progress at latest accounts. This drive contains about 2,500,000 feet. It is not expected that the drive on the Rockwell will be brought out this spring as the water dropped very rapidly at an early date.

---

The W. J. Noble drive of about 8,000,000 feet for Stetson, Cutler & Company, St. John, N.B., was reported early in May to have passed Seven Islands and to be making excellent progress. It was expected to be one of the first drives from the Upper St. John River to reach the corporation limits.

---

At the beginning of the second week of May, reports from many points in New Brunswick indicated that the driving conditions were improving. Heavy rainfalls occurred in nearly all parts of the province, making the driving conditions much more satisfactory.

# Electricity in the Lumber Industry

## An Account of the Rapid Development of Electric Drive for Logging and Manufacturing Operations—Typical Installations Described

By E. F. Whitney*

The material for a planing mill has usually been subjected to a drying process—either natural or artificial. All of the machines are designed for constant-speed drive, the variations in rate of speed being accomplished by changing the sizes of the feed roll driving pulleys.

Power demands of planing machines have increased somewhat in the last few years, due to the development of fast-feed planers. This increase, however, has not been accompanied by a corresponding increase in motor sizes, as the present tendency is to utilize more fully the rated capacity under usual conditions, operating the motor at overloads when handling the heavier stock. It is universal practice to connect constant-speed, squirrel cage motors directly to the machine driving shaft, using a flexible coupling. Profile attachments are more conveniently operated by an individual motor driving the two profile cutting heads.

The starting duty of planers is rather severe, due to the large masses to be accelerated to high speeds. To this is traceable the common fault of "over-motoring" which was so much in evidence with the older, medium-feed machines. The advent of welded end-ring rotor construction has removed this obstacle.

The running load is fluctuating according to the small irregularities in the dimensions of rough stock. Friction load is approximately 55 to 60 per cent. of the working load. The working load factor of a planer seldom exceeds 60 per cent. of its maximum capacity, since some time is lost in locating rough stock for the operator, and in changing from one size stock to a different size. Standard profile attachments run at constant speed and require 15 h.p. The starting duty is light and the running load fairly steady.

### Combination Matcher and Re-Saw

On orders which will permit one side rough, the re-saw simply splits the stock after it has been properly surfaced. The power requirements of the matcher end do not vary from standard machines. The re-saw (diameter of wheel 54 ins. or 1.37 m.—saw blade 7 ins. or 18 cm.) requires 35 h.p. to drive it. The motor is mounted on top of the re-saw frame and its weight is supported by a counterweight from a sheave attached to the ceiling. The best method of drive for a re-saw so mounted is by a silent chain. The matcher end requiers a 50 h.p. motor.

In isolated instances, fast-feed matchers have been fitted with individual motors for driving the various elements of the machine, i.e.—one motor driving the feed rolls and one for each cylinder or knife drum, etc. A modern fast-feed planer, size 6-in. by 15-in., feeding 200 to 250 ft. per minute, requires motors as follows: top cylinder geared with cloth pinions to a 35 h.p. motor, bottom cylinder to a 20 h.p. motor, side heads to 15 h.p. motors, feed rolls to 15 h.p. motor.

Such refinements have shown an actual saving in energy over the one-motor method, since all belt friction and slippage is eliminated. The high speeds required for the various parts of the machine, some of which do not fit standard speeds of a 60-cycle motor, made it necessary to resort to gearing with cloth pinions. Very satisfactory results have been obtained.

After being finished, the product from the planers is trimmed to remove defective portions; it is then sorted and bundled. Old practice required a trimmer table with a swing cut-off saw for each machine, the output being handled by hand after leaving the machine. Their work is very intermittent and the starting load is light. Squirrel cage, constant speed motors are used, the usual size being three h.p. Tests of a 20-in. saw follow:

| | |
|---|---|
| Running light | 1.2 kw. input |
| Cutting one 2 x 4 in. | 3.8 kw. input |
| Cutting two 2 x 4 in. | 4.8 kw. input |
| Cutting three 2 x 4 in. | 7 kw. input |
| Cutting one 2 x 6 in. | 5.1 kw. input |
| Cutting one 2 x 12 in. | 6.2 kw. input |
| Cutting one 1 x 6 in. | 2.7 kw. input |
| Approx. load factor | 30 per cent. |
| Demand factor | 300 per cent. |

The duration of a cut is very short, otherwise the size motor ordinarily employed would have to be materially increased.

The advent of fast-feed planers and matchers necessitates a greater capacity method of handling the output without entailing a too great labor addition. The scheme adopted is to group all planers so that their output falls upon a transfer table. At the end of this table is installed an automatic trimmer similar to but smaller than the saw mill trimmer. In this way one man can trim the entire output. A squirrel cage constant-speed motor furnishes a satisfactory drive, 25 h.p. being the average size motor adopted for this service.

The transfer tables and refuse conveyers in a planing mill are usually operated by back-geared wound-rotor motors with chain drive. The material to be handled is very light, requiring at maximum three to five h.p. motors for such service.

Besides the trimmings, the other refuse from the planing mill consists of dust from the saws and shavings from the planers. The sawdust and shavings are cared for by air suction and blower systems. Usually the trimmings are put through a small capacity hog and then handled by the same blower system, or conveyed to a wood bin for the local wood market.

### Refuse Exhaust System

Ordinary centrifugal fans capable of giving 5 oz. pressure are commonly used. Motors are sometimes direct-connected to the fan impellers, but more often belted, since with the latter arrangement the speed of the fan can be changed from time to time to get the correct pressure required in the system. With direct-connected fans, the impellers are ordinarily pressed directly on the motor shaft extensions, the motor bearings caring for the slight additional weight of the fan impeller. Fig. 21 shows such an arrangement. Constant-speed motors are used for this service. The load is practically constant throughout the operation, and is slightly less when the planers are working than when idle, provided of course that the suction intakes are left open at all times. Double fans are ordinarily used, one side lifting the refuse and the other side blowing through the pipe line to the fuel bin.

It is common practice to install a simple low-pressure gate in the suction to each machine, so that that particular intake may be isolated when the machine is shut down, thus reducing the energy required.

The following is indicative of the average power requirements of

* Reproduced by courtesy of the American Institute of Electrical Engineers—concluded from May 1st Canada Lumberman.

Fig. 21—Double 60-in. Exhaust Fan Direct-Connected to Motor.

Fig. 22—Interior of Shingle Mill using Electric Drive. The Compact Machines and Absence of Transmission Belting is in Marked Contrast to the Crowded Appearance of Belt-Driven Mills.

fans under usual conditions, length of pipe line, intake openings, etc., being assumed normal:

| | |
|---|---|
| Single 40-in. fans | 20 h.p. |
| Single 50-in. fans | 25 h.p. |
| Single 60-in. fans | 35 h.p. |
| Single 70-in. fans | 50 h.p. |
| Double 40-in. fans | 35 h.p. |
| Double 50-in. fans | 50 h.p. |
| Double 60-in. fans | 75 h.p. |
| Double 70-in. fans | 100 h.p. |

Another system which has proved economical in energy consumption makes use of a low-pressure centrifugal fan for suction only, and uses high pressure for blowing the dust through the pipe line to the fuel bin. With centrifugal fans used for both suction and blowing, all of the material handled is passed through the impeller itself, necessitating large clearances and a consequent loss in efficiency. With the high-pressure system, none of the dust or chips passes through the fan itself, but the discharge from the collector empties into a revolving drum with vertical cylindrical compartments. The cylindrical cartridges thus formed are forced through the pipe line as each compartment revolves under the compressor discharge. Centrifugal compressors and positive pressure blowers find a wide field in the high-pressure system.

### Shingle Mills

Figs. 23 and 24 show the latest tendency in the layout of shingle mills. The logs are handled in the same way as in a saw mill, after which they are cut into bolts, which go to the shingle machines and are finally trimmed, sorted, bundled and dried. Fig. 24 gives the main floor plan of an electrically driven mill, while Fig. 23 shows the elevation of a later mill. The latter was orginally planned for steam drive, but later changed to electric, so that the elevation shows a line shaft in error. In the final plans, this was eliminated and the driving motors connected to the shingle machines, as in Fig. 24. Fig. 22 shows the shingle machine floor of this mill, which is the first, of which we have record, using individual motor drive throughout. Its operation has been very satisfactory. Of all the machines used in these operations, only the shingle machines, shown in Fig 22, differ from those already described for other operations.

The standard upright shingle machine requires two motors for its best operation—a 20 h.p. motor driving the main saw and mechanism and a 3 h.p. motor driving the trimmer saw—both constant-speed, squirrel cage motors direct-connected to the driving shafts. The power requirements of the complete machine—both the shingle saw and the trim saw—are about 18 kw. input, no-load, and 20 to 21 kw. input when cutting.

### General

In general it is estimated, in a mill using steam engines with line shaft drive, that 8 to 10 h.p. per M. feet b.m. capacity per 10-hour day, is required for the sawmill machinery only. This old rule-of-thumb method was close enough for practical purposes, since with maintained steam pressure the engines had large overload capacities, but with very poor speed regulation. This poor speed regulation is noticeable in nearly all steam-driven mills. The friction load is enormous, requiring often 40 per cent. of the rated engine power when running the mill idle.

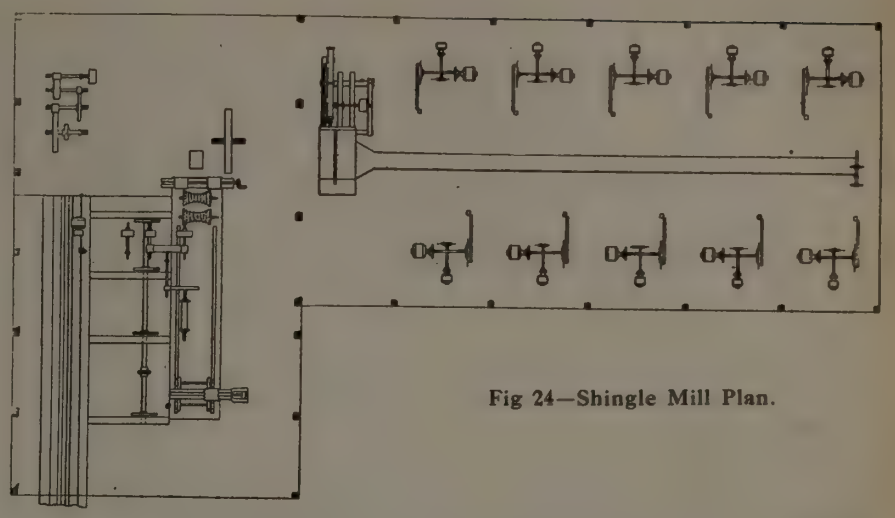

Fig 24—Shingle Mill Plan.

With the advent of electric drive, the motor horse-power installed will approximate 11 to 13 h.p. per M. feet b.m. capacity per day, for both sawmill and planing mill.

The energy required for manufacturing 1,000 ft. b.m., including planing mill operation, has been found to vary from about 29 kw.hr. in the white pine district to 46 kw.hr. in the fir district of the Pacific Coast, which would indicate an actual electrical horse-power of from 3.8 to approximately 6 h.p. per M. feet daily capacity of an electrically operated mill.

The cost of power to the average saw mill operator means very little, due to the large wastes which they must experience in their manufacturing operations. Those mills, located remote from any available market, must dispose of this waste either by generating power for their own use or consuming it in refuse burners.

### Refuse—Uses and Fuel Value

The question of refuse disposition is one of the large items of expense in connection with the average mill. Adding the refuse from the planing mill and other manufacturing departments, the total loss may easily reach 40 per cent. of the original scale of the log. Of course the greater refinements in using the by-product will reduce the proportionate amount of refuse.

Except for fuel, the uses for this have been very narrow. At-

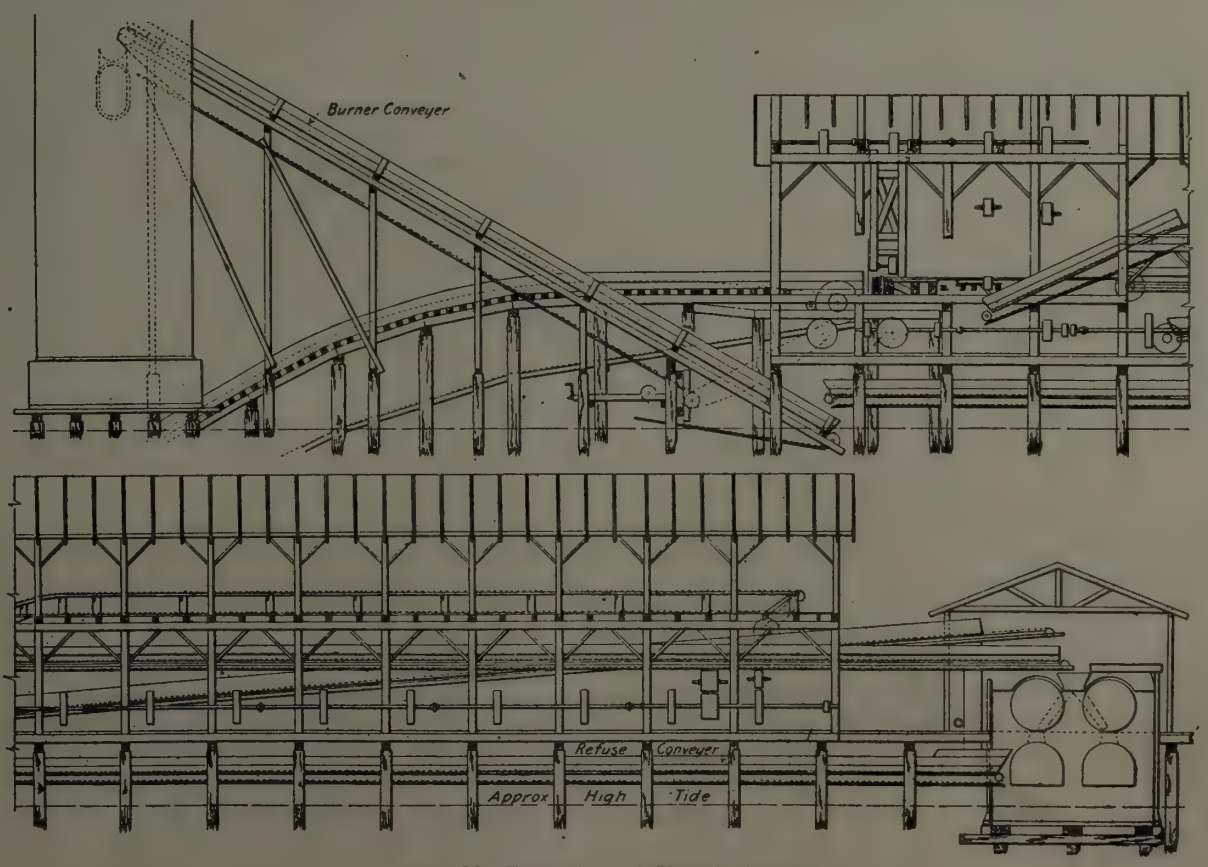

Fig. 23—Elevation of Shingle Mill.

tempts have been made to use sawdust from Pacific Coast mills, which cut mostly fir, spruce and hemlock, for manufacturing wood alcohol and ethyl alcohol. In practice, however, the manufacturing costs run so high that it has proved unprofitable. The latest projected use is in making sawdust briquets to be used for paving purposes, and also for use as fuel. Such a plant has been completed, although its operations have not extended over a sufficient period to determine the ultimate success.

As fuel, the refuse values, wherever there is an available market, are shown by the following data:

| | |
|---|---|
| Wt. one cu. ft. wet sawdust | 21 lbs. |
| Per cent. moisture | 48 to 52 per cent. |
| Heat value per lb. wet sawdust | 3,500 B. t. u. |

Wet sawdust means that in its natural state coming directly from the mill operations, and includes cut fuel from the hog. The dust from planing mill operation is relatively dry, and as fuel, has a value per pound of 8,500 B.t.u. These values are averages of a number of analyses and apply to sawdust from mills cutting mostly fir and spruce. As ordinarily found in the fuel bin, the mixture has some intermediate heating value. Sawdust is usually sold in units of 200 cu. ft., the equivalent of about 0.88 cord of slabwood.

Slabwood is cut to 4-ft. lengths and sold by the cord. It also has a wide use as fuel, though as such it is more expensive than sawdust.

The following table gives the average values of wood fuel as compared with oil and coal, the costs of the various fuels per unit being assumed as in column five. Column two gives evaporation values taken from tests at the same plants, using the fuels named.

| | B. t. u. per lb. dry fuel | Lb. water evaporated from and at 212 deg. per unit. | | Cost per 1000 lb. water from and at 212 deg. | Cost per unit of fuel |
|---|---|---|---|---|---|
| Sawdust | 8,500 | (200 cu ft.) | 10,500 | 9.5 cents | $1.00, 200 cu. ft. |
| Slabwood | | (1 cord) | 12,500 | 24 cents | $3.00, 1 cord |
| Split cord wood | | (1 cord) | 13,500 | 37 cents | $5.00, 1 cord |
| Oil | 18,500 | (1 lb.) | 15 | 21.9 cents | 1.10 per bbl. |
| Coal | 11,000 | (1 lb.) | 7.2 | 41.6 cents | 6.00 per ton |

## Meeting the Consumers' Needs

By W. W. Brown

I think you will all agree with me that the tendency these days is for the manufacturer to take his lumber direct to the consumer whereever it is both economical and practical. This is true not only with the lumber but with many another business, and where it is economical and practical, is bound to produce good results, providing the two parties can get together on a standard basis and deal honestly and intelligently with each other.

In order to accomplish this, each must know something of the other fellow's business. The lumberman must know the needs of the different manufacturers in order that he may cut his lumber to suit the market. The manufacturer should know something about the lumber business to be able to deal intelligently with the proposition, because it is not only a lumber proposition up to the time the manufacturer receives it, but it is a lumber proposition with the manufacturer on through his dry kilns, cutting department, planing department and gluing department up to the time the various parts are ready to be assembled into the manufactured article, and then after it gets to the finishing room, it is more or less a lumber proposition in the way the different kinds of wood take the finish and the difference in the texture of the same kind of wood in taking the finish.

For example: take a car of quartered white oak that is composed of lumber sawed from logs gathered together from different sections of the country—some cut from high land where the trees are more exposed and become hard and tough, and some from the denser timber of the low-lands where it grows larger and is of a softer quality; cut it up into the right dimension—say in a lot of fifty cabinets, and according to our experience the cabinet maker will be able to produce only twenty-five to thirty cabinets out of fifty that are matched up for color and that will finish evenly. The other twenty to twenty-five cabinets, having from twelve to twenty drawer fronts, will look like Joseph's coat of many colors no matter how careful the finisher may be, because of the different texture and hardness of the lumber.

We have found that by buying quartered oak from one tract of timber where there isn't any blue wagon makers' or highland oak mixed in, we reduce the number of cheap cabinets from twenty to twenty-five out of fifty to five or six out of fifty. The same trouble was experienced in mahogany. This trouble is done away with, however, by buying from a company that gets its logs direct out of one district or tract of timber; instead of from companies that have an assortment of logs derived from several districts along the African coast.

The manipulation of grades, except where there is an agreement or understanding between the lumberman and manufacturer, has caused considerable trouble and is a practice which I think ought to be eliminated. Neither side is wholly to blame. The manufacturer on the one hand, who insists on a cheap grade and won't pay the market value for the full product of the grade he wants, is much to blame, for the lumberman in order to sell him lumber must manipulate a grade for that particular price and give the fellow a cheap grade in quality as well as in price. In the end the manufacturer will find that he has been paying a good price for what he is getting, especially if the lumberman is a little unscrupulous and carries his manipulation to such an extent that it more than offsets the difference in price. On the other hand, there are lumbermen who seem to be looking for the fellow who doesn't understand lumber and is an easy prey to manipulation whether or not he pays the full market price for the lumber.

Most of the progressive lumbermen to-day express a desire to sell their lumber on a straight grade basis and demand a fair price, and it seems to me that this is the only way. The manufacturer would be ahead in dealing this way and he can and ought to help in many different ways. First, by learning something about the lumber that he can test the different grades in his factory and determine what is the most economical for his use. Then he knows exactly what he wants and can give this information to the lumberman that he in turn may manufacture his lumber to suit that trade. Some manufacturers think they are giving away cherished secrets to take the lumberman into their confidence and tell him how they cut up the timber and what use is made of it. It strikes me that that is rather a foolish attitude to take, for the more a lumberman knows about how the lumber is cut up and what it is used for, the better can he serve the interests of the manufacturer.

To know which grade or combination of grades in the different kinds and thicknesses of lumber we should buy in our plant at Two Rivers, we conducted a few tests, by testing one grade against another or against a combination of grades. The first was in the 4/4 birch, which is cut into lengths from 11 in. to 4 ft., used in the manufacture of printers' goods. In this stock we tested No. 1 common, No. 2 common, and No. 3 to find out the most economical grade to use. We made several tests of each grade and the result was that the clear product derived from the No. 1 common, figuring it at $26.00 per thousand, cost about $31.00 per thousand, figuring the waste and labor in cutting and handling. The No. 2 common, figuring the lumber at $18.00 per thousand, cost about $24.50, and the No. 3 common at $16.00 per thousand cost $32.00. You can see by these tests that the 4/4 No. 2 birch works up at a saving of $6.50 per thousand over the No. 1 common and $7.50 per thousand over the good No. 3 common. These tests prove that where the No. 2 grade is graded on a clear cutting basis and your cuttings are from one foot to four feet, that it is the most economical grade to use.

The next test was in 5/4 basswood. This stock we cut up into cuts from 4 ft. to 8 ft. lengths for engraving boards and print boards. These must be clear white, both faces, not even a brown or black streak the size of a lead pencil being allowed, and they must be free from all crossing marks. We have been buying 5/4 winter sawed basswood firsts and seconds, but most of it was sawed in the summer, and were getting the No. 1 and better the full product of the grades both brown and white in color, paying a good price for a first and second grade. Some lumberman had tried to make us believe that if basswood were sawn in the winter it was white. The consequence was that only about one-half of the product worked into the article for which it was intended and one-half of the stock had to be used where a good No. 2 and 3 grade was good enough. The loss in working off the half of the 5/4 was about $20.00 per thousand. That is quite an item where you use from 100,000 to 150,000. We now buy a No. 1, common and better grade of white basswood and make a saving of several dollars per thousand, although we have to pay a little more, and buy a No. 2 and No. 3 common grade to take the place of what was culled out of the No. 1 and better mixed colored stock. The same was true with the 6/4 basswood, only we used up the waste from that at a much less loss.

In the 5/4 white maple the test was similar to that of 5/4 basswood, but the loss was not so great, effecting about a $10 loss on about one-half of from 100,000, 125,000 per year.

These are only a few of the many instances already tested out. In fact, we have only begun to get at the bottom of the matter. I have a number of other tests which I am now working on and expect to get equally as good results as in some of the tests mentioned.

The economic use of lumber is a study that every consumer ought to take up, for it not only means a saving in dollars in the cost of his material for the present year, but will help to prolong the timber cut of the country, thereby keeping prices within a reasonable limit for years to come. There is considerable work being done in conserving the timber of the forests and it is right there should be, for if there is any natural resource in this country that has been abused asd wasted, it is timber. But what is the use of conserving the timber if the product of that timber is mis-used and wasted after it is cut into lumber. The manufacturer and consumer cannot afford to go on like this indefinitely, spoiling lumber by mis-manufacturing and caring for it, using

lumber that doesn't suit his purpose, and peddling a large share of it around town for firewood. The manufacturer can no more afford to waste the lumber than the sawmill man can afford to waste his timber without expecting the price of lumber to advance needlessly and the cost of production to go beyond reasonable bounds.

Both the lumberman and manufacturer are to blame for this needless waste—the lumberman for not specializing enough in the manufacture of lumber, oftentimes to poorly manufacture and care of it and in a great many cases to sell his lumber in the wrong market or to a consumer whose needs do not suit. The consumer, on the other hand, is to blame for not buying the right kind or quality that is the most economical and suited to his purpose—sometimes through ignorance, sometimes through carelessness or oversight.

From what experience I have had in lumber, it seems to me that if the lumbermen would specialize more in the manufacture of their goods, they would realize much more out of their product and find a more ready market. From this I mean, not to try to cater to all the trade by cutting up one kind of lumber into a dozen different thicknesses and that many grades, thereby spreading their stock out so thin that there is nothing left to any of the grades, especially the thinner stock; where the larger and better logs have been cut into thick stock. With the ordinary mill, where they have only 2,000,000 to 5,000,000 of hardwood lumber all told, it is impossible to cut all thicknesses of lumber and satisfy the different consumers' wants properly. If you have a good run of birch, for example, and you want to sell to the finish trade that takes a No. 1 and better unselected grade, saw your birch all 1-in., and with careful sorting your lower grades will be up to standard and give satisfaction.

I had some experience along that line when I was shipping lumber. One place my people had about two million feet of birch lumber cut from 1-in. to 2-in.; the better logs cut into thick stock No. 1 and better. In shipping the 5/4, 6/4 and 8/4 we experienced no difficulty in satisfying our customers. When we shipped the 4/4 we sorted out the 1 and 2 red and the No. 1 red, which went through fairly well, although there was complaint that it was not wide enough. Sawing the thick stock was to blame for that. Then we sorted the 1 and 2 plain, together with the one-face 1 and 2 plain, out of the No. 1 and 2 common grades to ship west for finish lumber; the 1 and 2 face 4-in. strips for flooring and moulding trade. And what was left of the No. 1 common and No. 2 common we sold and started shipping, but the first cars hadn't any more than reached destination before I got word not to ship any more of the No. 1 and 2 common birch. Somebody bought that birch who knew lumber and knew that it was robbed, and I don't blame him for kicking because it was not only skimmed on top by the choice No. 1 and No. 2 common getting into the thick stock, but it was skimmed on the bottom by sorting out the red common and choice red 2's;; on one side by taking out the finish, and on the other side by taking out all the good strips. And a grade skimmed on four sides is mighty poor stuff and can't very well satisfy the easiest kind of a customer. Now had that stock been sawn into 1-in. and 1¼-in. or 1½-in., or even a small amount of 2-in., being careful not to saw all the best logs into thick stock; throwing part of them into 1-in., and shipped straight without sorting out the red, strips and finish, there would have been no complaint.

Last spring I was in the market for some 4/4 No. 2 and better maple. One company quoted me a price so low that it looked like a bargain. I went to look the stock over to see what it was like and I found about 200,000 of 4/4 maple, sawed all the way from ¾-in. to 1¼-in. thick, poorly edged and trimmed, nothing over 8 ins. wide and all lengths piled together on 10-foot foundations, thus allowing the 16-foot to project about 6 feet to the weather. The crossings were so badly out of line with each other that there was scarcely a straight course in a pile. The foundation timbers were laid on an old fill without putting any new slabs or hog-feed under them; consequently they settled unevenly and the lumber became twisted. They had in the first place about a half million feet of good maple, sold all the veneer logs, cut all the No. 1 and better thick stock they could, and the 4/4 that was left was jacket boards and lumber from small logs. There was a fairly good grade of narrow No. 1 and No. 2 common in the stock at that, with perhaps a sprinkling of five per cent. of seconds, and would have been good lumber for a flooring mill had it not been almost entirely spoiled in sawing and by poor care. No manufacturer could afford to take that stock at $10 per thousand unless he was going to cut it into very small cuts. Where lumber is mis-sawed, crooked, twisted, weather-beaten and checked on the ends, it is impossible to get any sized cuttings without an enormous loss.

In the manufacture of lumber the first thing to be considered by the sawmill man is the size, quantity and quality of his logs and if he has a large enough amount of any one kind and they run good to quality and size, by careful engineering he can cut from two to three different thicknesses without needlessly robbing any one thickness.

The second consideration is the sawing and manufacturing. Care should be taken that the stock is full thickness when dry and is properly edged and trimmed.

The third and very important consideration is the proper piling and care of the lumber. A grade of No. 2 common well taken care of is of more economic value to a manufacturer than a No. 1 common grade that has been poorly piled and is stained and warped out of shape.

By careful study in regard to specifications for lumber, I find that very good results can be obtained by using the grading rules compiled by the various lumber associations. One can almost always find some grade or combination of grades that will meet every requirement. There are cases where a special length and width works up to better advantage but we must also keep in mind the fact that it costs more money and oftentimes the difference doesn't offset the extra cost.

In dealing with the lumber proposition along these lines, the manufacturer can greatly assist the millman by not forcing him to cut any more special stock than is absolutely necessary, and having left a large amount of stock on his hands that has been robbed and is hard to get rid of.

---

## Right and Wrong Methods of Feeding Sanders

The methods of keeping Endless Bed Sanders, or any other large capacity sanders full of stock have not received much attention. You know that these machines are capable of doing a great deal, but they don't always do it. Now the question is, where is the fault—with machine or operator? My experience is that there's nothing to blame the machine for. Some operators can get the full capacity from their sander while others can't, and it is largely a matter of the right method of feeding stock, and not because the work is too much for one man, at all.

On the big capacity sanders there is quite a trick in keeping up to the full speed of the machine in feeding stock or in removing it. About the most common fault is that of having the truck too far away. I have seen operators with their truck, on short stock, standing four or five feet away; and the same with the fellow at the back end. When the stock is placed as near the machine as convenient, and not way to one side, the operator has about one-third the trouble keeping up as under the reverse conditions. The shorter the stock, the more time required to handle it, and therefore the greater the loss when it is not placed as effectually as possible.

So much for the location of your stock. Now there are about three general ways of feeding small stock.

The worst of these ways is fortunately not seen so much now that the large capacity machines compel the operator's attention. Still some operators have a notion that they can do satisfactory work and look around and talk most of the time while feeding stock. They will pick up a handful of short stock, carefully pile it up on the infeeding table and then gingerly lay about three narrow pieces across the bed of the machine. As their attention is not fixed, stock is separated about eight inches and not half the machine's capacity is used.

Another class of operators mean well and work hard, but still they have not quite the right knack of feeding stock. They will pick up six or seven pieces of stock, just enough to fill the width of the bed, pile them on the infeeding table and will then separately place each piece, beginning at the fair end of the Sander and advancing across the bed keeping stock as near together as possible. Those men think they are keeping their machines as busy as can be, but as a matter of fact they loose at least one-third of the output they could get without any harder work on their part. They never have thought out a possibiy better way to handle their jobs.

The best way is to place the truck at your side near one corner of the feeding bed. Stock should be carefully piled on the truck, then when you pick it up, take both hands, taking from two piles in the truck at once. Now distribute the pieces across the sander bed, dropping two pieces at once from the bottom of the two small piles in your hands. This applies, whether you are hopper feeding or not, because with hopper feeding, you simply keep on replenishing the piles, across the sander's width. This is not hard work, in fact it is easy, and it is made easier the more conveniently the truck is placed.

That applies to narrow and short stock. Where long or wide stock is to be sanded, I prefer to feed two pieces at a time. I first feed the two on the right, then two on the left and keep alternating, and the sander is full of stock all the time.

It is all a matter of trying to find the easiest way, and as I am naturally lazy the easiest way was not hard for me to find.

Just about these same methods apply in the matter of removing the stock. Some men will pick up one piece at a time, and always have a hard time keeping up, while others who know, will wait till the outfeeding table is full of stock, and then with one motion of both hands pile the stock on the whole width of the sander into two piles and stack it on the truck, which is close at hand, and wait for the next swoop. They even have time to rest, and still do more work. So the more efficient the operator, the easier it is to keep the outfeeding table clear.

Generally speaking, I find that the only reason sanders do not live up to their advertised capacity is that the operator through inefficient feeding methods is not keeping up to his true capacity or that of his machine.—Berlin Quality.

# Orillia's Fine New Woodworking Plant

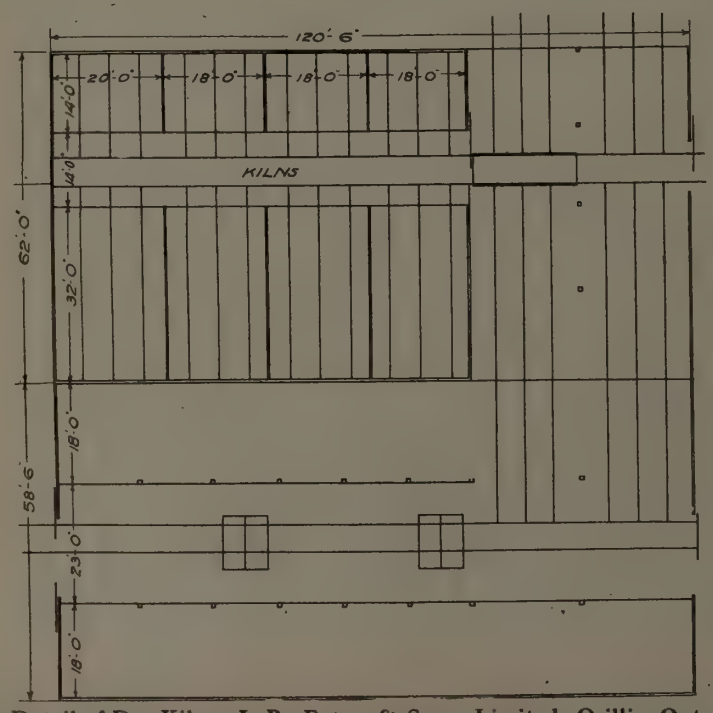
## Description of the Equipment and Layout of J. R. Eaton & Sons' Interesting Plant—Excellent Facilities for Milling in Transit

One of the examples of enterprise among woodworking institutions, which are noticeably more numerous just now in this industry than in many others, is that of J. R. Eaton & Sons, Limited, Orillia, Ont., manufacturers of general mill work, including hardwood flooring, exterior and interior finish. The company recently completed a modern and up-to-date factory building which will be one of the finest woodworking plants of its kind in Ontario.

The present head of the company, Mr. J. R. Eaton, is a native of Ireland, and was brought to this country when a child. His boyhood was spent at farming in Ontario. He moved to Detroit where he learned his trade and business and returning to Canada 32 years ago he located at Orillia and engaged in business as a building contractor. He carried out important contracts in the north country and, to supply his own requirements, operated a small planing mill. This in reality proved the nucleus of the present progressive industry with which his name is associated. Eventually giving up the contracting business, Mr. Eaton decided to devote his entire energies to the development of his planing mill business with what success the present operations in Orillia are an index. This took place about eight years ago. The plant was located on Andrew street, but was burned down about two years ago, and the business was carried on for a time in temporary premises. The company was incorporated in 1910, with Mr. J. R. Eaton as manager, and his two sons, Messrs. E. R. Eaton and J. H. Eaton, in association with him.

In May, 1914, the construction of the new factory on West street was commenced, the architectural and building work being carried through by the company itself. The site occupies an area of nearly twelve acres, has a frontage on West street of 500 ft. and a depth of 1,000 ft. The main building is 151 x 304 ft., one-storey high, and full mill construction. In designing the building great care was exercised in regard to the lighting and in this respect the plant will be fully equipped, adequate lighting from all four sides and skylights being provided. The flooring is of concrete, and the building generally is fireproof construction. The roof beams used in the construction are British Columbia fir, the posts being pine and hemlock, and the roof is of mill construction dressed 2-in. by 4-in. on edge. The walls of the building are built of Denison Interlocking Tile, manufactured by the Sun Brick Company, Limited, of Toronto. This material was chosen as being specially suitable for a building of this nature. It makes a light wall, a cool building in the summer and a warm one in the winter and an absolutely dry and fireproof one.

The most interesting feature of the new plant is, perhaps, the installation of a new type of dry kiln. In order to obtain reliable data at first hand a trip through the principal plants in the United States was taken by Messrs. E. R. and J. H. Eaton. The plant is therefore modelled on the latest and most approved lines, both as regards structural features and efficiency of equipment. The problem of obtaining a dry kiln which would solve the difficulty found hitherto in regard to variations in wood, necessitated the making of exhaustive tests, both in Canada and the United States. The result was the adoption of the box or pocket type of kiln, and the Grand Rapids Veneer Works, Grand Rapids, Mich., were given the order for the supply of a battery of eight fireproof box kilns of the latest type of construction. The kilns are built of hollow tile and cement with a unique system of transfers and elevator, operated by electric power, which will enable the firm to handle their lumber at a minimum cost from the railway siding to the kiln, storage and factory. An important advantage claimed for the box over other types of dry kilns is the division of the former into eight boxes, four of which have a capacity of five cars each, the capacity of the other four being two cars each. By this means variations of temperature are avoided and different varieties of lumber, either hardwood or softwood, can be dried independently of others. The kiln is 80 ft. by 62 ft., and is one of the most efficient lumber drying plants in the Dominion.



Detail of Dry Kiln.—J. R. Eaton & Sons, Limited, Orillia, Ont.

Adjacent to the kiln there is a large storage shed for drying and storing the lumber after it has emerged from the kiln. This building will be kept heated at a fixed temperature throughout the winter. By the adoption of this new process only one handling of the lumber will be necessary and the material will always be under cover. These buildings are situated at the east end of the factory. At the north side there is also a dressed lumber and freight shed provided for loading and shipping the finished product. The company is also installing high-speed machinery and several of the machines will be run by individual motors.

### The Endless Chain Conveyor

Another unique feature of the plant is the installation of the endless chain conveyor for carrying shavings and waste material to the furnace. The endless chain conveyor renders hand firing unnecessary and no air is blown into the furnace. This idea was obtained by Messrs. Eaton while on their trip in the United States, and it is claimed that this equipment is the first of its type to be installed in Canada.

The plant, when working at full capacity, carried about one million and a half feet of lumber, but with the added development made possible by the construction of the new plant it is expected that considerably larger quantities will be stocked. The company have about a mile of sidings on the G. T. R. with interswitching connection to C. P. R. and Canadian Northern. Shipping and other facilities are therefore unexcelled.

The firm do all sorts of mill work, including exterior and interior finish and hardwood flooring. Woodwork for offices, apartment houses, stores, dwellings, etc., is manufactured, also veneer doors. Hardwood flooring is one of the firm's specialties. A considerable portion of their operations, consists of hardwood interior finish to architects' details. An important item of the business for a number of years has been milling work in transit, this work being done mainly for wholesale lumbermen. The lumber is shipped in the rough to Orillia where it is dressed and reshipped to destination. For this the firm have the best equipment on the market and a reputation for doing first-class work.

The firm use all the commonly-known Canadian woods, including pine, birch, maple, spruce, hemlock, basswood and ash. Imports, such as Southern pine, oak and mahogany and cypress are also used.

The power is supplied by a Wheelock engine of 225 h.p., steam being obtained from two boilers of 150 h.p. each. Electrical energy, both for power and lighting, will be generated on the premises. The company do a growing business with the whole of Canada as a market, practically ninety per cent. of the finished product being shipped out of Orillia.

---

## Movement to Educate Consumer

In an interesting circular letter sent out to the lumbermen of the United States generally R. H. Downman, president of the National Lumber Manufacturers' Association, puts squarely up to the lumber trade the question "What Are You Going to Do About It?" in connection with the work of the proposed trade extension department of the National association. Mr. Downman says the many papers, reports, addresses and discussions given at association meetings and gatherings of lumbermen the last three months show conclusively:

1. That lumber consumption has fallen off in greater proportion than building construction.

2. That well-financed organizations are working for the elimination of wood.

3. That lumber is getting only 10 per cent. of the advertising devoted to construction materials.

4. That unscientific and sometimes unfair building codes unduly restrict the use of wood.

5. That wood is being made the target of anti-fire agitation when 85 per cent. of the fire loss is due to other causes.

6. That whereas the public formerly "bought" lumber, now it must be "sold" against keen competition—and the dealer feels that he alone should not bear the burden of selling the manufacturers' goods.

7. That no other structural material is marketed with so little intelligence or with so little regard to the interests of the consumer.

8. That in consequence the consumer is being rapidly educated away from wood and that unless prompt and effective steps are taken this means a permanent loss of a large part of the present market for lumber.

9. That no poorly-supported, half-starved measures will succeed, nor can anyone say "Let George do it" any longer. That lumbermen must learn what other successful merchants knew long ago—that in order to make money, money must be spent for promotion.

10. That the only way to maintain the demand for lumber is through the co-operation of all branches of the industry in a national movement to educate the consumer and promote the use of wood wherever it is the best available material or can be made equal to other materials for the service required. That the proposed Trade Extension Department of the National Lumber Manufacturers' Association offers the most effective means of doing the work which everyone knows should be done.

## Many Sailing Vessels at Halifax

The Norwegian Bark Blenheim, arrived at Halifax on May 5th after completing a quick passage for this time of year, having made the trip from Southampton, England, in 27 days. The Blenheim had an exciting time between Fredericstadt, Norway, and Southampton, avoiding mines and warships, and took longer on that voyage than it did on the trip from Southampton to Halifax. The Blenheim is a 1,029-ton bark and was consigned to Colin C. Tyrer, Halifax, to take on a load of deals for England. The arrival of the Blenheim at Halifax made nine Norwegian barks in port loading deals for the Old Country, and others were reported on the way.

# Export of Logs Still to be Allowed

## Hon. W. R. Ross Declares B. C. Manufacturers Still Have Ample Supplies for their Own Requirements

At the recent meeting of the Pacific Coast Loggers' Association, Hon. W. R. Ross, Minister of Lands for B. C., delivered an address during which he referred to the invitation in connection with the export of cedar logs from British Columbia.

"At the time of the raising of the embargo on the export of manufactured cedar logs," said Hon. Mr. Ross, "there were 25,000,000 feet of logs in the water. Since that time 77,000,000 feet have been scaled. During the time since the raising of the embargo 30,000,000 feet have been exported and 35,000,000 feet have been sawn. There is still a substantial margin left to meet the requirements for manufactured material within this province. There were exported during the months of February, March and April of this year two and a half million feet, three million and four million feet respectively The amount scaled during the same time was respectively five million, seven million and seven and one-half million feet of logs. We therefore see there is an increasing amount on hand to meet local requirements. It is not the intention of the government to replace the embargo until there is a more apparent need for it."

In the opening part of his remarks Mr. Ross referred to the advantage which British Columbia had had in the framing of conservation legislation by reason of the example set in a number of the states to the south. "At the time this legislation was introduced it was viewed with more or less suspicion on the part of the loggers in British Columbia. It was looked upon as a hindrance rather than a help. But I think the viewpoint among the loggers has changed and that they realize the government has been following along lines which will be of permanent value to the lumber industry. Lumbering is one of our basic industries. It needs help and encouragement. Some may hold that mining and agriculture are destined to be of greater importance to this province. However, opinion may differ in this respect, we must at any rate rely on lumbering for a number of years to come as the basic industry of British Columbia. It is the one from which we reap the largest income. The welfare of the industry consequently affects our people intimately and our prosperity in large measure depends on it.

"While conditions in the lumbering business have not been all that we could wish for in the immediate past, still it has given us a chance to look around and see where it can be benefitted. We find we have been depending too largely on the home market. It is now necessary that we get into the world markets. Our friends across the line have succeeded in getting an export trade sooner than we have because they went after the trade. Once the industry is again on its feet we should have a very substantial market abroad. Much of the success of American exporters has been due to their methods of advertising. We should profit by this also.

"Another matter which has handicapped the lumber interests here is the lack of tonnage. We could have supplied much more lumber for the export trade during the present time had there been sufficient ships to carry the exports of the forest. When an adjustment comes again this is another matter which should be set to rights."

---

### C. L. A. Makes Further Protest Against Freight Increases

Ottawa, May 10th (Special to the Canada Lumberman):—Further objection against the application of the railways for an all-round increase in their rates on lines east of Port Arthur was made when the Eastern Freight Rates Case inquiry was resumed today before the Railway Commission, by Mr. Frank Hawkins, Secretary of the Canadian Lumbermen's Association. He explained that the railways had obtained an increase on the basis of the advance in the price of lumber in recent years and maintained that further increases should not be allowed.

Mr. Hawkins said that if it is true that freight rates bear some relation to the value of the product and increases are permitted accordingly it follows that the rates should be reduced when prices drop, a condition which would be intolerable. He also urged that the summer rates are the normal rates and that the winter rates are abnormal on lumber, but the latter now prevail. On grain, however, the selling price of which has increased enormously during the last few months, the summer rates were peremptorily ordered to be restored by the board. Mr. Hawkins stated that the general opinion of lumbermen throughout Eastern Canada is that the present rates on lumber are at the limit that is in the best interests of all concerned.

Mr. Arthur D. Huff, as representative of the Canadian Pulp and Paper Association, again protested against the application.

It appears as though it will be at least a month before the case goes to the board for judgment. Another hearing, when more evidence will be taken, is timed for next Monday.

### Lumbermen's Credit Bureau for Toronto

At the regular weekly meetings of the Lumbermen's Section of the Toronto Board of Trade during the past month the chief discussion was in connection with the proposed organization of a Credit Bureau. A detailed description of the manner in which the Credit Bureau is operated by the retail lumber trade of Ottawa was received in a letter from Mr. D. J. O'Donahoe. The Ottawa Association, which has been in operation about two years has been very effective, and the Toronto trade appointed a special committee consisting of Messrs. Patterson, Boake, Hancock, Irvin, Eckhart and A. E. Clark to look into the plan in operation at Ottawa as outlined in Mr. O'Donahoe's correspondence, and to report upon the feasability of the plan for the Toronto trade. At the meeting which was held on May 7th this committee presented a report to the effect that in its opinion the Ottawa system was well suited to conditions in Toronto. The members of the committee had visited practically every retailer in Toronto and had found them all enthusiastically in favor of establishing a system for checking up credits by exchanging information. The members of the section then discussed many of the details of the proposal and finally decided that the same committee with the addition of Mr. W. J. Lovering should be empowered to proceed in making arrangements for the establishment of a Credit Bureau along the lines of the system which had been under discussion, and that they should report progress at the next meeting. The wholesalers of the section showed a keen interest in the proposal and expressed their willingness to do their utmost to assist it.

# Personal Paragraphs

Mr. F. G. Wheaton, Amherst, N.S., sales agent for the North Shore Shingle Association, recently called upon the trade in Ontario.

R. E. Hancock, a lumber manufacturer of Queensland, Australia, is on the Pacific Coast looking into lumber export conditions and enjoying a vacation.

J. B. Beveridge, general manager of the Dryden Timber & Power Company, Dryden, Ont., recently left on a business visit to Winnipeg and other western points.

Mr. C. O. Maus, representing the Hyde Lumber Company, South Bend, Ind., visited the trade in Ontario during the first week in May and secured a satisfactory volume of business.

W. C. Lawton, of the Lawton Lumber Company, Vancouver; B.C., recently was in Seattle on business. Mr. Lawton reports that the prairie trade has been fairly active both in lumber and shingles.

Mr. W. B. Bartram, the well-known lumberman, of Ottawa, Ont., recently visited Toronto on his return from the Pacific Coast. Mr. Bartram visited the Old Country previous to his trip to the West.

Mr. J. H. Thompson, Winnipeg, who is well known in the timber trade, visited Vancouver recently and stated that he was considering a proposal for operating cedar shingle mills at interior points. Mr. Thompson considered that the outlook for the shingle business was promising.

Mr. E. W. Tobin, M.P., will again be the Liberal candidate for the counties of Richmond and Wolfe, P.Q. Mr. Tobin owns extensive lumber interests in Eastern Canada, being president of the Tobin Manufacturing Company, Montreal; vice-president of the Lotbiniere Lumber Company; director of the Brompton Pulp and Paper Company, Sherbrooke Lumber Company, Trois Pistoles Pulp and Lumber Company, and of other companies.

Mr. Hugh A Rose, eastern representative for the Canadian Western Lumber Company, Fraser Mills, B.C., has received from the Dominion Government an order for a cargo of fir timber for the Hudson Bay Terminals at Port Nelson. The Canadian Government Steamer Durley Chine sailed from Halifax for Fraser Mills by way of the Panama Canal on May 6th. She will take on a cargo at Fraser Mills and proceed by way of the Panama Canal to Port Nelson.

Mr. William Rutherford, of William Rutherford and Sons, Company, Limited, and Mr. H. A. Acer, of the Laurentide Company, Limited, have been elected members of the executive committee of the Montreal branch of the Canadian Manufacturers' Association. At the annual meeting Mr. Rutherford, chairman of the Branch Legislation Committee, emphasized the importance of the adoption of the principle of non-taxation of machinery for municipal purposes, and detailed the various measures in which the association had taken an interest at the recent session of the Legislature.

## Ocean Freights May Be Easier

The following reference to ocean freight rates appeared in the Timber Trades Journal of April 24th:—In the Canadian and American wood freights market business continues very slow in the chartering of steamers for wood cargoes. Shippers of Canadian deals and of pitch pine from the Southern States are still actively inquiring for boats, but at rates of freight to which owners have so far given little or no consideration, and the figures have been beyond charterers' ideas. However, as other cargoes offering have become much fewer in number, and grain and cotton shippers appear to have pretty well filled their requirements for the present, owners will probably turn their attention to wood and bring their demands more into line with the rates which merchants are quoting, say a basis of 130s. from St. John, 132s. 6d. Bay of Chaleurs, 135s. Miramichi, etc. Sailing vessels have also been, and still are, in request, but the supply of suitable carriers offering remains very limited, and in their case also the difference between owners' and shippers' ideas of rates has hampered chartering. From the North Pacific grain merchants are pressing the market, and continue to offer increasing money to secure tonnage, and lumber merchants for the present do not appear to offer any serious competition."

---

An interesting bulletin entitled "Tests of Wood Preservatives" has been published by the United States Forest Service. The tests were made upon thoroughly air-seasoned eastern hemlock. The bulletin is of a technical nature, but contains much information which will be of interest to those who are concerned in the use of wood preservatives.

---

## A Modern Woodworking Plant

The James Smart Manufacturing Company, Brockville, Ont., have recently constructed a modern fireproof building for the use of their woodworking department. The building measures 50 ft. by 105 ft., and is three storeys high. The accompanying illustration gives a good idea of the appearance of the plant and shows that it has been designed with special reference to providing ample and well-lighted accommodation for the manufacturing operations of the woodworking department. The building is constructed of reinforced concrete throughout, including the floors and roof. The company have endeavored to make the building thoroughly fireproof in every particular. For this reason there is no communication between the floors except by an exterior stairway tower. The building is steam heated and electric lighted throughout. The machinery installed is of the best modern type for the work required. The motor power used is electrically supplied from the town plant and an independent motor is used on each floor. A large elevator is installed in the tower giving access for all kinds of material to the three floors with outside delivery on the ground floor.

On the first floor are installed machines for the production of packing cases and crating of all kinds, and also for making hammer and other tool handles. The rough cutting up of all lumber to be used in the upper floors is also done on the first floor. On the second floor are located the principal machines for manufacturing the various wood products which the James Smart Manufacturing Company distributes throughout Canada. These products include school furniture of all kinds, plumbers' woodwork, and a great variety of small articles used in connection with the company's hardware trade.

The third floor is used as a finishing room and for assembling, packing and shipping the various products of the factory.

**The James Smart Manufacturing Co.'s Woodworking Plant—Brockville, Ont.**

## Adaptations of the Horizontal Resaw

By E. M. McCormick

It is perhaps impossible to say just what motive or what mixture of motives is responsible for the introduction of the horizontal resaw into this country, says The Woodworker. Since its introduction, however, it has been adapted to lines of work that perhaps were not thought of at all in the original conception.

Primarily, the horizontal resaw seems to have been designed here to resaw short lengths that it is impossible to handle on the regulation band resaw. It carried with it a hopper feed, and the first one the writer remembers to have met with was designed specially to resaw box factory stock—short lengths of stock after they had been cut.

In refining low grade and cull lumber to get box stock it is often best to get rid of the cull part and waste before resawing, otherwise there is a lot of material to handle and resaw that does not produce anything. To refine it means to reduce it to short lengths, and hence the horizontal resaw.

Pretty soon the horizontal resaw idea began to attach itself to other things, among them its use for cutting up slabs and cull stock at the saw mill into shooks and boards. And a still later adaptation is the attaching of a horizontal resaw to the back of a double-surfacing planer, so that lumber is surfaced and resawed all at one handling and it becomes practically all one operation.

This is perhaps one of the latest adaptations of the horizontal resaw idea, and its original purpose seems to have been that of resawing bevelled siding as it comes through the surfacer without having to handle it again.

Of course, with a surfacer and this horizontal resaw mounted on the back end, one cannot only resaw bevelled siding, but some of the mills follow out the idea of resawing flooring and ceiling. That is, of matching it in double thickness, surfacing both sides and resawing, to get twice the amount of work through.

It is questionable just how successfully this plan may be carried out. It is difficult to resaw with such perfection as to give the exactness in thickness essential to good work in the making of flooring and ceiling. The fact remains, however, that some mills are doing this right along.

The best opening, apparently, for this adaptation of the resaw, this putting of the horizontal resaw on the back end of a surfacing planer, is in the resawing of box lumber and other stock of that kind. Box lumber is often surfaced on both sides and then run through a resaw, and if this is the plan being followed by the box factory it should simplify operations to have a horizontal resaw made on it as part of the surfacer, so that one time handling will do both jobs. It will naturally require a little closer attention and more skill and manipulation, but where there is enough work to justify, it is perhaps a money-saving proposition.

Anyway, this making of the horizontal resaw as a part of the surfacing planer is one of the new adaptations that is receiving quite a lot of attention now, and we will probably hear and see more of it in the near future. What other heretofore unthought-of lines it may branch out into remains to be seen. It has gone further already than was conceived in the original purpose of the resaw in this country, and apparently we are only beginning its development.

---

## The Practical Lumberman

An exceptionally valuable publication for lumbermen, entitled "The Practical Lumberman" written and published by Bernard Brereton, Tacoma, Wash., has just appeared in its third edition. The book contains a large amount of useful information pertaining to the leading commercial woods of British Columbia and the Pacific North West States. While the treatment of some of the subjects is necessarily brief it is remarkably to the point in every instance and cannot fail to be valuable to both buyers and sellers who are interested in Pacific Coast forest products. A very generous portion of the book is devoted to Douglas fir. It is impossible to indicate the variety of information contained upon this valuable wood. It is safe to say however, that every experienced lumberman who is interested in Douglas fir will find pointers in this book which it would be difficult for him to obtain anywhere else. The author of the book has had a very wide experience in the lumber trade and industry in Liverpool, Montreal, British Columbia, and Washington. The third edition contains all the important information included in the previous editions and added articles on solid and veneer doors, and on silos. The book is published at the price of $1.50, and may be secured from Mr. Bernard Brereton, P. O. Box 1158, Tacoma, Wash.

---

A report from Scotstown, P.Q., states that a large amount of square birch which has been piled in that district for some time has commenced to move out. The stock belongs to the Pejebscot Pulp & Paper Company, who are shipping ten carloads of logs to London, England.

# The Lumber Industry of Central British Columbia

(By F. S. Wright, Commissioner of Publicity, Prince Rupert, B.C.)

A great injustice was rendered the district of Prince Rupert in the early days of development, when our fathers who sit in council at Victoria, and preside over the present and future development of British Columbia, chose to designate as "Northern British Columbia" that part of British Columbia which lies north of Vancouver Island. To the average man the word "Northern" spells cold and bleakness, and he does not take the trouble to enquire further. He is satisfied

1500 cedar poles for export, Masset Inlet, Queen Charlotte Islands.

that the designation applied means remoteness, and that suffices. We in Prince Rupert particularly take exception to this title, as while it is true Prince Rupert lies six hundred miles north of Vancouver, it is still about eight hundred miles south of the boundary line between British Columbia and the Yukon. Hence the justification of the claim she makes as to being the most central point on the Canadian Pacific Coast, with—since the completion of the Grand Trunk Pacific Railway—the quickest and most direct through route to Winnipeg, Eastern Canada and the eastern part of the United States, a route with a maximum ruling grade of one-half of one per cent., a first-class roadbed and one of the best examples of solid engineering on the American continent. Eight years ago Prince Rupert was only a surveyor's camping ground. Today she is a city of 6,000 people, with permanent buildings and large industries. In a bound, since the 3rd of September last, when an actual through schedule was inaugurated over the new transcontinental route, she has become recognized as a competitive factor on the Pacific Coast. An ordinary map of Western Canada will show you that in order to reach the larger part of the prairie provinces from the Pacific Coast a line drawn east along the route of the Grand Trunk Pacific Railway from Prince Rupert strikes through the centre of the prairie provinces clear through to Winnipeg. Hence the argument—lumber is bulky, transportation consequently high, and the shortest and most direct route must be the natural one. That is a matter of economics.

Below are given a few particulars as to the material available adjacent to Prince Rupert in Central British Columbia, and these particulars, taken into conjunction with the excellent transportation furnished both by sea and rail, go far to show the advantages of Prince Rupert as a central shipping point for the lumber industry of Central British Columbia.

### State of the Industry in British Columbia

The enormous demand for lumber on the prairies, caused by the unprecedented influx of population during the last decade, which reached its highest point in 1913, and the consequent activity in British Columbia, from whence the major port of the material used in this industry was obtained, caused a frenzied haste on the part of capital to install plants in order to cope with the extraordinary demand. In consequence plants were erected throughout British Columbia capable of supplying the demands of a ten million population, where the actual market was only about one and one-half millions. Naturally, when the rush slackened, as happened in 1913, over-production followed, operations were curtailed, numerous plants in which large capital had been invested became idle, and unemployment ensued.

The central portion of British Columbia, with Prince Rupert as its centre, fortunately escaped this slump and has therefore no "regrets" to offer for larger mills geographically misplaced. Quite to the contrary, Prince Rupert has been able to keep not only its own two small mills running full capacity in filling orders for the local trade, but has also been a heavy buyer of manufactured lumber in the south, and used in the construction of the dry dock and for other uses on the Transcontinental Railway. The reason why Central British Columbia was not so affected was due chiefly to the fact that, outside of two large plants, which endeavored to compete with the southern mills, it was catering only to the local demand, with small plants, the upkeep of which was possible even during the slump, owing to the lessened cost of overhead expenses, as compared with the larger concerns. The field they covered formed a steady market for all they could produce. The opening of through communication with the East by rail has had the effect of widening this market from a purely local one to one only bounded by the hauling capacity of the railway. The traffic rates as far east as Edmonton, allow the lumbermen of this district to compete with Vancouver and other points south. As to lumber, and in the production and marketing of shingles, they are able to ship on an equal basis as to transportation, and in addition can produce a shingle of superior quality, both as to texture and strength.

5 ft. yellow cedar, Prince Rupert, B.C.

The year 1915 seems to be the eve of another era of activity in the lumber trade of British Columbia, due chiefly to the fact that the raw material sources of Europe are at the present time practically closed and consequently the great market of Great Britain is experiencing considerable difficulty in obtaining raw material necessary.

The new system of towage, two rafts or cradles with one million feet.

This supply, usually drawn from Sweden, Norway and Russia, has ceased to all intents and purposes, and in consequence Great Britain is looking to the American continent for her supply of raw material. The opening of the Panama Canal has opened up a much shorter and direct all-sea route to this market and the markets of the Eastern States and Canada, effecting a considerable saving in water carriage, so important to the lumber industry of the West Coast. While Central British Columbia, owing to the further haul and inferiority of methods of production, cannot hope to compete at the present stage on a favorable basis with southern points, she can do so in some lines, such as cedar poles, of which the district has an unequalled supply available, and this fact, combined with the steady increase of her interior market, of which, owing to strategic position, she must have nearly the monopoly, will enable the lumber industry of this district to obtain a satisfactory start on the road to profitable permanency.

### Raw Material Available

In giving the following particulars as to the amount of raw material available in the district of Central British Columbia, of which Prince Rupert is the natural centre, only timber is included which is adjacent to salt water and is of present commercial value. In 1914 the total cut of the district, which is roughly 200 miles long by about 30 miles wide, was approximately 12,000,000 feet board measurement —this figure including cedar poles and piling. The figures mentioned show an alarming decrease over those for 1913, when the cut was approximately 26,000,000 feet board measurement, but with the renewed activity this year it is expected that the year 1915 will show a substantial increase. The Forestry Department of the Provincial Government's estimate, made on a careful basis of cruising, gives the total area of available timber lands adjacent to Prince Rupert as 25,000,000 acres, averaging over 15,000 feet to the acre. Of this 300,000 acres average over 25,000 feet to the acre. The general composition of the stands are spruce 50 per cent., red cedar 20 per cent., hemlock 20 per cent., balsam and yellow cedar 10 per cent. In addition to the above there is a large area of approximately 17,000,000 acres which will be available in the next fifty years for commercial purposes.

### The Interior Country

In the interior, along the Grand Trunk Pacific Railway, as far east as Fort George, there is timber suitable for local sawmills and pulp plants. This will eventually be used in supplying local needs for rough lumber, but owing to the fact that the limits are held in small units by numerous individuals, and the consequent difficutly in the obtaining of control over an area sufficient to justify the erection of extensive pulp plants, it is doubtful whether capital will take the hazard of entering seriously into the pulp business in the interior for some time to come. Whilst the Skeena and the Naas are two of the very few rivers that are drivable and have sufficient supplies of pulp in sight, the fact of the small holdings must militate seriously against exploitation. This is a most important point where large plants such as pulp and paper mills are contemplated. It is not the present, but the future supply which counts. There will also be a demand in the interior for mining timber, as development in this important industry progresses. Whilst the demand for rough lumber in the interior can and no doubt will be met locally, the market for the higher grades of lumber, including the finished product, will belong to the Coast mills. There is a large area of arable land available for agricultural purposes in the interior of Central British Columbia, tapped by the Grand Trunk Pacific Railway. This is being settled steadily by a good class of settler, and hence the future development must mean an increased market for the output of the Coast mills tributary to Prince Rupert.

### Lumber and the Fishing Industry

At the present time there are forty-two canneries and five large cold storage plants operating in the Prince Rupert district. The salmon pack for 1914 was approximately 330,000 cases. These figures exceed the Fraser River pack by about four thousand cases. The quantity of fresh fish landed at Prince Rupert in 1914 was 376,121 cwts. From September to December, 1914, approximately 4,000,000 lbs. of fish was boxed and shipped over the Grand Trunk Pacific Railway to points in the East and Europe. In January, 1915, approximately 750,000 lbs. of fresh fish was landed in Prince Rupert and shipped to Eastern markets. A further increase in amount landed and shipped is expected for February and onward throughout 1915, with the eventual possible feature of Prince Rupert obtaining the control of the reception and shipping business of the enormous fishing industry of the Northern Pacific. This is apparent to anyone who may choose to follow the agitation and concernment of Seattle and other southern cities which, previous to the entry of Prince Rupert into the competitive field for this industry, held control of the business. Every effort is being made to prevent Prince Rupert from obtaining this business, and every effort, with good prospects of success, is being made by Prince Rupert to win and hold it.

It is obvious that this fish trade means an increased demand for boxes and for lumber for cannery repairs, etc. Owing to the rapid deterioration of buildings, large quantities of lumber are used yearly by the canneries and other plants engaged in the fishing business. At the present time only two mills locally are making a serious effort to get this business. The combined capacity of these two mills is about 37,000 feet per diem. Out of the total number of boxes used for the salmon pack yearly only about 20 per cent. are manufactured locally; the remaining 80 per cent. are manufactured in the south and shipped to the district at prices ranging from 15c. per case to 18½c. per case, delivered freight paid where the freight does not exceed 1½c. per case. In addition approximately 650,000 feet of lumber is used for repairs. This is for the salmon pack alone. In addition to this are the halibut shipments, which now average, as stated, nearly 750,000 lbs. per month. Most of this must be boxed for shipment. There is also the requirements of the box trade in connection with cured fish, and barrels for the salt herring industry. These figures speak for themselves as to the possibilities of Prince Rupert as a centre for the box industry.

### Lumber and the Shipbuilding Industry

The year 1915 will witness the completion of the dry dock and ship repair yards, built and controlled by the Grand Trunk Pacific Dry Dock & Ship Repair Company. This dock is capable of handling any kind of vessel on the Pacific Ocean. It is absolutely modern in every respect, and one of its avowed purposes is the building of motor trawlers, coasters and all the various types of fishing and pleasure crafts. This will entail a large demand for the higher grades of lumber used in boat building. The dock is certain to become a large user of this material, and it will be also operated as a supply point for the material required by smaller shipyards located at Prince Rupert. The abundant facilities offered by the larger concern are bound to create smaller subsidiary plants of a similar description, owing especially to the facilities offered in the way of dockage and the supply of machinery parts by the larger concern. Even at the present time no mill can keep up with the demand for the higher grades of boat building material.

### The Retail Trade

At the present time the retail lumber trade is quiet, but this is due mostly to the fact that the outbreak of war had the effect of curtailing local development to a considerable extent. However, the interior even at the present time is furnishing an increased demand for finished lumber, which is fast becoming more apparent. This demand is increasing in such a way as to forecast a steady market in the future,

Scaling spruce raft at Metlakatla, opposite Prince Rupert, B. C.

without the possibility of over-production through boom causes. Experience has shown that with regard to the box industry, unless operated as an adjunct to a sawmill, it is impossible to do business on a competitive basis with sawmills that use part of their product for this purpose. Factory lumber for box making, the only available supply of which comes from the south, is only 75 per cent. clear, and the wastage of at least 25 per cent. in raw material alone is unavoidable.

### Towage of Logs

A new system of towage has recently come into prominence, and has had the effect of making the towage of booms handier and less expensive. Under this method logs can be handled in rough water, where it is impossible to handle an ordinary boom, and the method has enabled logs to be towed across rough water, such as the Queen Charlotte Sound, with best results. Instead of booming the logs in the old way a cradle is formed by means of chains, three chains being laid crosswise and a layer of logs laid on them, then a layer of chains and a deck of logs, continuing alternately until the boom is made up. The last chains go completely around the cradle, which has a capacity of one-half million feet. The cradle draws 20 feet of water, is cigar-shaped to make towage easier, and the entire method renders the question of long water haulage a much more facile and economical matter.

### Government Supervision of Timber

The excellent work of the Forestry Department, recently installed by the Provincial Government with the view of protecting British Columbia timber resources, has rendered the location of suitable stands for commercial purposes on Crown lands a comparatively easy matter. The particulars of tenure, stumpage and log values are generally well enough known as applied to British Columbia. The cost of manufacturing and labor is slightly higher than in the south.

An important factor in the question of the cost of operation is that of the climate. The rainfall on the coast of Central British Columbia is heavier than on the southern portion and consequently more time is lost in the woods owing to bad weather, but as these wet spells generally occur at certain fixed periods of the year, and also owing to the fact that this rainfall is universally calculated on, it is possible to get labor to operate in all except the very heaviest weather without any difficulty. The men do not seem to mind the dampness, as they soon get accustomed to it.

In conclusion, while Prince Rupert can and does look forward to the time when lumbering will be an important feature of the industries of Central British Columbia, she is under no delusion as to the limits of her ability to compete in the world's markets. What Prince Rupert does expect and claim is that the lumber industry of British Columbia, with its interior market, its market on the Prairies as far east as Winnipeg, in some lines also to the United States, Eastern Canada and Europe, is in its infancy; that it has a large undeveloped future market locally, and that under the right management and procedure this market is available for profitable exploitation and belongs to Prince Rupert by right of raw material available and her strategic position in relation to these markets.

## B.C. Timbers in Great Britain

The Timber Trades Journal, London, England, in its issue of April 24th, says:—"The export timber trade on the Pacific Coast of America is passing through a period of severe depression, largely due to the reduction of business in the various consuming countries owing to the war, and the opening of the Panama Canal has not yet benefited the trade, so far as shipments to Europe are concerned, owing to the extraordinary rise in freights. British Columbia appears to have been more severely affected than the neighboring States of Washington and Oregon, the Colonial mills having been unsuccessful in disposing of their productions. Notwithstanding the present depression in the trade, the conclusion that our correspondent has arrived at is that a big trade will develop in the near future from the Pacific Coast to Europe, after the war, and when normal conditions are restored. Already considerable contracts have been made for the supply of Columbian pine sleepers, and it is understood that this wood is preferred to pitch pine when creosoted. The preserving process, however, which is necessary to obtain a satisfactory impregnation of the wood is somewhat different to that usually adopted for treating Baltic fir."

## William R. Perrin, Limited

William R. Perrin, Limited, is the name of a new company formed recently to take over the stock, machinery and foundry of the William R. Perrin Company, Limited, at Toronto, specializing in the manufacture of Veneer, Veneer Dryers and Pulp Presses. The firm are also especially equipped to take care of orders for special machinery. They are building at the present time a 200-ton hydraulic Veneer Press with platen 50 x 74 inches for Hay & Company, Limited, of Woodstock, Ont., which will make the second Perrin press this firm will have installed. Mr. Wm. R. Perrin, son of the late Wm. R. Perrin, is President of the new company.

## Lake Vessels for Ocean Trade

The scarcity of ocean tonnage and the high rates ruling for freight carriage are inducing lake navigation companies to send vessels to the Atlantic service. The Canada Steamship Lines, Limited, will put 15 vessels of its line on the Atlantic, it has been learned, and other lake navigation companies are expected to follow suit. The British Admiralty is also arranging to release a number of Canadian vessels belonging to the regular lines, substituting smaller ones in their places, and this is expected to assist in relieving the situation.

## News from the Drives in Eastern Canada

Over 13,000,000 feet of logs to be manufactured at Victoria Mills, N.B., have been brought out by Fraser, Limited.

Mr. F. M. Tweedie, Mayor of Chatham, N.B., reports that the cut of lumber on the Miramichi this year will probably be greater than it has ever been before.

Reports from Fredericton, N.B., under date of May 7th stated that the water in the St. John River had fallen slightly from its freshet height. The warm weather however, was keeping the level up satisfactorily. Logs had been running into the booms freely for several days.

A large amount of damage has been caused in the Laurentian Mountain district near Weir, P.Q., by the bursting of the dam on Balsam Lake. The water rushed down through other connecting lakes, carrying away the dams, and sweeping thousands of logs into Round Lake. There, it destroyed a saw mill belonging to J. and W. Duncan, Limited, of Montreal. In addition, about 500,000 feet of manufactured lumber and several rigs were carried into the lake. Two bridges and part of the railway track were also badly damaged.

Favorable reports have been received from nearly every drive on the Upper St. John River, N.B. Plentiful rains have occurred, causing the water to rise extensively. Reports from central parts of New Brunswick are less satisfactory on account of scarcity of rain. A despatch from Fredericton stated that the main dam towards the head of the Nashwaak River had been partially carried away. Senator N. M. Jones, general manager of the Partington Pulp & Paper Company, reports that although the water in the Nashwaak River is low, warm weather and a little more rain will bring out his company's large drives.

## Death pf Bernard Quinn

The passing away of Bernard Quinn, at Windsor Mills, P.Q., recently, removed one of the best known men in the Eastern Townships. The deceased had been in failing health for the past four years, and the news of his death, while not unexpected, will be received with deep regret, for "Barney" Quinn had a wide circle of friends. He was a large lumber dealer and a director of the Lotbiniere Railway and Lumber Company; the Sherbrooke Lumber Company, the E. T. Telephone Company, and several others. Deceased, who was 66 years of age, leaves a widow and one son.

## Well Known B.C. Lumberman's Death

The death is reported of Joseph James Lemon, Victoria, B. C., one of the best-known builders and lumbermen of that city and a member of the widely-known Lemon, Gonnason Lumber Company, of Victoria, B.C. Mr. Lemon was born in New York City, on February 26th, 1856, and went to Victoria in 1887.

Allen James Moore, of Bulwer, P.Q., who had been connected with the lumber business at that point for the past twenty years, died recently in his 69th year.

At a recent meeting of the Dominion Board of Railway Commissioners held in Ottawa the proposed increases in the freight rates upon lumber were brought up again by Mr. Walsh, representing the Canadian Manufacturers' Association. Mr. Walsh read a letter from the lumber producers and dealers of Hamilton, Ont., in which they said that the proposed advance of ½c. per hundred lbs., on lumber would mean a combined loss to them of $12,500 per year, and on account of the close prices upon the commodity, there was practically no possibility of recovering this amount from the customers.

The Lake St. John region of Quebec, is in a very prosperous condition just now, owing to activity in the ground wood business. This is one of the districts where log-cutting was actively pursued on a large scale all winter. Fortunately, also, the Price Brothers' paper mills, unlike some of the others, are running full time, and are booked up ahead.

## Secrets for Operating Bandsaws Efficiently

By L. R. Brown

Bandsaws, and what it means to care for them, is a problem that leads one into careful workmanship and careful thought. In thinking of the many things we have to look for at all times, the many intricate annoyances that always are present wherever they are in use; one can aptly compare the whole to the feat of walking a tight rope.

Equilibrium on an unstable centre, of course, is the trick in itself. But this equilibrium cannot be acquired, or maintained, or kept under any degree of control unless one is able to grasp a correct mental poise. If too much of the acrobat's attention is centered on a single feature of the trick, his negligence on the other conditions would make him all the more liable to lose his balance, than if he was able to divide his attention to cover the whole situation. The whole must be taken in at a glance, and this poise or that poise be taken, as the centre of equilibrium changes.

So in the matter of caring for bandsaws; the whole must be considered as a whole, continuously and cautiiously. If one centres too much energy in caring for the teeth without other precautions, the tension, or some other part of the work will soon become impaired. Too much rolling for tension without first looking to the levelled condition, invites trouble; and to spend all of the time in the filing room, without giving the proper care and attention to the necessary repairs on the machine, when conditions require it, is a considerable waste of energy; and the results will only be indifferent and unsatisfactory at the best.

To obtain the best possible results, all these things—and a hundred others—must all be observed at a glance, and be done at the proper time. A little too late, or a little too soon will not do; things done at exactly the right time are what count in keeping a force of bandsaws in a condition to hum a good lively tune at all times.

Neglect is a strong factor in a good saw-fitter's downfall; and diligence and careful workmanship are equally as strong factors in one's success. Diligence and activity of mind and thought are, first of all, essential to good results. The problems to be worked out, must first of all be located. And there are certain rules that apply to certain conditions that are helpful, but none are invincible.

One should not allow himself to get the idea that he has all there is that can be done laid down in a certain set of rules, and after getting them all memorized and down pat, that is all there is to it. There are no hard-and-fast rules that will apply to all saws in all cases. One must always be alert and on the lookout at all times for the places where "rule" methods are at fault, and ingeniously work out methods before things get to going wrong.

Of course, tension in all cases means the same thing, but the degree, or amount required must be determined after carefully considering the quality and quantity of work expected, and the nature of the stock to be sawed. Good straight cuts cannot be made with too much tension any better than they can with too low tension. The exact amount of tension is the problem in this case, and cannot be determined by any fixed rule. It must come from practical experience.

Too much swage will ruin the cutting qualities of an otherwise well-fitted saw. If one attempts to run a wide swage, that a low or medium tension will not support, he may try a very strong tension and find he has made some improvement; yet unless he knows where the danger line in that direction lies, he can very easily walk into serious trouble unless he knows where to stop.

If a 36 or 34 tension will not hold an 18 or 19 gauge resaw up to a straight line, something is wrong besides the tension. If a 44 or 42 tension will not hold up a 14 or 15 gauge log saw, it is of no use to go any farther in that direction. Something else is wrong. Not the tension.

If something is wrong with the machine,—perhaps it may only be that the sawyer is running the saw too much on the cross-line—and cracks begin to appear. It does not matter what tension is being used. Any change of tension will not result in any material good. More tension will only add to the dangers of more cracks; less tension will only make the saws run more poorly. Just have a little friendly talk with the sawyer, and if the sawyer is a good fellow, and you are just what you ought to be, there will be an end to the trouble then and there.

If one of the wheels are loose on the shaft, the same results may show up in the saws. And as in the above-mentioned case, a change in the tension, or anything you can do in the filing-room, will be worse than a waste of time. It will be only as the old saying goes, "adding insult to injury." Have the necessary repairs made, so the wheels will remain firm and tight on the shaft, and all the trouble will be over.

Improperly adjusted guides may cause cracks, or may cause the saws to make crooked cuts; yet it is worse than useless to attempt to fix the saws in the filing-room so it will make straight cuts under adverse conditions. It is much easier to fix the guides, and in fact, it is the only satisfactory way out of the trouble.

And so it is from start to finish, with the man who does the fitting for bandsaws. No matter if they are wide or narrow, thick or thin; and no matter if the difficulties are of slightly annoying, or perplexing nature—there is usually an easy, simple way to get out of the trouble, and usually the shorter method is the most effective and satisfactory.

All the "secrets" of the business are only those incidents of everyday occurrence, and no one could expect to be told by others so they would be able to use them effectively in their own work without exercising their own wits in the matter, for they would not apply to different cases with equally good results. And no one who thoroughly understands how complex those little incidents are, would ever attempt to apply them as fixed rules.—Berlin Quality.

---

## Miscellaneous Trade Paragraphs

The Hastings Mill, Vancouver, B.C., is at present working overtime on several large contracts, including one for 4,500,000 feet of lumber for the new Government dock at the foot of Salisbury drive, Vancouver, and another for 3,000,000 feet to be used for street planking in Prince Rupert.

A recent report from Craigellachie, B.C., stated that an extensive forest fire had started in the Eagle River Valley, two miles west of Craigellachie. The woods were dry and a high wind spread the flames rapidly, until they became uncontrollable. The fires destroyed large quantities of cedar posts and much valuable timber. It is believed that the fire started from burning brush piles on settlers lands.

Indications of substantial improvement in trade conditions are reported by Mr. S. Huddleston, of the Mankin Lumber Company, with yards at Hall, B.C. Mr. Huddleston recently stated that his company expected very shortly to close a contract for 4,000,000 feet of white pine to be delivered in the United States. Of this order 2,000,000 feet is to be shipped within the next four months and the balance during the following four months. Mr. Huddleston also mentioned other important orders secured by his company as evidence of the fact that business conditions are improving.

From November 1st, 1914, to April 27th, 1915, the T. & N. O. Railway carried 72,000 cords of pulpwood, which is more than the total shipments for the whole of 1914. Mr. J. L. Englehart, chairman of the T. & N. O. Railway Commission stated that there were also 36,000 cords stacked and sold, and 19,000 cords stacked that would be sold and shipped a little later on.

The Ottawa Valley mills are now all in operation. Recent rains have greatly improved the driving conditions. This applies, it is reported, to a great deal of northern Ontario. Trade conditions in Ottawa are a little more active than in most parts of the province.

---

## New Dominion Parks Regulations

By an Order-in-Council passed by the Dominion Government on April 30th, the regulations relating to the removal of timber from Dominion Parks, formerly in effect, have been rescinded and new ones substituted. The dues for cutting timber in Dominion Parks provided by the new Order-in-Council are as follows:—

The dues to be charged for dry wood shall be as follows:—

A. For timber, mining props, railway ties, posts and rails measuring:—

(1) Eleven (11) inches and over in diameter at the butt end, one-fifth cent (1-5) per lineal foot.

(2) Nine (9) to eleven (11) inches in diameter at the butt end, one-tenth (1-10) of a cent per lineal foot.

(3) Five (5) to nine (9) inches in diameter at the butt end, one-twentieth (1-20) of a cent per lineal foot.

(4) Under five (5) inches in diameter at the butt end, free, if piled separately and thus made available for inspection.

B. For cordwood, twelve and one-half (12½) cents per cord. Wood to be classed as cordwood must before removal be cut into lengths not more than four (4) feet.

The dues to be charged for green wood shall be as follows, payable on issue of the permit:

A. For timber, mining props, railway ties, posts and rails measuring:—

(1) Eleven (11) inches and over in diameter at the butt end, three-fifths of a cent (3/5c.) per lineal foot.

(2) Nine (9) to twelve (12) inches in diameter at the butt end, three-tenths of a cent (3/10c.) per lineal foot.

(3) Five (5) to nine (9) inches in diameter at the butt end, three twentieths of a cent (3/20c.) per lineal foot.

(4) Under five (5) inches in diameter at the butt end free, if piled separately and thus made available for inspection.

B. For cordwood, twenty-five cents (25c.) per cord. Wood to be classed as cordwood must before removal be cut into lengths not more than four (4) feet.

# WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## Wanted–Lumber

### Wanted to Buy

Inch Cedar suitable for boats. Box 184, Canada Lumberman, Toronto. 9-12

### Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

### Wanted to Buy

Birch, Oak, Maple, Ash and Elm. Apply by letter, stating prices, thicknesses, lengths, average widths, quality, also name point of shipment, to Robert Cox & Company, Hope Building, Ottawa, Ont. 7-10

### Wanted – Rock Elm

250,000 to 350,000 feet of 10/4 No. 1 common and better, standard lengths, 6 ins. and wider. Will take the stock green or dry. Address American Lumber & Manufacturing Company, Pittsburg, Pa.

## For Sale–Lumber

### Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
c Montreal, Que.

### For Sale

PILING, any length in Spruce, Red, White and Jack Pine or Hardwood.
Telegraph Poles, Ties and Fence Posts. Square Cedar and Hemlock up to 12 in. x 12. Correspondence solicited.

ANGUS PRENTICE & SON,
189 Arthur Street,
9-14 Toronto, Ontario.

### FOR SALE

**Norway and Jack Pine—Mill Run**

| | |
|---|---|
| 1 x 4/5 x 10/16 ft. | 1,000,000 ft. |
| 1 x 6 | 500,000 ft. |
| 1 x 8 | 85,000 ft. |
| 1 x 10 | 14,000 ft. |
| 2 x 4 | 165,000 ft. |
| 2 x 6 | 220,000 ft. |
| 2 x 8 | 320,000 ft. |
| 2 x 10 | 218,000 ft. |
| 2 x 12 | 65,000 ft. |
| Norway Pine Culls | |
| 1 x 4 and up x 10/16 ft. | 1,500,000 ft. |

DEVON LUMBER CO.,
5t.f. Ottawa, Ont.

### For Sale

100,000 ft. hard maple lumber, 1-in. thick, 8 to 16 ft. long. Would sell mill run or selected. J. Finlay & Sons Company, Norwood, Ont. 10

### We Have a Full Stock

of Hardwood, Hemlock and White and Norway Pine Lumber, Norway and White Pine Piling, up to 60 ft. Keenan Bros., Limited, Owen Sound, Ont. 3t.f.

## For Sale–Machinery

### Woodworking Machinery For Sale

1 No. 51 Crescent universal woodworker; 2 24-in. planers and matchers; 3 12-in. buzz planers; 1 12-in. four-side moulder; 1 No. 802 Canada Machinery Corporation shaper; 5 30-in. Ideal pedestal bandsaws; 2 No. 619 Canada Machinery Corporation saw tables; 1 36-in. double drum sander; 1 20-in. American wood scraper.

H. W. PETRIE, LTD., Toronto.

### Rebuilt Veneer Machines

We have the following rebuilt veneer machines ready for immediate shipment.
1 Coe Lathe, 50-in. swing, 88-in. knife, 6-in. spindles.
1 Coe Lathe, 50-in. swing, 64-in. knife, 5-in. spindles.
1 Coe Lathe, 50-in. swing, 76-in. knife, 6-in. spindles.
1 Coe Lathe, 42-in. swing, 60-in. knife, 3⅜-in. spindles.
1 Coe 100-in. Power Clipper.
1 Coe 54-in. Power Clipper.
1 Coe Type A. Stamper.

These machines are decided bargains and carry the same guarantee as we give our new ones. Prices on application.

THE COE MFG. COMPANY,
Painesville, Ohio.

## Wanted–Machinery

### Wanted

A second-hand House or Koval Filing Machine in good repair. Address, Herron Brothers, Limited, McKinnon Building, Toronto. 10

## Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra.
**Minimum charge 25 cents**

Band and saw filer wants position. Strictly reliable, steady and up-to-date. Thoroughly dependable. Best references. Box 181, Canada Lumberman, Toronto. 8-11

Band Saw Filer wants Position. A1 reference; fifteen years' experience. State what you have in first letter. Address A. W. Woodward, 57 Kirkwood Street, Akron, Ohio. 9-12

I'm in a position to go on the road with a good responsible Wholesale Lumber firm, hardwood lumber, soliciting orders or shipping stock or manager of proper firm. Good oonduct; 30 years old; unmarried. Experience from stump to foreign markets. Best of references. Box 199, Canada Lumberman, Toronto. 10

Expert Band Saw Filer wants position. Fourteen years' experience on single and double cut saws. No proposition too large. Guarantee satisfaction in hard or soft woods. Strictly sober. A No. 1 reference. Address Saw Filer, P. O. Box 592, Memphis, Tenn., U.S.A. 6-10

WANTED—Position by experienced Band Sawyer. Sober. First-class reference. Address Frank Weston, P. O. Box 59, Odanah, Ashland County, Wis. 9-12

## Business Chances

WANTED practical man with some capital to take over an established wood-working business now manufacturing wood mantels with other special lines. Located in best town on Georgian Bay. Rare opportunity for live man. Box 186, Canada Lumberman, Toronto. 9-10

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

### Sales Agents Wanted

Large U. S. firm making steel and wire prodncts wants sales agents in both Eastern and Western Canada. Lines include metal wheels and axles, farm wagons, tractor trucks, log and freight wagons, portable mountings for machinery, etc. Box 198, Canada Lumberman, Toronto. 9-10

### Lumber Business

For sale in Eastern Canada, a first-class lumber business in good running order, comprising over 200,000 acres license lands, sawmill with excellent loading facilities by deep water wharf. Principals or their soliritors only. Address Veray, Canada Lumberman, Toronto. 9-10

### WANTED

Salesmen selling supplies to Lumbermen and Contractors to handle as a side line Dr. J. M. Stewart's Veterinary Remedies, now being used by the greater number of Lumber Companies in Canada. Liberal commission.

PALMER MEDICAL CO., LTD.,
7-t.f. Windsor, Ont.

### FOR SALE

The Lumber Yard of the Estate of D. Dupuis, situated on St. James Street, Hull.

The property comprises a valuable block of land, having frontages of 254 feet on St. James Street, 221 feet on Leduc Street, 142 feet on Wellington Street, and 210 feet deep between St. James and Leduc Streets.

The yards are stocked with a large quantity of valuable lumber of all kinds.

The business is a good going concern, having a large trade, and was established in 1890. It can be purchased en bloc, or the lumber and rolling stock can be bought separately and the land rented.

The property is a valuable building site, suitable for subdivision into city lots, and is situated right in the heart of the business section of the city.

For particulars apply to P. H. Charron, 142 Champlain Ave., Hull. 7-10

## Miscellaneous

### Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

### For Sale

Copies of "The Preservation of Structural Timber," by Howard F. Weiss. Published in 1915 by McGraw-Hill Book Company. 312 pages, illustrated. Price $3.00. Canada Lumberman, 347 Adelaide Street West, Toronto.

### Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

## Why Belts Jump

Uncle Felix asks for some information in regard to a belt jumping, and whilst the data he gives are not very complete, yet I think I can possibly help him somewhat.

The immediate cause must be an irregular motion of the engine; that is, a change in the velocity during each half revolution. This may arise from one of two causes, to wit: a fly-wheel too light for the duty it is called on to perform, or a faulty setting of the slide-valve. Under such circumstances the speed of the engine will vary during each stroke of the piston, being at its greatest speed when the steam is exerting its greatest force on the crankpin, which will be, if the valve is properly set, when the crank is at an angle from 45 to 90 degrees in the first quarter of the revolution, the speed then falling slightly till the semi-revolution is nearly complete, when it rises again from a repetition of the cause. At these points of high speed the belt, being subject to a heavier strain, is slightly stretched, and released; these alternations of strain and release being repeated at regular intervals, are what cause the jumping complained of.

With regard to the swaying being greater at a speed of 145 revolutions than at 175 can be readily accounted for. A belt or cord under strain has a certain and invariable speed of vibration, dependent on the strain it is subject to, and the distance between the supports. Now suppose the time of vibration of the belt under discussion is 145 or 290 times a minute; in either case the impulses it will receive from the engine will keep time with its motions, and therefore will increase the same to the utmost limit. When, however, the engine is running at 175 revolutions, the impulses given to the belt by the irregular motion of the engine would not keep time with the swaying motion of the belt, and therefore, instead of increasing these motions, would interfere with and reduce them.

As an example of this result, I

remember well being on the forecastle of a large armor-clad ship on her trial trip. She was about as rigid as a ship could be made, but with the engines going at half speed the vibration was so great as to almost lift one off his feet; but when the speed of the engines was slightly increased the vibrations entirely stopped. At half speed the motion of the engines was keeping time with those of the ship, whilst the faster speed were not doing so, and in consequence destroyed by interference the ship's vibrations.

It is possible that the slide-valve of the engine in this case is not properly set. This is sometimes the case in stock engines. I have also heard of such a thing as an engineer, on leaving a place, do such a thing as to purposely destroy the setting of the valve, thinking to make trouble for his successor; in either case, this might account for an irregular motion of the engine, and, through that, for the swaying of the belt. If the cylinder is piped for an indicator, the best thing to do would be to get an indicator and take some cards; these would show exactly what is going on inside the cylinder, if there is a defective valve setting, and last, but not least, if you are getting good service from steam supplied to the engine.

If it is not possible to apply an indicator, the best thing to do would be to open the valve-chest and see to the setting of the valve. Any competent engineer could tell if any adjustment was necessary, and do what was required to regulate the working of the engine. I judge from what he says that the engine is an ordinary slide-valve style, not an automatic cut-off; in the latter case the adjustment of the valve is much more complicated, and would require the services of some one experienced in that type of engine.—Chas. A. H., in The Woodworker.

### Determining Tree Volume

Henry S. Graves, chief forester of the United States Forest Service, recently delivered an address before the Washington Academy of Science on the place of forestry among the natural sciences. His paper was very largely a brief statement of the scientific position of forestry, covering, therefore, well trodden ground. There was, however, one statement in the paper which does not appear as yet to have been given general circulation:

The common practice of determining the contents of trees either in board measure or in cubic feet is to measure a large number of trees of a given species in a given locality and apply the average figures to the trees of the same diameters and heights within that locality. Since there are, however, a great many species of trees in this country some of which have a very wide geographic range, this method necessarily involves the preparation of a large number of local volume tables and hence the measurement of hundreds of thousands of trees. The measurement of the taper of a large number of trees has shown that there are certain critical points along the stem of a tree the ratio between which expresses the form of the tree in a sufficiently accurate manner. It was found that trees having the same total height, the same diameter breast-high (4½ feet from the ground), and the same ratio between the diamter at half the height of the tree and the diameter breast-high, must invariably have the same cubic contents irrespective of the species of the trees or the region in which it grows. Thus whether it be a Scotch pine of northern Sweden, a yellow pine of Arizona, a mahogany of the tropics, or a scrubby birch of the Arctic Circle, the volume of the tree may be expressed by means of one simple relationship. The discovery of this very simple relation provides for the first time a basis for the construction of a universal volume table. The mathematician of the earlier period sought in vain to find a formula by which the cubic contents of a tree could be expressed. What the mathematician failed to develop by the deductive method, foresters have found by the inductive method. With a reliable table for converting cubic measure into board measure for trees of different sizes the universal volume table expressed in cubic feet could be translated into a universal table expressed in board feet, which is the measure peculiar to this country.

### Wrinkles in Wood Structure

Little diagonal streaks or wrinkles across the grain of a piece of timber not only betray weakness, but sometimes indicate periods of stress through which the wood passed when it was growing. They may even be taken as a sort of check on the official record of windstorms. The marks are then caused by what are called "compressed failures," which occur when the fibres bend or buckle under a too heavy strain.

In cutting up logs collected for experiments at the Forest Service Laboratory at Madison, Wis., it was noticed that these compression failures appeared on the north side of a number of trees which came from the same locality in Florida. By counting the annual rings of the wood, and from knowledge of the time when it was cut in the forest, it was decided that the compression failures must have been caused by a severe wind from the south about the year 1898. Inquiries were made in Florida and it was found that a hurricane had, in fact, swept over the region at that time.

Experiments show that the strength of a piece of wood may be seriously impaired by slight compression failures due to rough handling. Dropping a beam across a skid may cause a compression failure at the point where the beam strikes the skid, and it will be at this point that the beam gives way when it breaks under a strain too severe for the weakened fibres to withstand. Hitherto unaccountable breakage in hickory wagon-spokes and other presumably strong material are now attributed to compression failures caused by windstorms in the period of growth or by hard usage.

### Variable Speeds on a Sander

Very little is said about the advantage of having a sander with variable speeds of feed, but I want to call your attention to the fact that there is hardly a manufacturing plant that has any use for a sander, all of whose stock requires the same finish, says a correspondent of Berlin Quality. Some of it requires the very careful finish that is obtainable only with a slow feed, while a considerable part of it may be finished at much faster feeds. It is certainly a waste of time to sand all this stock at the same feed, so it is very desirable that the sander operator be able to vary his feeds with the class of stock upon which he is working, without having to change gears of pulleys.

It has been my experience in working in factories, where different makes of sanders were installed, that the operator of the machines requiring a change of pulleys or gears in order to change feeds, generally sands everything at the same speed; while the man who has a machine with feeds quickly changeable always takes advantage of them. It seems to me that this is a point very often overlooked by buyers of sanders; and as a practical man, I want to call their attention to their loss of time and money in not paying more attention to the matter.

It is possible with the machine I work with to save at least a third of the time spent in sanding by setting the speed of the sander according to the class of finish I am expected to secure. This not only amounts to considerable money in the course of a year, but the sanding here is never the point of delay in getting stock through the factory. We believe here that this feature alone has saved us the interest on the machine investment. Others would probably save that much or more.

### Gas From Wood-Waste

Writing from 47 Victoria Street, Westminster, London, England, E. Smith, in the Times Engineering Supplement, draws attention to the neglect of the utilization of wood-waste. He states that leaves, loppings, roots, chips and sawdust, and any kind of combustible refuse, will make gas for working gas-engines and supplying retorts and furnaces. Usually 2½ to 3 pounds of such refuse will develop 1 brake horse-power, which means that a ton will supply 100 brake horsepower a day.

Sawdust and wood-waste show good financial results when used for distillation purposes, and it also pays to use sawdust for the manufacture of oxalic acid, which at the present time commands a high price. He finds that the distillation of one ton of waste wood (common soft woods) yields 15 gallons of boiled tar, 4 gallons of wood oils, 6 hundred weight of charcoal, 5 gallons of wood-naphtha, and 1¼ hundredweight of acetate of lime.

### Heavy Inquiry for B. C. Lumber

It is currently reported that tenders have been asked by the French Government for about 250,000 standards of British Columbian wood, to be used in constructing 100,000 two-roomed houses in France. These houses are to be built at the expense of the Government for the use of people who have lost their houses and other property owing to the war. If British Columbia is successful in securing this order, the mills there would be kept busily employed for some time, but in view of the reported removal of the embargo on Swedish wood, the position is now somewhat altered, as it becomes more a matter of price instead of, as previously, being one of inability to secure adequate quantities of Baltic goods. For the latter, however, with restrictions removed, there will be a more than ample demand so soon as the actual situation is disclosed, but as yet there is no official declaration on the subject, unless the War Insurance Committee's readiness to accept risks is considered to be an equivalent.—Timber.

Railroad location and construction. Roads and Rivers improvements. Good information concerning Quebec Timber and Mining lands, cheerfully given.

# Review of Current Trade Conditions

### Ontario

During the past fortnight there has been a lull in the activity of the lumber trade throughout Ontario. Travellers who have covered the province report that the past fortnight has been the quietest period they have experienced since the beginning of the year. The only lines in which there is any activity worthy of notice are spruce and lath. Spruce continues strong on account of the fact that very little of this class of wood is being sent into Ontario from the east. Practically all of the spruce deals produced in the Maritime Provinces have been contracted for to be exported to Great Britain, and the small amount that is coming to Ontario is held at good prices. Owners are not finding any trouble in selling spruce in desirable lengths. Stocks of lath are scarce and prices continue strong. Owners of lath are also able to sell their holdings readily.

The only places where travellers during the past two weeks have reported any activity are in the small towns dependent upon the farmers for the demand. The larger towns and manufacturing centres are very quiet. In the small towns even, the amount of trade is limited. Generally it has been going to the man who was fortunate enough to be on the spot when the stock was needed. No change of any importance is reported in connection with the hardwood trade. Prices continue steady, but the actual volume of trade is light.

### Eastern Canada

Reports from Montreal indicate that there is a fair volume of trade but that it cannot by any means be described as good. The most encouraging situation is that in connection with the demand from the United States, where Montreal firms have recently found a good demand. Orders aggregating 2,500,000 feet of spruce have been received by one Montreal firm for shipment to the United States during the past six weeks. Prices of spruce are firm, having been influenced by the good demand from the United Kingdom. Quite a number of Montreal factories have been kept busy on orders for ammunition boxes. This is using up considerable quantities of stock. The trade in sash and doors, however, shows a falling off. In connection with the export trade there is a good demand, but the difficulty in securing space for shipments continues and makes the trade quite uncertain. Recent freight rates are about 100s. per standard for Liverpool and 120s. for Glasgow. Sales of stock for shipment to Great Britain have been extensive and it is greatly to be hoped that more vessels will be available as the season advances. The outlook in connection with the market for ground wood is better. Enquiries from United States mills are commencing to appear. Prices are being well maintained.

A slightly easier tone is reported in the eastern spruce market at Boston, on account largely of the fact that more mills are now sawing than a short time ago. Most manufacturers are still quoting $24.50 to $25 less commission to the wholesale trade for railroad shipments of frames 8-in. and under, but good retail buyers are getting their stocks at $24 to $24.50, Boston rate. It is generally thought, however, that this is only a temporary easing off and that within another month spruce will be firm at a $25 base. The demand for random spruce is improving. The hemlock trade at Boston continues slow. Very little hemlock dimension is moving. Most manufacturers are holding their stocks in the expectation of better prices in the near future.

### United States

There has been a fairly general, although slight improvement in the lumber business in the United States during the past fortnight. The demand has shown some expansion and prices are possibly a shade firmer. Strength has been contributed by a better demand for building purposes, for car and railroad material and for wood consuming manufacturers. It is reported that freight shipments and passenger travel on the railroads have both increased during the past fortnight. There is a splendid outlook for the winter wheat crop which is also helping the general business situation. In many of the larger cities the opening of spring has improved the demand for building materials. Improvement is reported in connection with yellow pine. Prices are fairly steady with a good demand for nearly all sizes and grades.

In the northern pine trade some improvement is reported, although the retail trade has not reached its regular spring volume. There is a better factory demand at Minneapolis and it is reported that there is plenty of trade in sight for the country yards. Prices are holding firm. Conditions are improving in the Saginaw Valley. A little improvement is reported in the hemlock trade which is said to be feeling the benefit of the spring building activity. Prices are steady and it is reported that stocks at producing points are reduced. A number of manufacturers are coming to the conclusion that a good season for hemlock may be expected. This opinion is heard frequently in Wisconsin and Pennsylvania.

Gradual, but slow improvement is reported in the hardwood trade. Much caution is still displayed, however, in purchasing ahead of current requirements. The price situation is showing signs of firmness. Plain and quartered oak in both red and white are in fair demand. There is a steady improvement in ash and hickory. In the northern trade the situation is better than it has been for several months, as manufacturers curtailed extensively during the past logging season.

### Great Britain

The London market has not been quite so active during the past fortnight, although deliveries at the docks continue to show increases over those of last year. Forward purchases are reported from all the usual sources of supply. There seems to be no prospect of any weakening in present values as the spot stock at London is light and there is little likelihood of new goods coming in at much of a reduction. Buyers, however, are adopting a waiting policy, which is nothing to be surprised about. They will just purchase what they need and pay the current price. Deliveries at London docks during the week ending April 17th amounted to 3,659 standards as compared with 2,239 standards during the corresponding week of last year. At Foy Morgan & Company's recent auction sale 3 x 11 second Montreal "yellow pine" sold at £29 and shorter lengths at £28 5s.

There is no alteration to report in the general trade situation at Liverpool. The demand is still spotty. Importations of spruce deals from New Brunswick and Nova Scotia have been "sold to arrive" to the usual importers. These goods are being despatched up country as rapidly as the railroads can handle them. Prices on deals from St. John and Halifax "to arrive" are unchanged. The uncertainty of tonnage makes it very difficult to complete contracts for future delivery. No change is reported in the market for Canadian pine deals. Most of the stocks on hand at Liverpool are held by the two leading houses in this branch of the trade who are selling them only when they can secure good prices, because they could not replace them at what they cost, for next season. Owing to the scarcity of large sized pitch pine logs, the spot stocks of Columbian pine have been greatly reduced of late. Fresh arrivals of Columbian pine are costing more money than existing stocks have been sold for.

The trade at Manchester is rather quiet, partly on account of high prices and partly on account of high freight rates. Spruce deals are going forward, but the prices are very high. Birch continues strong. Holders of dry birch boards and logs have raised their prices considerably. Birch logs are now valued at 21d. over the inch, thus 17-in. wood is worth 3s. 2d. per cubic foot. Similar quality was sold not many years ago in 17-in. logs at 1s. 5d. per cubic foot. The difference is largely the effect of the freight rate of 160s. per standard to Manchester. Dry birch is valued at 5s. per cubic foot. Pine deals and boards are also firm. Third quality Quebec deals 11 in. x 3 in., are valued at £15 per standard with 4ths at £12 f.o.b. Montreal.

Reports from Glasgow state that the opening of the Montreal shipping season should find a good market for pine deals as very heavy selling is reported recently on the part of a few merchants holding good stocks. The deals are wanted for immediate consumption.

---

The University of Wisconsin extension division announces a correspondence-study course on the subject of lumber and its uses. The course has been prepared by one of the best authorities in the country and is planned especially for lumber dealers, contractors, carpenters, salesmen and others whose work relates to nature's great building materials. Topics included in the course will deal with the structure of wood, paints and stains, physical properties, standard grades and sizes, structural timbers, seasoning and preservation, lumber prices, cost of wood construction, specific uses of wood and the selection of materials.

While lumber is one of our most important natural resources, and one which requires more special information in its use than probably any other material, yet there has been available, in form of systematic instruction, less information on this subject than on any other material of anywhere near equal importance. But little effort has been put forth to save those who deal with the use of wood from acquiring their information by the slow, and ofttimes bitter, lessons of experience.

View of Mills in Sarnia.

# BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

### Ottawa Trade Fairly Active

Ottawa, May 7; (Special to the Canada Lumberman-:—All the sawmills in the Ottawa Valley are now operating. Though the water in the Ottawa and its tributaries is not as high as the average at this time of the year, compared with other years, excepting last year, there is enough to keep the logs on the move. It was reported that the water was so low in the Coulougne and Gatineau Rivers that big drives of logs were held up. This report, however, is denied. Given an average rainfall during the summer months local lumbermen say that they are not likely to be so badly handicapped by lack of water as they were last year, which was a record dry season.

In spite of all the conditions that are militating against business conditions arising out of the war, trade in this district is not so bad; in fact it is fairly good, taking everything into consideration. The export business is, of course, confronted with much difficulty, due to the presence of so few boats in the Trans-Atlantic trade compared with the number in times of peace, and the dangers attendant on shipping, from German submarines and mines near and in British waters. Most of the boats that were formerly in the Canadian service are now under the control of the Admiralty and the boats that are not, are required for the transportation of war materials and troops from Canada.

The sash and door factory of the Pembroke Lumber Company was completely destroyed by fire in the early hours of Tuesday morning last. The loss is estimated at $75,000, which is covered by insurance. It has not yet been definitely determined what was the cause of the fire.

Local building is likely to be handicapped by a strike of the bricklayers and masons. Their agreement with their employers expired on April 30th.

The will of the late Captain John L. Murphy, well known to lumbermen throughout the Ottawa district, who died in Riverside, California, about one month ago, was filed for probate here this week. He left an estate valued at $329,984. Of this amount $261,753 was in bank stocks, $36,010 in bonds and debentures; real estate in Ottawa and California, $29,600, and the balance in other miscellaneous assets. He left $2,000 to St. Patrick's Orphan Asylum, Ottawa, and the rest of the estate to his widow and several relatives.

Lumbermen will be affected by the reversed decision of the Dominion Government respecting the war stamps on American and other foreign cheques, drafts, bills of exchange, etc., issued outside of Canada and payable in this country. The government at first ruled that such bank paper need not have a war tax stamp attached when presented for payment, but has just reversed that ruling.

### Quiet Trade at Montreal

Montreal, May 8th (Special to the Canada Lumberman):—Conditions in the lumber market have not undergone any marked change. Business cannot be described as good, but at the same time there is a fair volume of orders. The one bright spot is the trade with the United States, some excellent business having recently been placed with local firms. Within the last six weeks one firm has received orders aggregating over two and a half million feet of spruce. Prices are being maintained at a satisfactory level, and heavy sales of spruce for United Kingdom having a material influence in this direction. The prices obtained for this description of lumber were higher than last season, and in turn this has tended to strengthen the local market.

Orders for ammunition boxes continue to be placed here, and are keeping some of the factories very busy. The business in sash and doors has slackened. Building permits for last month were unexpectedly large, but again show a decline as compared with those of last year. They were valued at $975,891, a falling off of $1,230,079. For the four months the total was $1,865,827, or a decrease of $2,195,336.

The export season has not commenced very auspiciously. Only a small amount of lumber has been shipped, owing to the scarcity of space. The steamship companies now decline to book space ahead, and shippers have to take whatever room they can secure. The space available is a very uncertain quantity, while prices rule high, with an upward tendency. About 100s. per standard for Liverpool and 120s. for Glasgow have been paid. There is a probability that as the season advances more vessels will be put on, but the sales for the other side have been very heavy, and shippers are anxious to obtain every inch of room they can get.

A correspondent at Three Rivers reports that the St. Maurice River has risen considerably, and that log driving has been greatly facilitated by recent rains.

All indications point to a better demand for ground wood in the immediate future. The stream on which are situated American ground wood mills have now reached a point where they will commence to recede, and already there are inquiries as to contracts with Canadian mills. The latter could easily handle more orders, but there is no disposition to reduce prices in order to dispose of present stocks.

The imports of sulphite from Europe into the United States have materially decreased of late, and with the present compartively small stock, the outlook is for higher quotations.

### North Shore Drives Needing Rain

Thessalon, Ont., May 7th; (Special to the Canada Lumberman-:—This spring, so far, has been the most unfavorable for driving in the history of Algoma. The snow went away gradually and we have had no rains so far, although, notwithstanding the low water the drives have made good progress. Unless we get considerable rains from this out, however, the drives on the upper waters will not come out this season. This will be a serious loss, not only to the lumbermen, but also to the different towns along the shore which are dependent upon the mills for their existence. However, the season is still young and we may have a great deal of moisture yet this month. River drivers are very plentiful this spring, and wages on the rivers are not quite so high as formerly. Today has every appearance of rain and should we have a wet turn for a few weeks everything will come out, as the lumbermen have a good organization, with large crews of drivers on the ground, and are well equipped with alligators and everything necessary, when the rain comes, to take advantage of whatever may be to their benefit.

### Barbados Market Report

S. P. Musson, Son & Company, Barbados, report under date of April 17th, as follows:—Lumberstuffs.—White Pine—There have been no arrivals during the fortnight, and there is no enquiry at the moment for Merchantable quality, but receipts of good Second quality would do well. Spruce—No arrivals to report. The market is very heavily stocked, and there is absolutely no enquiry for either Shippers or Seconds. Shingles—Dealers are supplied, and stocks of all descriptions are ample for present requirements. Shooks—No receipts. Wood Hoope—We note the arrival of 500 bdls. by Steamer from London for dealer's account.

### Annual Meeting of the Joseph Dixon Crucible Company

The Annual Meeting of the Stockholders of the Joseph Dixon Crucible Company, was held at the company's office in Jersey City on April 19th, 1915. A large number of stockholders were present who expressed their satisfaction with the present management and re-elected the former Board of Directors for the ensuing year. The vote recorded was the largest ever represented at an annual election—19,519 shares out of a possible 20,000.

The following are the Directors elected: George T. Smith, Robert E. Jennings, George E. Long, E. L. Young, William G. Bumsted, J. H. Schermerhorn, Harry Dailey. The officers elected by the Board of Directors are: President, George T. Smith; Vice-President, George E. Long; Treasurer, J. H. Schermerhorn; Secretary, Harry Dailey; Asst. Secretary and Asst. Treasurer, Albert Norris.

### Machinery Firm Reports Good Business

Messrs. P. Payette & Company, of Penetanguishene, Ont., manufacturers of saw mill machinery, report business as having been exceptionally good the last couple of months. They have been keeping their factory running on full time all along to keep up with their orders. A number of installations have been put in by the firm this spring, among them being a new steel carriage of 44 inch opening at Manley Chew's mills at Midland, equipped with Payette's Frictional Grip Set Works, and patent mill dogs; a Payette lath mill and bolter in Graves Bigwood & Company's mill at Byng Inlet; a lath mill and bolter in Foley Bros.' mill at Scott, Ark., and two lath machines for the new Spanish Mills Company's mill at Cutler, Ont.

B. Gonnason, of the Leman Gonnason Lumber Company, Victoria, B.C., was recently in California.

# Getting Acquainted

Is somewhat of a problem, at times, occasionally decidedly unpleasant You have probably found it so in both your buying and selling experience.

Why take a chance of having your pride, feelings or temper ruffled—stick close to your old friends, not quite the excitement may-be, but there's that peace of mind, that satisfaction in knowing that they can be depended upon.

There is no more dependable place on earth to get your Dressed Spruce, than Fenderson's—the value is in it—beautifully dressed—excellent grade—bone dry—you can bank on its being good when you place the order.

If you would help your business grow, handle better stock than the other fellow, your customers talk it over, if pleased, they build your business—if not pleased, they tear it down. Be jealously careful of your strongest advertising medium.

## Remember

The most value for every dollar.

Each car chuck full of satisfaction.

Make that next car a Fenderson car.

You'll like it.

# Fancy Woods and Veneers

THEIR ORIGIN, VALUE AND USE—COMMENT AND VIEWS ON AN IMPORTANT BRANCH OF THE TRADE.

## Proper Finishes for Walnut

Manufacturers of furniture who are putting out designs in American walnut are studying closely the trend of fashion with reference to the character of finish to be applied. In fact, one of the main features of the recent furniture shows was the attention given by the furniture concerns to the desire of buyers in this respect, and to the difference between the finish used in their own factories and in those of their competitors.

It seems that the consensus of opinion on the part of both manufacturers and dealers is in favour of dark-brown. Light-brown was shown to some extent, but did not seem to get the attention of the buyers. And while there were a few concerns which seemed to have gone out of their way in an effort to find some unusual method of finishing American walnut, putting it out in a grey cast, which was certainly not characteristic, no matter how attractive it might have been considered, this treatment was the exception and not the rule.

The thing which manufacturers who are using walnut should remember in this connection is that people who are going into the retail stores and buying American walnut furniture are being guided largely by their recollections of the furniture which was in vogue twenty-five or thirty years ago. Of course, they expect to see the monstrosities of that period, as far as design is concerned, replaced by the chaste design which have now been brought out by the manufacturers; and instead of seeing a finish which distorted the beauty of the wood, and was heavy and shiny, they have been taught to look for the dull, soft finishes which have been characteristic of good furniture for a number of years.

But as far as colour is concerned, they are looking for browns. American walnut is being exploited as a brown wood, and it is brown, wear and use bringing out this shade to a greater extent than might be thought, looking at the wood fresh-cut. Consequently, the manufacturer who finishes it brown is simply following the natural tendencies, and is also following the line of least resistance. He is finishing his furniture the way the public expects it to be finished, which means the way it is going to sell most readily.

As pointed out above, some manufacturers seem to have attempted to make a garish display of walnut, by finishing it in such a way as to develop contrasts of figure, and developing yellowish tones which suggest figured gum or Circassian walnut. These effects may please some people, but they are not characteristic of American walnut, and do not seem to have much claim on the sentiment or fancy of a public which is associating the product of to-day with the usages of the nineteenth century.

Walnut consumers should study the question of finish very closely, because this will affect the success of their lines more than they may have thought.—"Veneers."

## The Prospect of Walnut Supply

The prominence which black walnut has lately attained has caused inquiries concerning supplies to meet present and future demand. There has not yet been any trouble in meeting demand as it has come; but persons who expect the call for this wood to increase in the future have been looking ahead to discover whether a larger demand could be met.

No one knows just how much standing walnut of merchantable size and grade there is in the United States. It is certain that this tree is much scarcer than it once was, though it is not certain that it is becoming scarcer from year to year, but such is probably the case. The tree is not marketable until it has attained considerable age, because its value lies in heartwood and this is poorly developed in trunks which have not a good many years to their credit. For that reason young walnuts of rapid growth are not an immediate asset, though size may be satisfactory.

Black walnut's natural range embraces not less than 600,000 square miles, from New York to Texas. The annual drain upon it is usually placed at 50,000,000 feet, including lumber, veneer, and export stuff; but it is difficult to show this by itemized figures, because it cannot be ascertained how much walnut is counted twice in reaching the fifty million total. The Forest Service was able to find only 23,988,346 feet of black walnut a year used for manufacturing purposes in the United States. This included veneer as well as lumber, but did not include any lumber used in its rough form. It is certain that not much is used as rough lumber.

Black walnut was once an absolutely wild tree, confined wholly to forests, but its habits underwent a modification as the country became settled. It was one of a few trees which showed a disposition to become domesticated. As fields replaced woods, the walnut became more and more conspicuous in the open ground, along fence rows; in the corners of pastures, and even in door yards. Some were wild trees left standing when the thickets were cleared, others were planted on purpose or by chance. The nuts which the tree bears have always been esteemed, and have been the saving grace in many instances which preserved it when forest associates of other species were destroyed.

A radical change in rate of growth occurs when the black walnut emerges from forest conditions and takes its place in open ground. When shaded and crowded, its rate is slow, and forest-grown trunks of large size are usually very old; but in the full light of open ground, where the roots are permitted to spread freely through good soil, the growth is rapid and trunks quickly increase to large size.

During early life, however, the tree in the open does not increase in value proportionately as it grows in diameter, because heartwood forms slowly, and the "sudden sawlog" of black walnut is apt to be principally sapwood which, on account of its white color, is not valued highly by the woodworking factory. Years are required to change the sapwood into heart, and when the transformation has finally occurred, the pasture field walnut is as valuable as that grown in the wilderness, except that it may be shorter of trunk, and that may be compensated for by more desirable figure.

Apparently no statistics are available which give the quantity of plasted black walnut now growing in this country. The acreage is considerable and is dispersed through several states, some of which are not included in this tree's natural habitat. In California, for example, the tree grows rapidly in situations where the soil is sufficiently damp; but the nuts are so valuable, and the trees produce such abundant crops, that no one cuts the groves for lumber, and the grain, color, and figure of the wood have not been described in reports.

As the walnut becomes more domestic and less a product of the wild forest, it is not improbable that the desire to save it for its nuts will become a powerful factor in reducing the supply of walnut lumber. The fruit will be worth more than the saw-logs which may be cut from the trunk. Apparently, age sets no limit on the productiveness of the walnut tree. Of course, a time comes in the existence of all trees when they must cease their activities; and at that period the domestic black walnut may be expected to go to the sawmill. It should not be expected, however, that young walnut trees, with little heart and much sap, will be cut in large quantities, because it will not be profitable to do so. The black walnut is a tree which depends largely upon age for the value of its wood. Rapidity of growth, though in itself a desirable asset, cannot wholly take the place of the value due to age.—Hardwood Record.

## Where Veneers Are Used

The relative quantities of veneer used by various industries are not shown in available statistics. The total annual production of all thickness in the United States is known, and the various thicknesses are segregated in a way to determine how much of each is produced. The amounts cut from various woods are tabulated, and there are separate figures for rotary cut, and sliced, and sawed. Beyond these points the records do not go.

The person who undertakes to state how much veneer goes to this industry or to that must indulge in guessing, but it is possible to secure much information so that the guesses may be brought within the range of probabilities. It is very commonly believed that furniture manufacturers are the largest users of veneers, and after that, according to popular opinion, come the musical instrument makers and the industry known as fixtures. The most common articles grouped in the fixture industry are store and bank counters, office partitions, and saloon bars. The total annual demand for wood in making furniture, including chairs, totals 1,250,000,000 feet, board measure, in the United States. Musical instruments call for 260,000,000 feet, and fixtures account for 187,000,000 feet. In making the articles included in the foregoing classes, there is no fixed ratio between the use of lumber and of veneer. It is certain that veneer lacks much of constituting one-fourth of all wood reported for these three industries, but it is not possible to quote exact figures to show it.

There is little question that those who have given credit to furniture, fixtures, and musical instruments for the largest use of wood veneer, have overlooked the most important of all—the box. The combined use of wood by makers of musical instruments, fixtures, and furniture scarcely amounts to one-third of the demand by box makers. In the manufacture of shipping boxes, veneer is employed

# TEAS FOR CAMP

The tea market has been soaring during the past few months and prices have got quite high—we have a good stock on hand and can give you your requirements at very little over the old rates. You will surely be interested in our offerings—just drop us a card asking for samples of our teas suitable for Camp.

## "The Conveyor Chain Broke"

These few words tell the reason why of many a costly shut down and the consequent loss. The reason can almost always be traced to inferior chain—that cost a few cents less.

**"STANDARD" CONVEYOR CHAIN**

***is your insurance against failure.***

Specify it on your orders and be sure you get it.

**Standard Chain Company, - - - Pittsburgh**

in large quantities. Some of the small shipping containers which are made in enormous numbers, are wholly veneer, while many large shipping cases have veneer sides, tops, and bottoms, with reinforced corners. In boxes of that kind, the veneer is usually three ply. The wire-bound box, which is principally of veneer, is in much use.

Just how thick a sheet of wood must be to pass out of the veneer class and become lumber, may be subject of controversy. When the government compiles statistics it classes as veneer all lumber five-sixteenths of an inch in thickness and under. More veneer is of three-sixteenths inch thickness than of any other dimension, if all be reduced to a board-foot or a log measurement. About one-fifth of all veneer cut in the United States is of that thickness. If calculated by superficial measure, veneer one-sixteenth inch thick exceeds every other dimension.—Hardwood Record.

## Filing Band Saws for Hardwoods

There is just as much difference in filing band saws for mixed hardwoods and for soft woods as there is between night and day. The outputs of a day's sawing of hardwood and of soft woods are so divergent as to quantity as to be scarcely believable to one without experience in that line. When a mill equipped with a band and re-saw has sawed for five or six years in soft wood and then is run on hardwoods for three or four years, and on about a dozen different kinds every day, it is possible to begin to judge the difference in the outputs of the two types of wood. A band saw filer will then fully realize how much more difficult his work is and will be confronted with the fact that the output of a day's cut is anywhere from twenty-five to thirty per cent. less in hardwood than in soft wood.

Comparing saw practice or fitting in soft wood with that of hardwood a radical difference will be found in the fitting, the shape of the teeth and the bench work, and the mill must be in perfect condition to get the best results. Suppose a mill saws hemlock or spruce; all the equipment is supposed to be in proper order, but yet the finer points are not as essential to get good results as when sawing hardwoods. Mills that cut hemlock and spruce are sawing material that is used mostly in the rough. If it is a little snaky or if some pieces are not just the standard thickness, they will go on the market just the same, but in hardwood it is a different proposition altogether. In that case stock is cut for furniture factories and all kinds of fine woodworking establishments, and in every case the demand calls for perfectly sawed lumber. A furniture factory can come nearer making a No. 1 cut of a No. 2 common than it can to making a crooked board straight. It is not only that that decreases the cut of a hardwood mill, it is the getting the best out of logs that keeps hardwood lumbermen in business, and when good sawyers make good grades, logs must be handled three or four times more than when sawing soft wood, so it can easily be seen why the cut falls off so much changing from soft wood to hardwood. The question might be asked "if the cut decreases so much why is the filing of the saws more difficult?" That is the result of handling many different kinds of wood. Most hardwood mills cut red and white oak, sugar and soft maple, chestnut, basswood, poplar, cucumber, buckeye, birch, beech, and ash with a small per cent. of wild cherry which makes thirteen—surely enough to make a filer sometimes think it is an unlucky number. The difficult thing is to so fit a saw that it will stand up to the requirements of so many grains and degrees of hardness and do equally good work in each. I believe that basswood should be sawed by itself because it is almost impossible to saw if mixed with sugar maple, ash or oak, owing to its fibrous nature which requires more swage on saws.

As I have said before, in the fitting of saws for hardwood there are several essentials to first class work, as follows: The right hook and pitch of teeth, the right throat room, the right tension, the right fitting of cutting points, the absolute accuracy of the back, the proper condition and speed of the mill, and more important, the proper swage. When a mill starts to saw hardwood it should be repaired thoroughly; all gearings and bearings should work snug. Especially is it necessary to have the band wheels ground more frequently than in soft wood as more or less dust gets on the wheels, the logs are more gritty, the wood is much harder, causing more strain on the saws and naturally the edges of the wheels wear much sooner. The carriage should be kept in first class condition. Should it have a little play, seemingly not enough to hurt in soft wood, or should the set works have a little lost motion—even 1/32 of an inch—it will cause lots of trouble sawing high-grade hardwood. The carriage track requires more attention, the tremendous weight of sugar maple, ash or oak falling on the head blocks while handling the logs so much oftener with the nigger, causes it to get out of level and out of line so much more quickly. Another very noticeable defect often found is that in cutting the last cut of a log the board dogs are not in good enough holding and working order to prevent the two or four inch cast from springing. As a result there are often dozens of thick or thin boards in a day's cut.

The speed of the mill very frequently has much to do in making crooked lumber. Some millmen think if they speed a mill up like lightning it ought to go through the cut of a log like lightning. A mill with a speed of ten or eleven thousand feet per minute in soft wood does the work nicely, but to try that speed in hardwood without changing the spacing of the teeth in the saws means so many miscuts in a day and so many saws that the mill could not be run successfully. About eight or nine thousand feet is the best speed. With speed conditions satisfactory and a good sawyer the mill will do up-to-date work provided the saws are put up in good shape.

When fitting saws for hardwood it is very important to give the teeth more attention. A little less hook should be carried. If the filer is accustomed to extreme hook in soft wood it should be about one-fifth less in hardwood. By pitch I mean back of teeth—they should be lowered so as to have more clearance on back of teeth in sawing some hardwoods. Pitch is liable to gather on a high back tooth and cause it to snake. The depth of the tooth should be full 5/8 of an inch in frozen timber and about 1/16 more when the timber is not frozen. A nice round throat such as common sense dictates is very essential to assist in throwing the sawdust out easily.

The bench work on the saw requires the finest kind of work in hardwood or else "bull heads" and "snaky" lumber will result. It is necessary to look over the saws every day. Hardwood sawing requires more tension along the edges of the blade and it seems impossible to level them too much. All small lumps should be removed because the more level a saw is the smaller a swage can be run and the less chance of the saw getting hot. The back of the saw must be kept in such a condition that it fits the back gauge the whole length of saw without any variations whatever. Too much oscillating is not beneficial to saws in any kind of wood as it seems to throw them out of balance, especially as they enter the cut on large logs. A saw that oscillates also has a tendency to cause band wheel boxes to run warm. It is a good idea to run the back of the saw with a crown of about 1/64 or 1/32 of an inch in five feet. That makes the tooth edge the tightest. When the strain is on the saw in hardwood, very often the tooth edge gets warm, in which case the steel expands and if the saw is run without a crown or with a straight back, it makes the tooth edge the longest and therefore not tight on the cutting edge. The result is the saw snakes very easily.

The most important question is the amount of swage a filer runs on his saws. If an estimate could be made of the amount of timber that is cut into sawdust by excessive swaging, it would be astonishing. However, I believe most filers are trying to do justice in that respect. In some cases millmen are constantly causing trouble and making bad lumber by forcing their filers to run saws with not sufficient swage; but filing saws in hardwood in clean logs on a seven and eight gauge swage on fourteen saws is entirely too much. Some filers swage a saw every three or four runs. Of course, that saves work but not lumber. The best and most economical plan is to swage light and often—to make lumber—not sawdust. It requires a few more emery wheels and is a little harder on filing room machinery but the cost of that is small compared to the amount of lumber saved. In sawing gritty logs a nine gauge light is plenty of swage. If the logs are clean nine gauge tight is sufficient. If all these things are adhered to a sawmill is sawing hardwood at its highest efficiency.—H. J. K., in The Hardwood Record.

## Empire Lumber Company's Plans

Wm. G. Moore, president of the Empire Lumber Company, and Geo. D. Bouton, managing director, both of Philadelphia, Pa., recently visited Victoria, B.C. The Empire Lumber Company are planning to build up a large trade in British Columbia fir on the Atlantic Seaboard. In an interview Mr. Bouton said that he hoped to work up a business of from 100,000,000 to 200,000,000 feet annually. The value of British Columbia fir was coming to be better appreciated on the Atlantic Coast and he expected that it would displace other woods to a considerable extent for interior and exterior finish. Following up this belief the company is preparing to increase its logging capacity from 50,000,000 feet to 80,000,000 feet per year on its limits around Cowichan Lake.

Discussing the company's plans for manufacturing operations, Mr. Bouton said that at Crofton they believed that they had one of the best sites for a mill that could be found. At present, however they have not decided whether they will take over some of the coast mills or construct a plant of their own. It is the definite intention of the company to manufacture lumber on its own account and one of the objects of the visit of Messrs. Moore and Bouton was to settle this point. In the meantime the company is taking full advantage of its arrangement to cut on Genoa Bay. In addition to the 6,000,000 feet a year required for the Toronto Harbor works, the Genoa Bay mill will maintain its export trade as extensively as the market warrants.

# Lumber and Pulp Men

You will save money in placing your orders now for your requirements for 1915 and 1916 operations. As you are aware there has been an advance in all Raw Materials equal to about 7½ % to cover War Tax. We are still in position to give you the same prices offered on January 1st.

# EDGINGS

## Ontario

The Canadian Woodenware Company, Limited, Toronto, has been incorporated.

The Beaver Fibre Board Company, Thorold, Ont., sustained a loss by fire amounting to $18,000, on May 11th.

Geo. Rivers, Akrona, Ont., is contemplating the erection of a basket factory to cost $6,000 at Strathroy, Ont.

J. W. Short, Kenora, Ont., will operate his mill during part of the present summer on an output of lumber, lath and ties.

Over 500 men are employed at the Shevlin Clarke plant at Fort Frances, Ont., which recently commenced operations, and is running day and night.

A fire recently occurred at Henry S. Shaw's sawmill and planing mill at Tweedside, Ont. The loss is estimated at $3,000. There was no insurance.

The Pembroke Lumber Company, Pembroke, Ont., recently lost its sash and door factory by fire. The loss is estimated at $75,000 which is covered by insurance.

The partnership between Geo. Louks and John Florn, who carried on a lumber business at Simcoe, Ont., and Hamilton, Ont., has been dissolved by mutual consent.

The Bryan Manufacturing Company, Collingwood, Ont., whose plant was recently destroyed by fire report that they have not yet made any plans in regard to rebuilding.

The sawmill belonging to the Wallace Sawmill Company at Mt. Brydges, Ont., was recently destroyed by fire. The loss amounted to $7,000. The company contemplate rebuilding and purchasing new machinery.

The Victoria Harbor Lumber Company, Victoria Harbor, Ont., are operating only two of their three mills this season. Mill No. 1, the timber mill, and mill No. 2, are both operating. Mill No. 3, one of the saw mills, is idle.

Wm. Milne & Son's sawmill at North Bay, Ont., started operations during the last week in April. It is expected that the mill itself will have a large output this year. The shingle mill was also put in shape for a good season's cut.

The Columbia Lumber & Handle Company, Limited, has been incorporated with head office at London, Ont., and capital stock of $100,000. The incorporators include F. G. Rumball, John Stevely and W. H. Braddon, all of Toronto.

Capt. E. F. Kendall, Kenora, Ont., is installing a lath machine in his tie mill at Norman and will cut into lath a large number of cull ties which have been accumulating during the past two years. Capt. Kendall will also cut some lumber and ties.

The planing mill operated by Richard Smith & Sons at Niagara Falls, Ont., was destroyed by fire on May 9th. The damage amounted to $25,000. The entire stock of lumber was also destroyed and the machinery is reported to be a total loss.

The Commissioner of Works for Toronto, Mr. R. C. Harris, is receiving tenders for cedar ties for Lansdowne Avenue, extension to the civic railway. Tenders will close on May 25th. Specifications may be seen at the office of the Works Department, City Hall, Toronto.

The Rathbun Company, Deseronto, Ont., report that the Rathbun Match Company, Limited, which was recently incorporated have not as yet commenced operations. The company propose to operate at Deseronto and elsewhere, commencing when they consider conditions suitable. The capital stock fo the company is $125,000.

C. Weiler & Son, Formosa, Ont., recently suffered a loss by fire at their sawmill. The firm advise us that their cooperage and hand sleigh departments were completely destroyed, together with a large quantity o cooperage stock and machinery. The sawmill, lumber and shingle yards were saved. The insurance amounts to $4,000 which wilyl only cover part of the loss. The firm have not yet decided in regard to rebuilding.

The Pigeon River Lumber Company, Limited, has been incorporated with head office at Port Arthur, Ont., and capital stock of $500,000. The incorporators include Wm. Scott, lumberman, and D. W. Chamberlin, of Port Arthur, and F. Babe, F. R. Morris and C. A. Henderson all of Fort William. The company will acquire all the assets and property of the Pigeon River Lumber Company and carry on the business of lumber manufacturing, etc.

A serious fire occurred at the yards of the Wilson Lumber Company, Foot of Spadina Avenue, Toronto, recently. The blaze originated in the drying kiln where there was a large stock of lumber being dried. The cause of the fire is not as yet known. Although there were large quantities of stock in the yard, the firemen managed to restrict the flames to the kiln. The kiln was valued at $7,000, and the lumber inside was of a high value, but the total is not as yet known.

## Eastern Canada

The Ste. Anne Lumber Company, Limited, Montreal, has been registered.

Messrs. Prouty and Miller will operate a portable sawmill near Magog, P.Q., this summer.

The Swedish Canadian Lumber Company will operate their mill at Richibucto, N.B., this summer.

The Lake Megantic Lumber Company's plant at Lake Megantic, P.Q., commenced operations on May 1st.

The Moncton Wood Working Company, Limited, Sunny Brae, N.B., are advertising their land, buildings, plant, etc., for sale. Tenders are being received until May 28th.

The firm of Legault & Leger, sash and door manufacturers, Montreal, has been dissolved and the firm of Legault, Leger & Bourgeon has been registered.

Mr. E. W. Tobin, M.P., recently visited his company's operations be-

tween Quebec and Ste. Anne. He expects to get out some 17,000 cords of pulpwood this season.

The name of the Quebec and St. Maurice Industrial Company, La Tuque, P.Q., has been changed to that of the Brown Corporation.

The Quebec Streams Commission are calling for tenders for the construction of a dam, 1,720 feet long, at La Loutre on the St. Maurice River. The plans provide for a sluice for logs.

The Swedish Canadian Lumber Company's sawmill at Rexton, N.B., will not operate this summer. Arrangements have been made for several vessels which will ship out the lumber the company now has on hand.

"The Little Bonaventure Lumber, Limited," has been incorporated with head office at Quebec, P.Q., and capital stock of $20,000. The incorporators include J. Ferlatte, H. Robichaue, J. P. Eugene Gagnon, L. A. Letourneau and L. Auger.

The York & Sunbury Milling Company started operations at their mill at Pokiok, N.B., during the last week in April. The company have 8,000,000 feet of logs to be sawn. Of this amount 5,500,000 feet will be sawn at Gibson, N.B., and 2,500,000 feet at Pokiok.

The Forest Reserve Pulp & Paper Company (formerly the York Lumber Corporation) have installed three new shingle machines in their plant at Sandy Beach, P.Q. The equipment of the mill now amounts to ten machines, all of which will be in operation this season.

A fire recently occurred at Hull, P.Q., in the lumber yard and sheds of H. Dupuis & Son. The loss is estimated at $8,000 which was covered by insurance. About 1,600 cords of 4-ft. wood was destroyed. The greater part of the wood had been sold to Heney & Company of Ottawa.

The Makamik Saw Mill Company, Limited, has been incorporated with head office at Molesworth, P.Q., and capital stock of $20,000. The incorporators include L. N. Boisclair, Princeville; J. B. Boisclair, Saint Samuel de Horton; D. Lambert, Warwick; L. E. Boisclair and O. Boisclair, Princeville.

The Bathurst Village and Nepisiguit mills of the Bathurst Lumber Company started their season's operations on April 30th. It was then expected that the company's logs would commence to arrive during the first week in May, after which both plants would be run day and night for the rest of the season.

The Penningtons, of Quebec, are arranging to develop their timber limits near Lake St. Charles, and have again approached the Quebec & Lake St. John Railway for an extension of their line, the object being to bring out pulpwood. It is stated that the request will be granted and a spur built from Indian Lorette to Lake St. Charles this summer.

La Compagnie Forestiere et Immobiliere de Quebec, has been incorporated with head office at Quebec, P.Q., and capital stock of $49,000 to exploit and sell forest products to construct houses, buildings, etc., and to manufacture wood into its various products. The incorporators include G. C. Piche, C. Gallois, Wm. Borel, F. Barrelet and B. Guerin.

Under an agreement proposed to be made by the Newfoundland Government with the Newfoundland Products Corporation, Limited, represented by Mr. T. L. Willson, of Woodstock, Ont., with whom is associated the Reid-Newfoundland Company, a sum of over sixteen million dollars will be expended on the construction and equipment of large plants in Newfoundland and Labrador. It is proposed to establish at Bay of Islands an industry for the manufacture of various chemicals, wood pulp and lumber. The saw mills are estimated to cost $211,800, and the sulphite pulp mills, electrolytic bleaching plants, and works for the manufacture of wood preparations will involve an outlay of $1,568,300.

Rumors are current of the possibility of another merger of pulp mills. Three years ago the Chicoutimi Pulp Company and the Ouiatchouan Falls Pulp Company were amalgamated. It is now stated that these amalgamated companies are likely to be merged with the St. Lawrence Pulp & Paper Corporation, whose plant has just been completed in Gaspe, and there is also talk of adding the Tidewater Paper Company, which has been operating in Brooklyn for a few years, and which obtains its supply of ground wood pulp from Chicoutimi. J. E. A. Dubuc, the managing director of the Chicoutimi Pulp Company, recently became connected with the St. Lawrence Pulp & Paper Corporation. He is now in Europe, working, it is stated, in connection with the merger scheme.

## Western Canada

Fire recently destroyed the sawmill belonging to Mr. Persons, Onion Lake, Sask.

The Ross-Saskatoon Lumber Company, Baynes Lake, B.C., started operations during the first week of May.

W. H. McClinton, general store and lumber dealer, Pilot Butte, Sask., has moved his business to Belle Plaine, Sask.

A fire recently occurred at the Imperial Lumber Yards, Lajord, Sask. The loss is estimated at $5,000, partly covered by insurance.

The Victoria Lumber & Manufacturing Company, Chemainus, B.C., commenced operating at full capacity during the last week of April.

The Revelstoke Sawmill Company, Limited, has bought out the business and stock of the Stern Lumber Company, at Donalda, Alta. A. L. Harvey is the new manager.

The North West Lumber & Supply Company, Regina, Sask., recently suffered a loss by fire, amounting to about $25,000. Their buildings and lumber were insured. They will rebuild.

The Ohio Lumber Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $300,000. The company will acquire timber licences owned by L. E. Ewing in the West Arm of Quatsino Sound, B.C.

Negotiations have been concluded between the Selkirk, Manitoba, Industrial Sites Committee and Mr. J. S. Hughes, of Mill Village, N.S., under which Mr. Hughes undertakes to erect and operate a paper mill at Selkirk. Work is to be commenced at once and it is said that the estimated cost of the plant is $150,000.

Toronto, April 17th, 1915.

C. Manseau, Esq.,
Sales Manager, The Moreau Barking Machine Co., Ltd.,
Drummondville, Que.

Rossing Machines

Dear Sir:

Acknowledging your letter 12th inst. in which you state that you have been informed by your Mechanic that we had to quit Pulpwood Barking, et al.

Facts are that the purchasing of the few machines which we did, was for purpose of educating people up and along Lines of the necessity. After having served that good purpose, we disposed of our machines, and to-day the rossing-peeling, and barking of Pulpwood increases to larger and larger extent, and that is what is desired for the market—Pulpwood outlined, and not with the Bark on.

**We are very glad to subscribe that your machines are doing very good work along Lines.** We are forwarding your letter to our C. E. & S. of M., S. B. Clement, North Bay, who may be enabled to furnish you further information and assistance of interest.

Thank you for the courtesy.

Yours truly,
J. L. Englehart,
Chairman.

Nushka Station, April 12th, 1915.

The Moreau Barking Machine Co., Ltd.,
Drummondville, Que.

Attention Mr. C. Manseau, Sales Manager.

Dear Sir:—

I must say that your machine is very good and we can easily bark 25 to 30 cords of four feet wood per day.

I have used several machines in the past, and I can certify that yours is the most satisfactory I have handled.

We have barked three hundred cords of pulp wood (128 cubic feet) per cord in eleven days.

Very truly yours,
(Signed) Joseph Perrault.

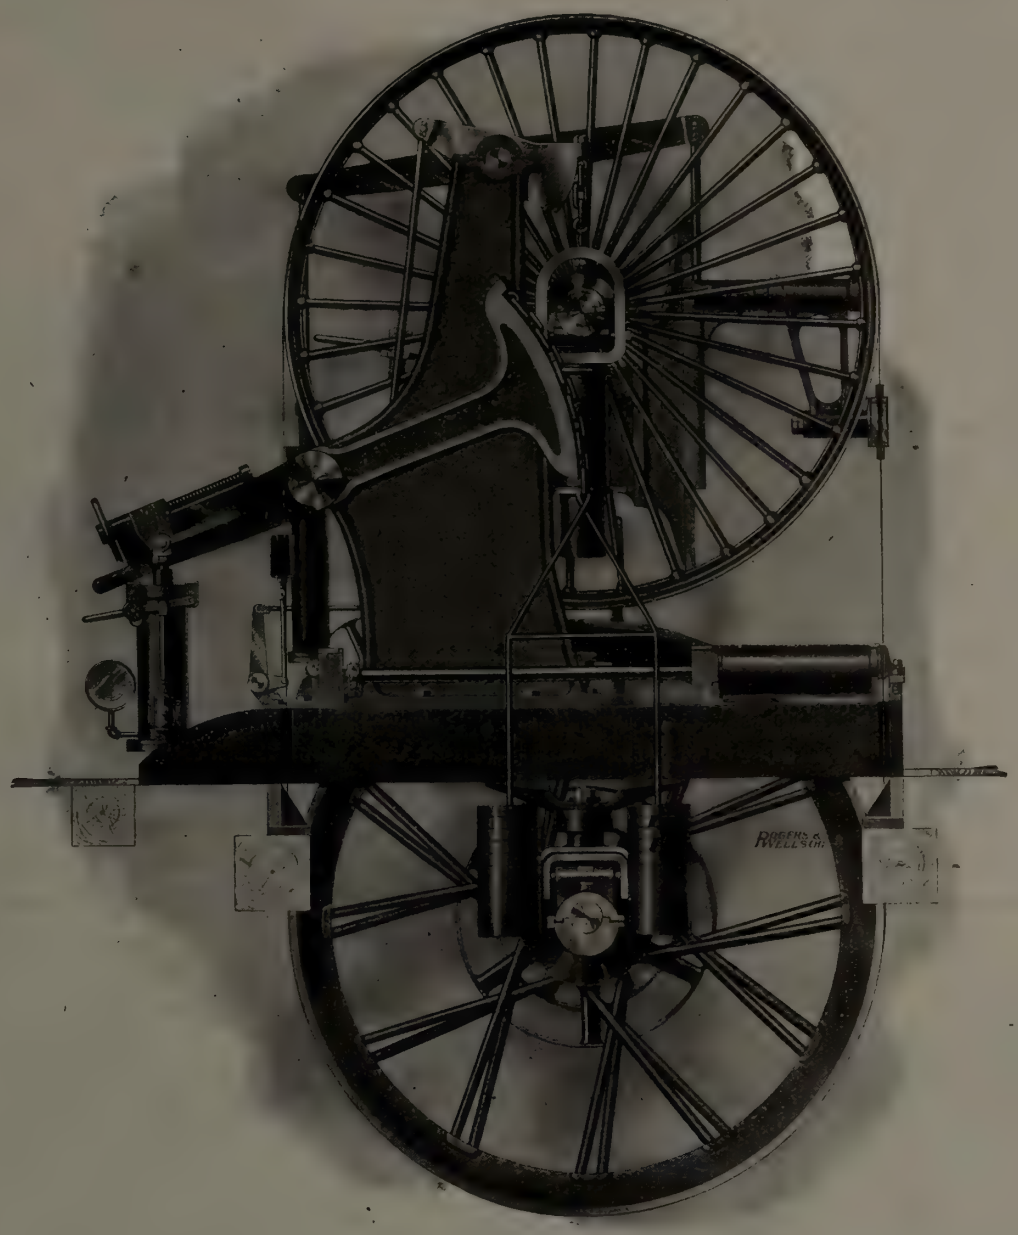
# The Steam Tension Band Mill



It is called the steam tension mill because the tension is maintained by steam—the most sensitive form of tensioning which has been devised.

The result of this is a great saving in saws—**several users of the machine have run through an entire season without cracking a single saw.**

But in addition to raising and lowering the top wheel by steam, there is a separate cylinder for operating the top guide, and these two cylinders make ours an entirely steam-operated mill, and, therefore, exceptionally fast.

It is made with 8 ft., 9 ft. and 10 ft. wheels, and will stand thorough investigation.

Write for bulletin and list of users.

**Portland, Maine, U.S.A.**

**This engine is 13½ ins. x 18 ins. and weighs 35 tons.**

The knowledge and experience of fifty years in locomotive designing and construction is what you get in our Logging locomotives. They are specially constructed for logging operations and will stand up to the severe service in which they are expected to run. Oil or coal burning.

They are as carefully designed and built as our 200 ton locomotives. Repair parts may always be obtained on the shortest notice.

**Grey Iron Castings—any size or shape—ordinary or intricate—made promptly. New foundry, splendidly equipped. We would be pleased to quote on castings—singly or by contract. We also make drop forgings of all descriptions.**

**MAY WE SEND YOU SPECIFICATIONS?**

It's a Pink anyway you take it, and it's the best Peavey made.

# Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

# Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

**W. W. Cory,**

Department of the Interior, Ottawa,
December 20th, 1912.

Deputy Minister.

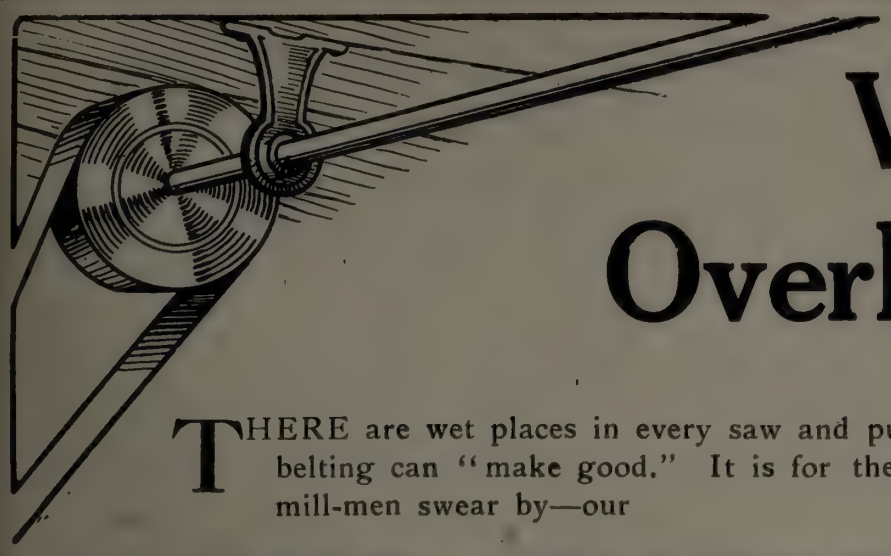
## "Wilson Bros." Hardwood Flooring

**is the Flooring that is manufactured expressly to supply the demand for the best. It is made by modern machinery from carefully selected stock, and every precaution is taken throughout our entire system to make it fulfil the requirements in every particular. Write us for prices.**

**Wilson Bros., Limited - Collingwood, Ont.**



# When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for these wet places that we recommend what most mill-men swear by—our

## "ACME WATERPROOF" BELT

This belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.

When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

***Prices and particulars on request.***

## J. L. Goodhue & Company, Limited

**DANVILLE, - QUEBEC**

# For Cutting Pulp Wood

The **Ryther Multiple Saw Slasher** will cut 1,000 logs and over per hour into absolutely Uniform Lengths — Highest Possible Efficiency — Lowest Cutting Costs, per Cord — Minimum Maintenance and Repair.

# The Belting That Will Stand Floods

TRADE MARK
LANCO BALATA
BELTING

We have large stocks of this belting at both our Toronto and Montreal offices.

If you have not used this Balata Belt send us your next order. Remember, if we have the data governing the drive at the time of sale we guarantee every belt we send out.

## Federal Engineering Co.
Limited

**Toronto - Montreal**

## Weatherbeaten Over Ten Years

**The story the other fellow tells about Neptune Waterproof Leather Belting is even stronger than ours. Just read the following voluntary letter:—**

Madera, California, June 7, 1911.

"For the past seven years we have had in continuous use one of your 12-in. double "Neptune" Belts on our hog. This belt has been, and is still running in the open, and is exposed to all rain, fog, hot sun, and any and all kinds of weather, and is still a good belt, and in good condition."

Madera Sugar Pine Company,
A. P. Froom, Foreman.

WESTERN UNION TELEGRAM
May Sixteenth, 1914.

"Madera Sugar Pine twelve inch Neptune still running and giving good service."

**There you have it—unmistakable proof of the absolute waterproof quality of Neptune Leather Belting. The use of Neptune Belting in your plant is an assurance of belting service in the highest degree. Make your next order a Neptune Order.**

# ONTARIO
## Canada's Banner Province

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.
Pulpwood, 246,282 cords.
Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

**Ontario's vast resources offer unsurpassed opportunities to the lumberman.**

# Labor Saved Is Time Saved

When to this is added increased durability we have the economy that naturally results from larger output and long service.

These are some of the strong points in favor of

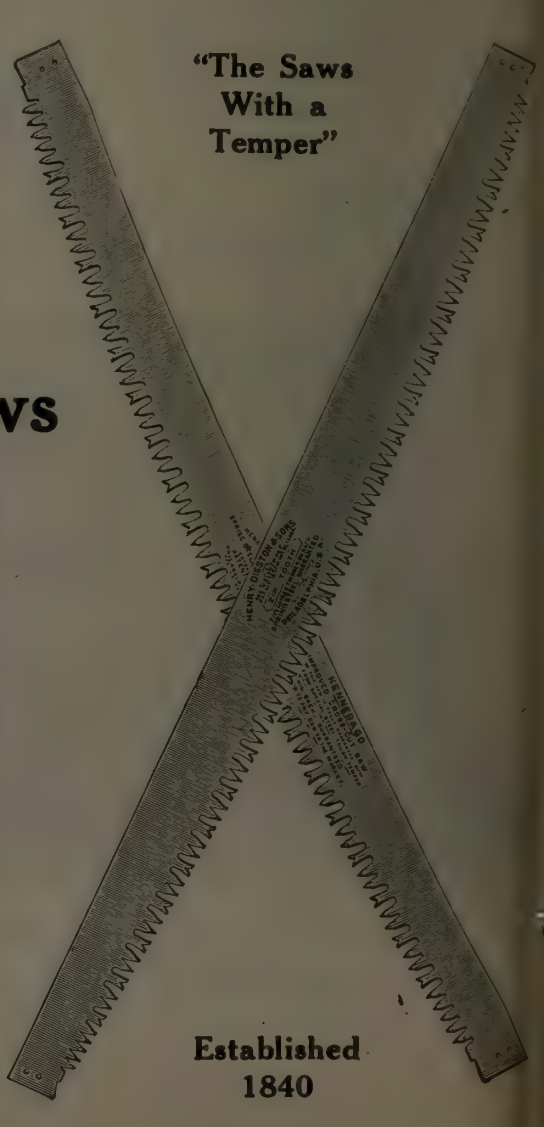
# Disston Cross-Cut Saws

They are ground to a true taper all the way from cutting edge to an extra thin back. Being ground on lines that conform exactly to the breast of the saw, the blade is absolutely uniform in thickness throughout the entire length of the cutting edge. This special method of grinding gives the maximum amount of clearance with the minimum amount of set, without sacrificing elasticity and stiffness. You know that all these points are good points, and substantiate our claim that Disston Cross-cut saws are unexcelled.

You will find a lot of valuable information in our Cross-Cut Saw Booklet. Sent free on request.

## Henry Disston & Sons Ltd.
**Keystone Saw, Tool, Steel and File Works**
**2-20 Fraser Ave.**
**TORONTO, ONT., CAN.**

**"The Saws With a Temper"**



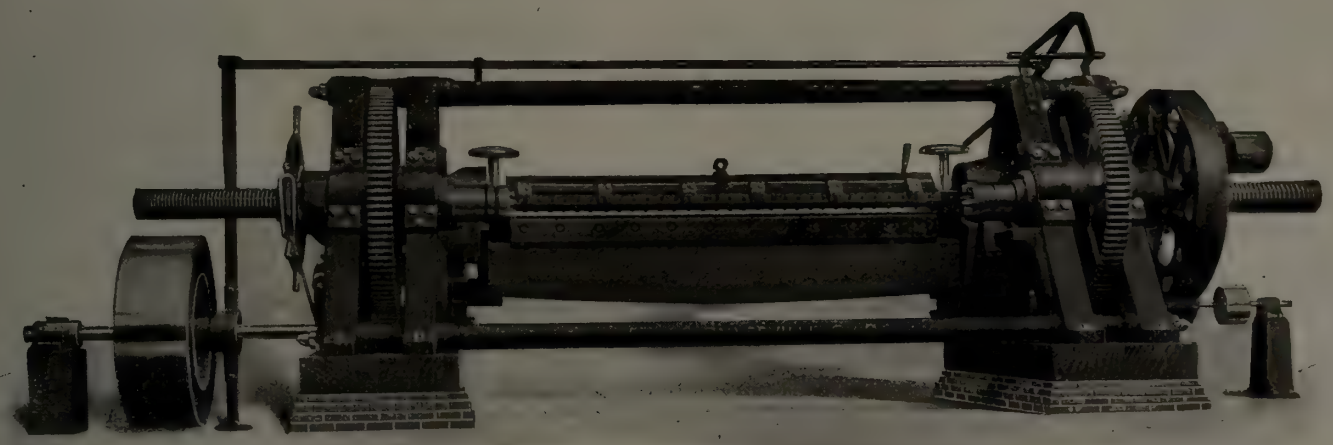
**Established 1840**

# Veneer Machinery

**The Standard of the World for Sixty-Four Years**

## The Coe Rotary Veneer Cutter

**Style "A" Extra Heavy Pattern**



**Front Veiw**

**Made for any length of knife up to 120 inches; diameter of swing, 68 inches; diameter of spindle, 6 to 8 inches; weight is proportionate to length of knife.**

The chief things required of any machine are ability to stand severe and continued use, and ability to do its work in the manner claimed by its makers.

From the first the Coe policy has been to design the most able Veneer machinery that expert knowledge could conceive, and experience suggest, and to make the Coe Veneer machines the best that selected material and skillful workmanship can produce.

We make the largest line of Veneer machines in the world and are always ready to answer questions about Coe machines. When an inquiry comes to us, we lay bear all the facts in question, for this is one of the means whereby the good points of the Coe Veneer Machines become known. Don't hesitate, therefore, to ask us questions regarding Veneeer Machines for Cutting, Slicing, Clipping, Wringing, Sawing, Drying or Stamping, or producing Veneer from any kind of lumber.

Judged by standards that go to make the best Veneer machinery, Coe Veneeer Machines represent the best types made to-day—in capacity, resistance to wear and tear, and in excellence of product.

We are ready to plan and equip a mill complete for any capacity and we can furnish a full line of machines or any single one needed and make practically immediate delivery.

# The Power of "A Want Ad."

When you have something to sell that another is likely to want, or if you want something, a sure way to get in touch with your party is through a "want ad." This class of advertising the world over is a rapid and positive means of finding your man.

If you have any wants in the lumber business the quickest and most inexpensive way to satisfy them is by advertising in the **Wanted and For Sale Department** of the Canada Lumberman and Woodworker.

Twice a month "the paper with the green cover" brings together buyers and sellers of lumber and machinery from all the principal lumbering centres of Canada and the United States. By covering this wide though specialized field, waste circulation for advertisers has been eliminated.

For quick and satisfactory results, get your advertisement in the **Wanted and For Sale Department** of the

**Canada Lumberman & Wood Worker**

# *Only the Best Is Good Enough*

THE work your filer does is limited to a great extent by the equipment he uses.

Give him the kind that allows him to keep your saws in the best possible condition—and his work will be reflected in the out-put of your mill.

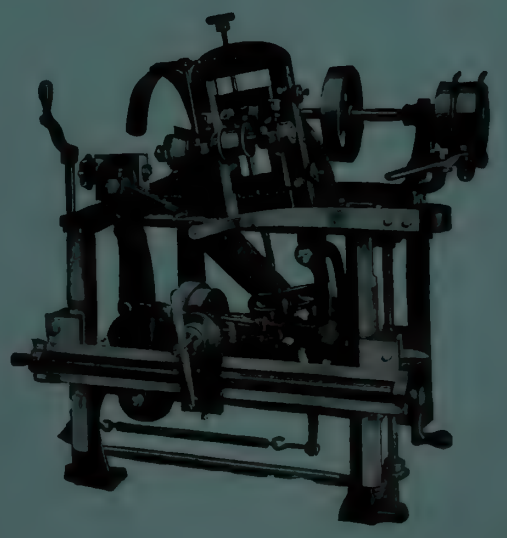
Smooth cutting, easy running saws mean smooth sawn lumber—the secret of both is—

# "COVEL" SAW FILING EQUIPMENT

## For Band and Circular Mills—Any Size

Both in Canadian and American installations, where severe saw service is the general rule, COVEL Filing Room Equipment is giving excellent results. It is producing larger cuts of better lumber wherever used. Your filer needs that kind of equipment.

We can supply COVEL Saw Filing Tools capable of handling circular saws up to 84 ins. in diameter and bandsaws up to 20 ins. wide, that will help him keep your saws in better shape at less cost than ever before.



There is only one kind of Saw Filing Equipment good enough to use on good Saws—the best. "COVEL" is the name. Remember it when you are buying Filing Room tools.

"Leather like gold has no substitute."

The Waterproof Belt with the Surface that Grips the Pulley

"AMPHIBIA"

The Only Belt for Mills Sawing Green or Wet Logs or Lumber

# "AMPHIBIA"

There is more knack and "know how" required in the manufacture of a perfect leather belt than in the manufacture of almost any other product used in a mill.

39 years of experience have taught us the secrets of successfully making leather belting that is absolutely waterproof and impervious to water or oil. The hides used in "AMPHIBIA" belting are obtained from the best stock at a season when the hides are toughest. They are carefully tanned in our own tanneries by a secret waterproof process.

The best of the butts is then selected for use in "AMPHIBIA" belting, any weak or thin spots having been culled out by experts.

"AMPHIBIA" has been "Made in Canada" for 39 years. When ordering state where the belt is to run.

# Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

**We have the following Sawmill Machinery for sale:**

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

## FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

## POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

## To the Owner of Timber Lands

Far sighted owners of timber lands should take advantage of the times incident to the European wars, and prepare themselves for the day when the demand for timber is suddenly thrust upon them. This is certain to come at no distant day. Therefore cultivate a closer acquaintance with your holdings, and the best method of marketing them. Let us prepare the way for you. Remember, we not only report on the property, but assist in marketing the bond issue when necessary. Send for our booklet.

***Daily Capacity—Two Million Shingles***

What's in a name? To the wise buyer a particular brand means everything. Why? Because he knows the kind of a shingle he is going to get when he specifies on his order a certain brand. After extensive investigation we have come to the conclusion that the average American buyer is willing to pay the price for a superior article if his trade demands it. Further than this: When the tariff on shingles was removed, the average Canadian shingle manufacturer was under the impression that the regular brand of shingles, particularly as to thickness, would be generally accepted by the trade in the American markets, but experience has taught us differently. We positively know that a **Premium Brand** is the ready seller, and secures for the manufacturer an established and reliable trade. Bearing all of this in mind, we have made a special effort to produce shingles that will meet the requirements of high-class American trade.

The **"Shamrock"** brand spells **Perfection** in every particular, and carries a guarantee that insures you protection. Below is our guarantee:

**"SHAMROCK" BRAND.**

| | Length | | Thickness | |
|---|---|---|---|---|

British Columbia Douglas Fir

# British Columbia TIMBER

With the tremendous demand for timber that will arise at the close of the War, the eyes of the world will turn to **BRITISH COLUMBIA** with its magnificent stand of more than **400,000 million feet** of splendid merchantable timber.

### Home of the Douglas Fir

British Columbia is the home of Douglas Fir, a tree that has no superior—as has been proved by many tests—for dimension timber. British Columbia furnishes fir timber 20 in. x 20 in. x 80 ft. British Columbia supplies Douglas Fir for general construction purposes, for interior finish; trim; panelling; moulding; ceiling; flooring; furniture; railway ties; piling; paving blocks; cooperage, etc. British Columbia supplies **Western Red Cedar,** unsurpassed for siding; ceiling; shingles and boat construction; the finest of **Western Hemlock,** an excellent wood for general construction, box making, pulp material and interior finish; **Spruce,** for box making and general construction.

### A Great Timber Province

British Columbia is far-famed for its timber resources. The value of the lumber industry to the Province in 1913 was $33,650,000. British Columbia has **335** saw mills with an annual capacity of **2,500 million feet.** The Province produces **1,000 million cedar shingles** a year. British Columbia produces annually $2,500,000 in news print and high grade sulphite pulp. Enormous quantities of raw material afford great opportunities for further pulp manufacture. The timber resources of British Columbia have only been sampled. The period of highest development is still ahead.

### Information Service

The Forest Branch, Victoria, will give immediate attention to requests for information as to the strength, uses and qualities of British Columbia woods and will, further, undertake to distribute, free of charge, all enquiries for material. If so desired the Forest Branch will receive tenders for submitted specifications and will refer quotations by letter or cable to foreign enquirers.

## Campbell's XXX

### Hammer Poll Axe

**Something New**

Lumbermen find it difficult to get axes, which will stand hard usage in driving saw wedges.

Our invention we guarantee for driving wedges, bolts, etc.

The poll is made from best cast steel V-shaped welded into poll of axe and cannot come apart or flatten out.

It is made to balance and will chop easier than light poll axes.

After using Campbell's Hammer Poll Axe you will discard striking hammers, mall or old style axes.

Order a sample dozen, you will order more when you try them.

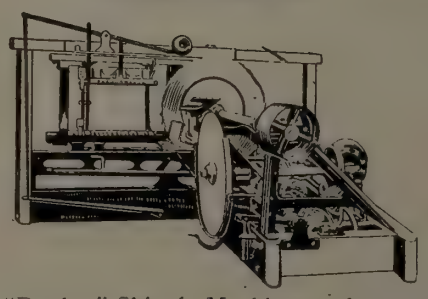
## *"Dunbar" Shingle Machine*



The "Dunbar" Shingle Machine works smoothly and swiftly producing shingles of uniform cut at a low cost.
Specifications are 2 38 Shingle Saws and 1 36-in. Jointer Saw. Speed, 1,600 r.p.m. Capacity 16,000 to 30,000. Weight 2,800 lbs. Main Arbor, 2 7-16 in. Polished Steel. Adjustable rackets. Boxes Ring-oiling.

## Satisfied Users :

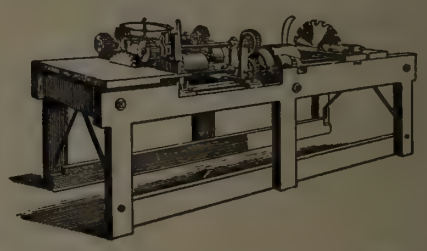
Fraser Limited, Fredericton, N.B.; Babbitt Lumber Co., St. Marys, N.B.; Turgeon & Williancourt, Amqui, Que.; Blue River Lumber Co., Cabano, Que.; Freeman & Giffin Co., Isaac's Harbor, N.S.

Write us in regard to your Shingle Mill requirements.

We also make Sappers, Cedar Cut Offs, Lath Machines, Car Wheels, and Castings of all kinds.

We will gladly supply you with information and prices.

## *"Superior" Lath Machine*

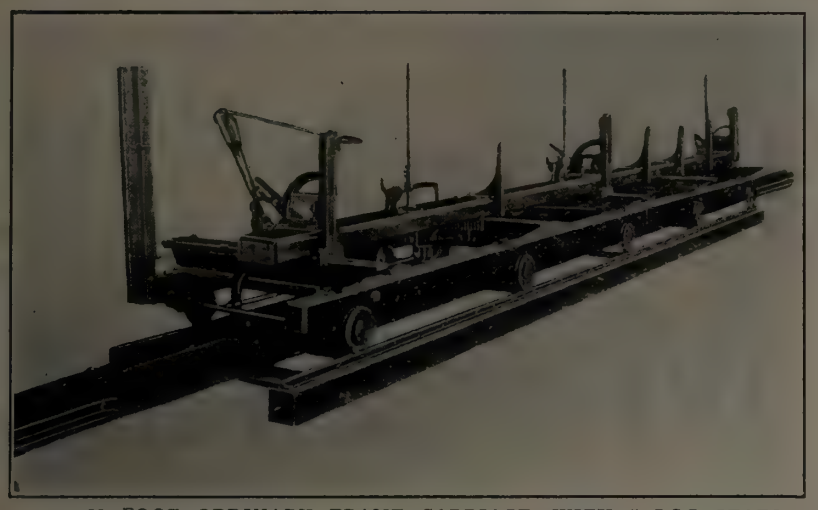


The "Superior" Lath Machine is well constructed of high-grade materials. It stays on the job saving time and money. It gives satisfactory results. 15 to 20 horse-power will run it. Capable of taking three saws. Specifications are: Wooden frame. Belt Feed. Ring-oiling Boxes. Driving Pulley 10 ins. diameter, 9-in. face. Sawing capacity with two saws 40,000 and 50,000 a day.

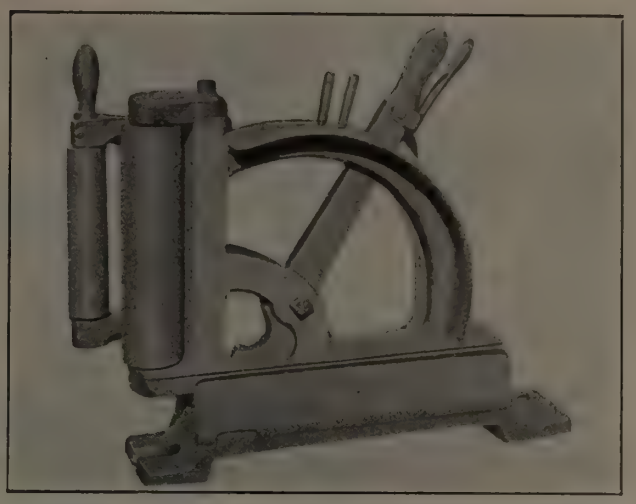
## The Smith Foundry Company, Limited

**FREDERICTON, N.B.**

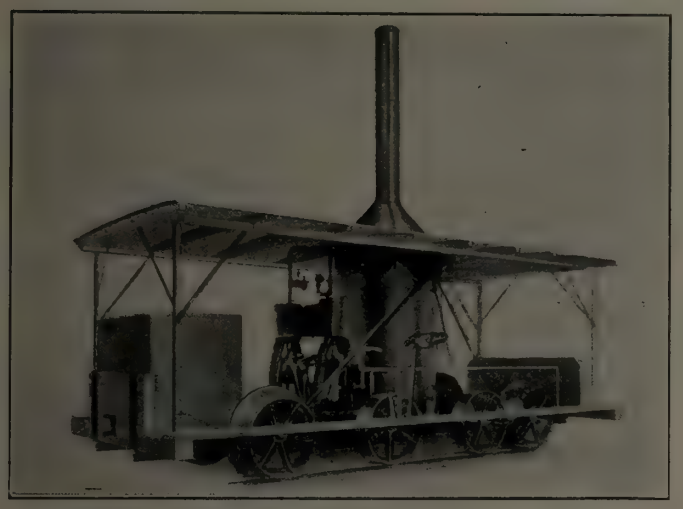
# The OXFORD Line
## of Sawmill Machinery



**20 FOOT ORDINARY FRAME CARRIAGE, WITH 5 LOG SEATS, WITH 3 SLIDES**—Built in many sizes to suit purchasers.

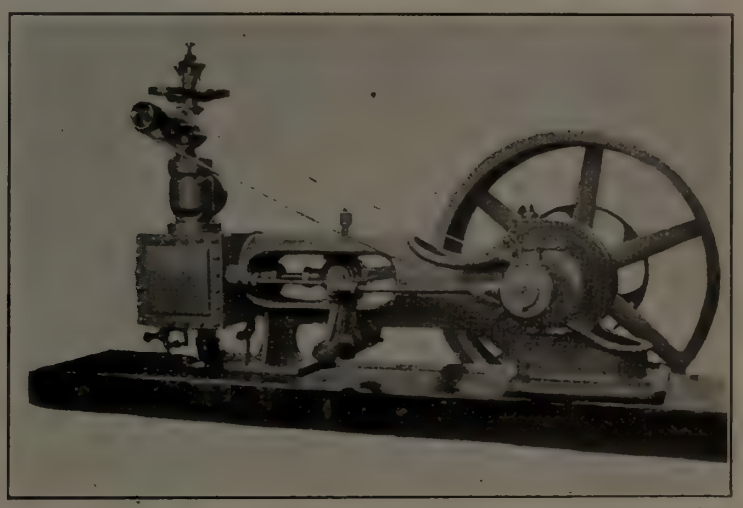


**OXFORD BOARD AND DEAL GAUGE (RIGHT HAND)**—We also make left hand for left hand carriages. Notice extra roll—when this is set to saw a board, to set for deal simply swing this roll back, so large roll comes in contact with deal, then with the lever you can set roller to saw any thickness in ¼-in. from **0** to **6** in. **These gauges supplied on all our portable mills.**

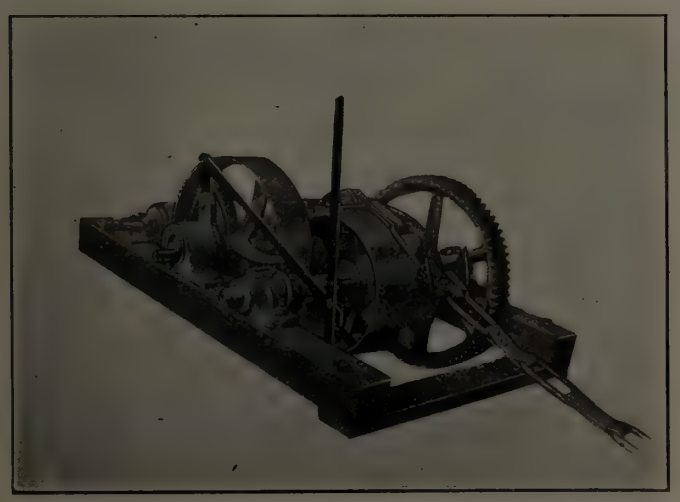


**OXFORD TRAM ROAD ENGINE**—Runs on sawn wood rail 4 x 4 Hardwood or 4 x 6 Softwood. In winter, put a set of creepers on wheels, these are furnished. Steamer is under the control of driver, gasoline has to be stopped to reverse. In steamer the reversing lever will almost instantly stop or reverse motion of car, no troublesome gearing. Customer who used both says: "Cost of fuel for the gasoline was over four times as much as for steamer."

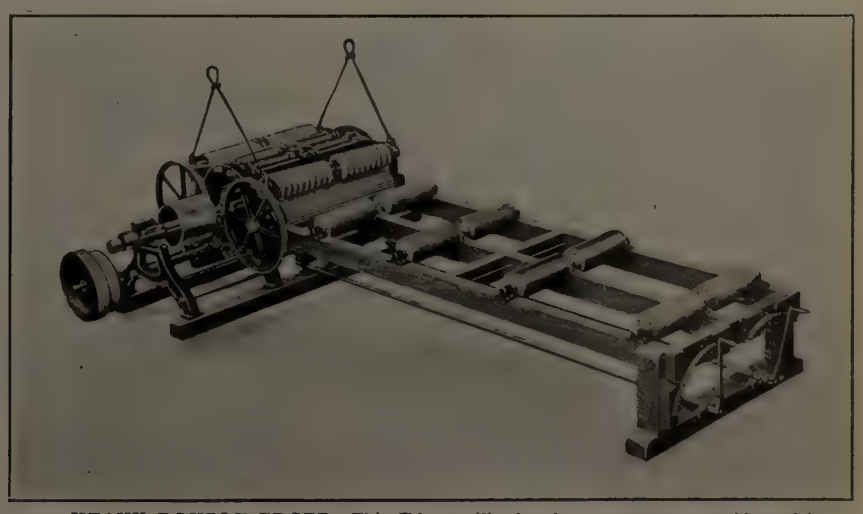
Machine weighs about eight tons. A machine of this kind has hauled 20 thousand sup. feet of lumber up 5 per cent. grade. 20 M. feet of lumber with eight trolleys would weigh about 35 tons.



**NEW MODEL HORIZONTAL ENGINE**—Advantages:—Main bearing sets nearer vertical which brings adjustment now in line with the wear. Main bearings adjusted with taper key, and screws can be adjusted while engine is running. Balanced crank which permits of high speed without vibration. Main pulley has split hub, rim of wheel sits over bearing about 4 inches which brings strain of belt direct on bearing. Shaft and bearings are heavy enough to put trimmer pulley on with large pulley, thus getting trimmer belt out of fireman's way.



**ENDLESS HAUL UP**; geared and friction with 30 inch by 4 inch face gear, 6 inch by 4 inch face pinion, 30 inch by 6 inch face cast iron friction, 6 inch leatherboard friction, pulley sprocket 21 inch by 14 inch with forged lugs, eccentric box and iron lever, for use with our forged chain with steel or cast iron carriers.



**HEAVY DOUBLE EDGER**—This Edger will edge for a gang on one side and rotary on the other, cutting any different thickness of stock on either side, and going through Edger at same time. Built with variable friction feed if required. Also resawing attachment.

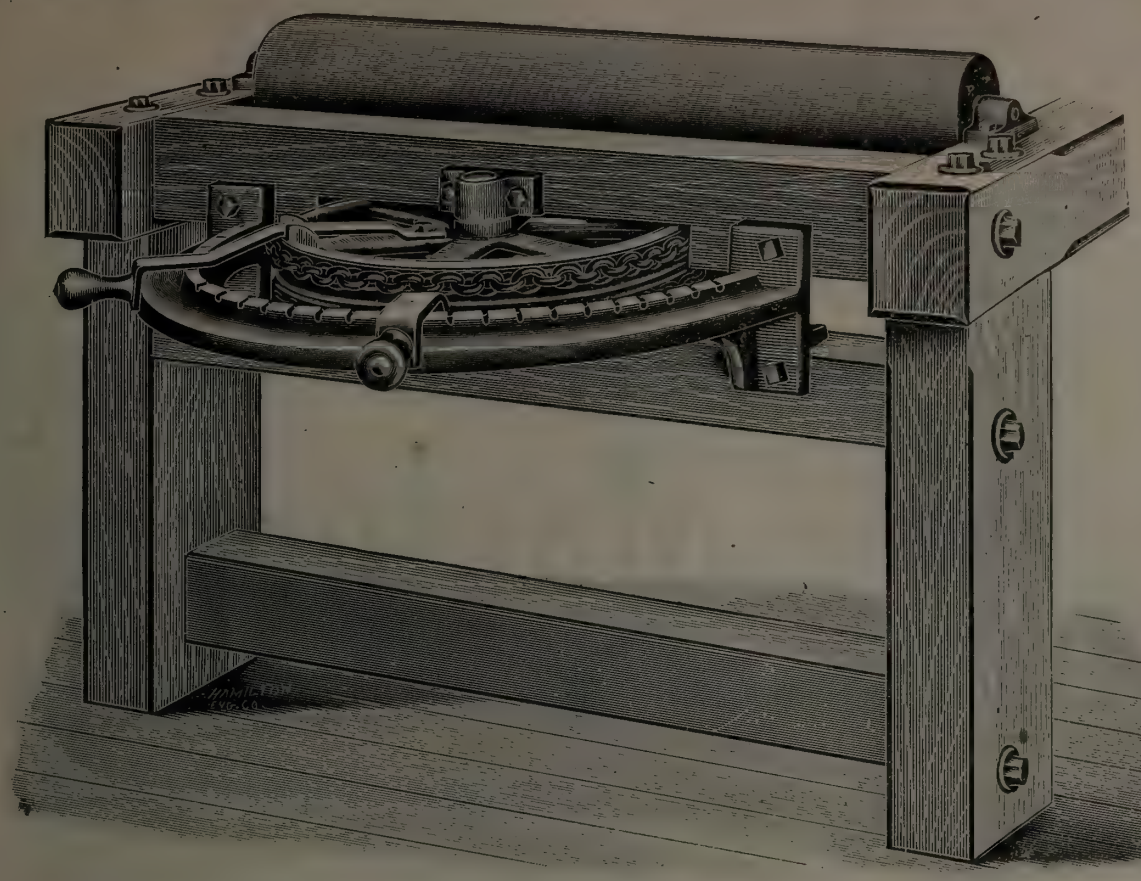
## Dunbar Engine & Foundry Co.

WOODSTOCK, N. B.

# Lloyd's Improved Chain Set Gang Edger



**Section Showing Rear End of Roller Frame with Chain Setting Mechanism in Place.**

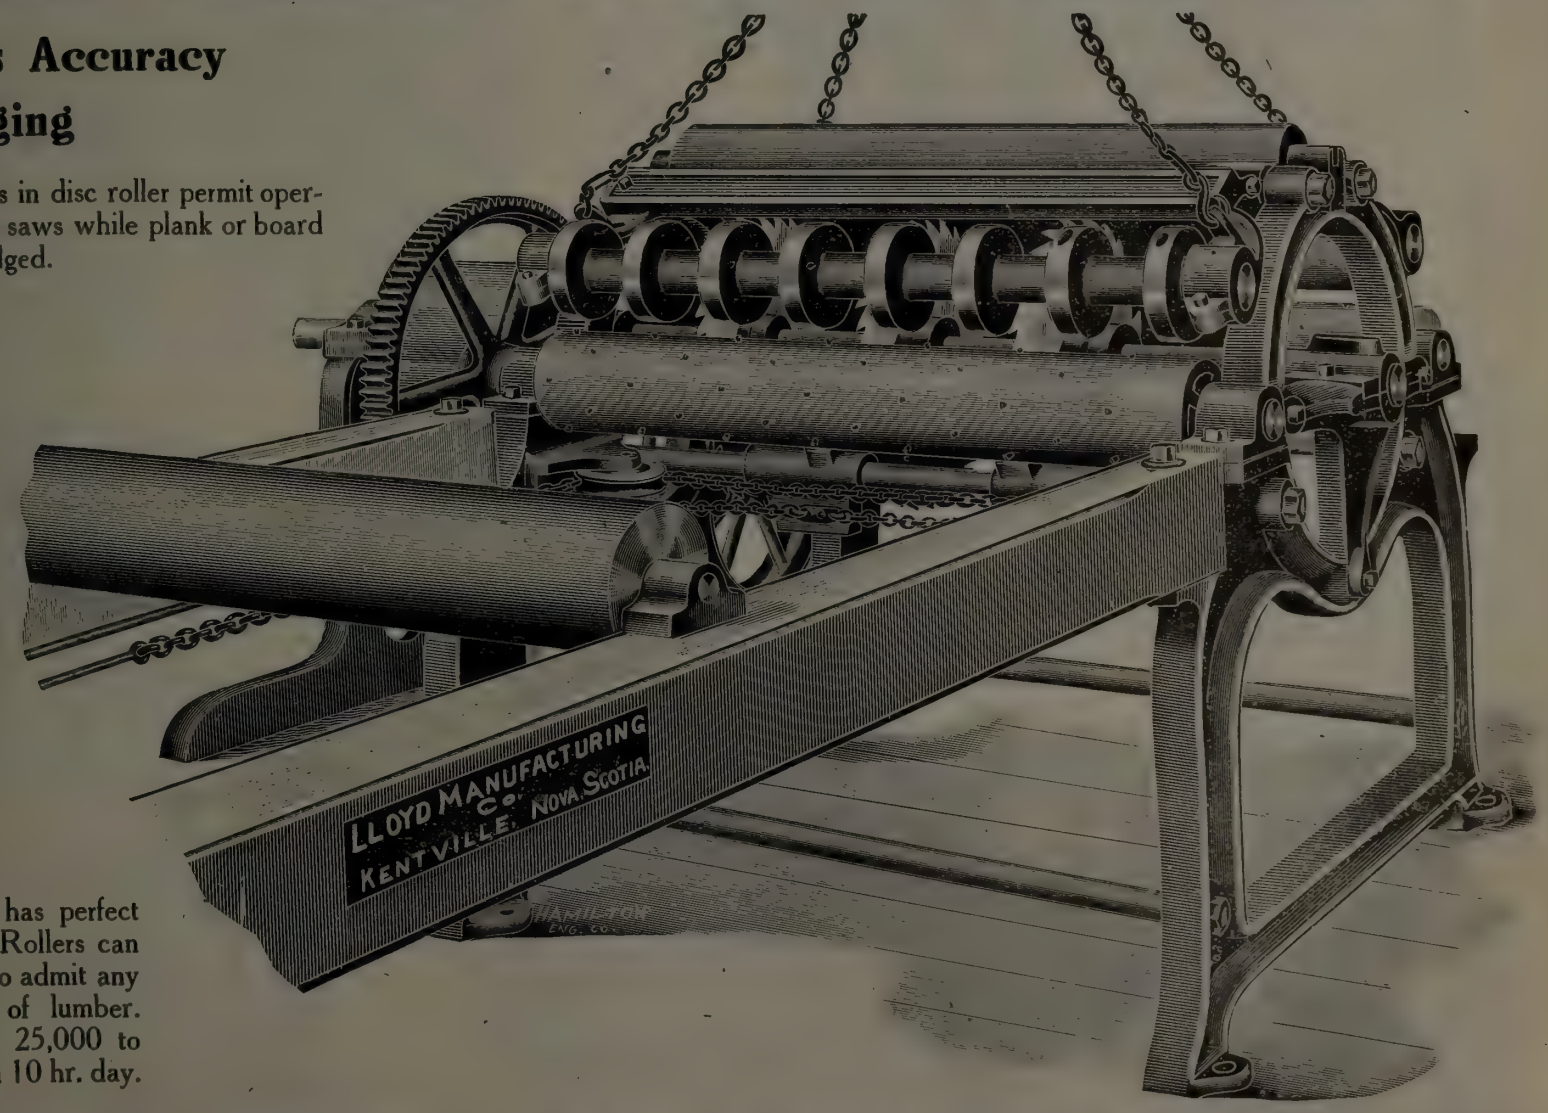
This chain setting mechanism will accurately set saws to the 1/16 of an inch. Simple construction and skillful design afford perfect set at all times even after years of service. Set allows saws to come together within 2 inches. Notice that levers are attached to sheves. To rotate sheves these levers swing over graduated quadrant marked with inches regulating distance apart of saws.

Spring steel levers which have V-shaped point projecting downward lock lever in any desired point of graduated circles. This device holds saws firmly, accurately in place while lumber is being edged.

# This Improved Chain Set Gang Edger

## Means Accuracy In Edging

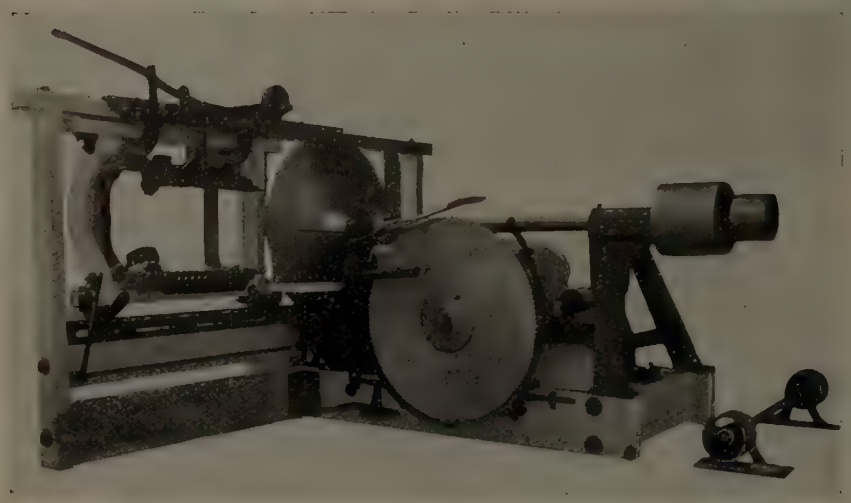
The spaces in disc roller permit operator to see saws while plank or board is being edged.

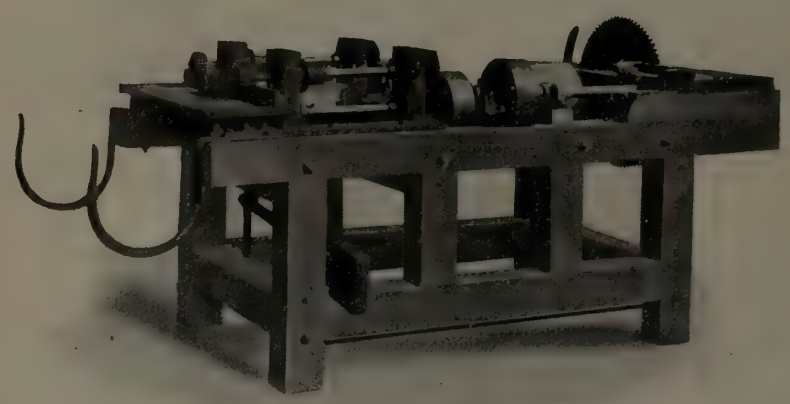


Operator has perfect control. Rollers can be lifted to admit any thickness of lumber. Capacity 25,000 to 30,000 in 10 hr. day.

## Lloyd Manufacturing Co., Limited, - Kentville, N. S.

# MARITIME PROVINCES





# Sawmill Machinery

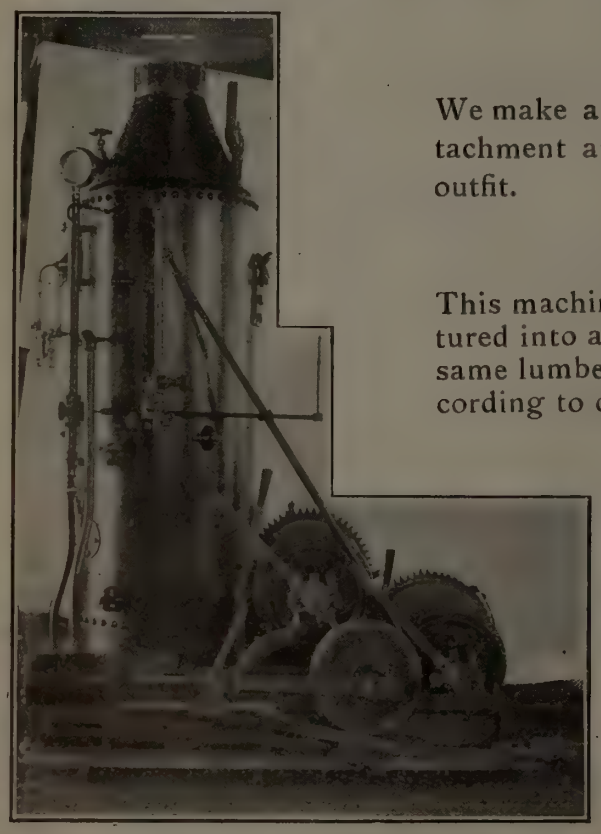
## "Dunbar" Shingle Mill

This "Dunbar" mill is acknowledged the most complete and satisfactory shingle mill on the market. It has a capacity of from 15000 to 20000 per day, according to the quality of the lumber to be sawn.

## Lath Mill

This machine is inexpensive in construction yet is capable of turning out the very best class of work and at a high speed.

There is much waste in every sawmill that can be turned into saleable lath by this improved lath mill.



## Hoisting Engines

We make a strongly constructed and powerful hoisting engine with every attachment and convenience necessary for a complete hoisting or contractors' outfit.

## "Dunbar" Clapboard Machine

This machine will make clapboards out of lumber that cannot be profitably manufactured into anything else. It is guaranteed to take from 15% to 20% more out of the same lumber than the old style machine. Capacity from 5000 to 7000 per day according to quality of lumber. **It will pay you to get full particulars of our machines.**

## BEST THE WORLD OVER

Experience proves that, for every purpose for which Wire Ropes are employed, the Allan Whyte lines stand the hardest tests, give the longest, most uniform service possible in Ropes of this kind, and effect the greatest saving in the end.

The materials used by these makers are the highest grades of the kinds best suited to the work for which each particular class of Rope is intended, are made especially for them, and must pass rigid factory inspection before they are manufactured.

The cores to Ropes and strands are of the Best Manilla, Hemp and Jute as circumstances demand, and every stage of manufacture is carefully followed along the most approved lines dictated by wide and lengthy experience, even to the smallest detail.

Rossing Machines

Dear Sir:

Acknowledging your letter 12th inst. in which you state that you have been informed by your Mechanic that we had to quit Pulpwood Barking, et al.

Facts are that the purchasing of the few machines which we did, was for purpose of educating people up and along Lines of the necessity, After having served that good purpose, we disposed of our machines, and to-day the rossing-peeling, and barking of Pulpwood increases to larger and larger extent, and that is what is desired for the market—Pulpwood outlined, and not with the Bark on.

**We are very glad to subscribe that your machines are doing very good work along Lines.** We are forwarding your letter to our C. E. & S. of M., S. B. Clement, North Bay, who may be enabled to furnish you further information and assistance of interest.

Thank you for the courtesy.

Yours truly,
J. L. Englehart,
Chairman.

Nushka Station, April 12th, 1915.

The Moreau Barking Machine Co., Ltd.,
Drummondville, Que.

Attention Mr. C. Manseau, Sales Manager.

Dear Sir:—

I must say that your machine is very good and we can easily bark 25 to 30 cords of four feet wood per day.

I have used several machines in the past, and I can certify that yours is the most satisfactory I have handled.

We have barked three hundred cords of pulp wood (128 cubic feet) per cord in eleven days.

Very truly yours,
(Signed) Joseph Perrault.

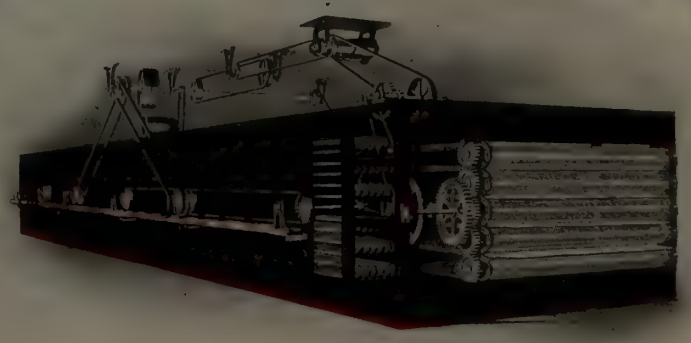
# DRYING VENEERS

is one of the most important operations of veneer manufacture. The old method of drying in racks is too slow, and requires too much floor space and labor for handling.

## THE "PROCTOR" VENEER DRYER

is an evolution of the rack drying method with the disadvantages eliminated. The "Proctor" Dryer is automatic and requires very little floor space, labor, and time for the operation. Veneer is dried by tremendous circulation of warm air.



**Send for Catalague 20 and list of eighty users.**

THE PHILADELPHIA TEXTILE MACHINERY CO.
PHILADELPHIA PA.

# The Steam Tension Band Mill

It is called the steam tension mill because the tension is maintained by steam—the most sensitive form of tensioning which has been devised.

The result of this is a great saving in saws—**several users of the machine have run through an entire season without cracking a single saw.**

But in addition to raising and lowering the top wheel by steam, there is a separate cylinder for operating the top guide, and these two cylinders make ours an entirely steam-operated mill, and, therefore, exceptionally fast.

It is made with 8 ft., 9 ft. and 10 ft. wheels, and will stand thorough investigation.

Write for bulletin and list of users.

## William Hamilton Co., Limited

### Peterborough, Ontario

**MILFORD LIGHT AND POWER COMPANY**

UNION SQUARE.

MILFORD, N. H. Feb. 9, 1915.

Graton & Knight Mfg. Co.,

Worcester, Mass.

Gentlemen:--

..... we have always found the service from your belts to be of the most satisfactory character.

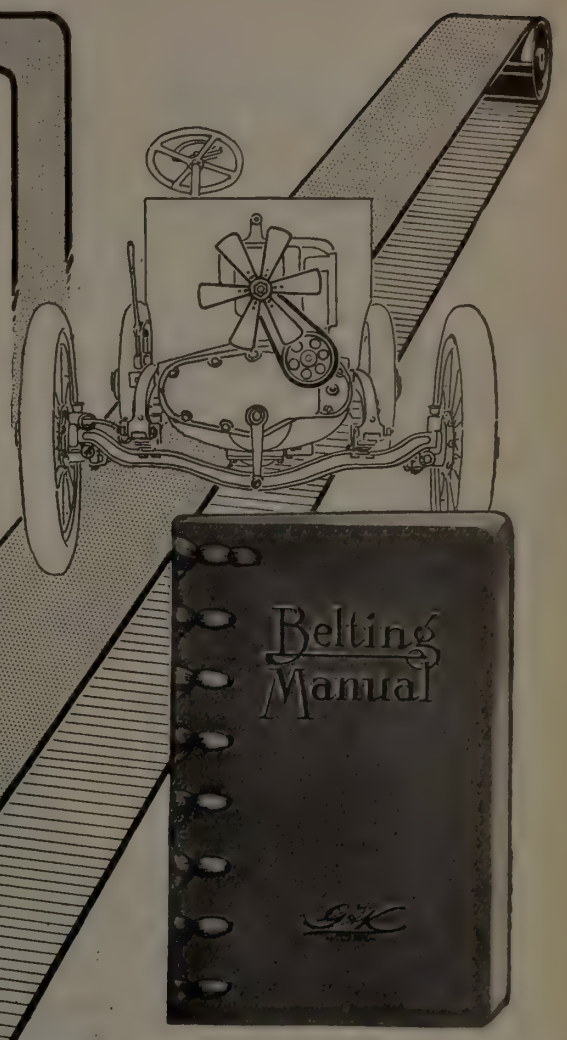
Very truly yours,

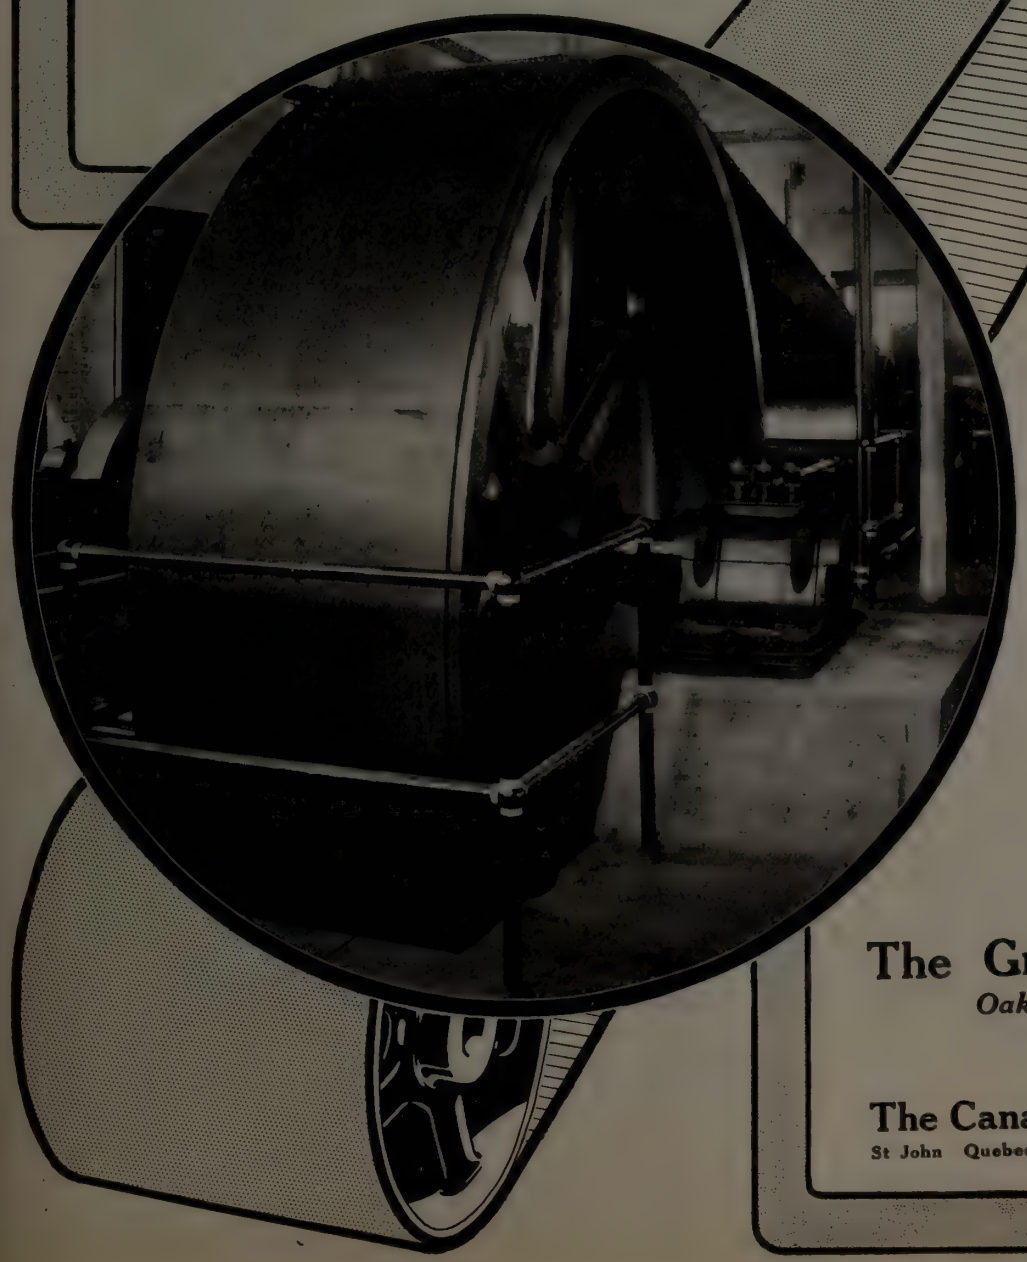
Milford Light & Power Company,

A.A.Murray Supt.

AAM/B.

Among other belts furnished these people is the 40" 3-ply Main Drive belt shown below, which has always given, as Mr. Murray says—"Service of the most satisfactory character."





The true value of a belt is determined absolutely by its service. When you buy a G & K belt—whether Main Drive, or the smallest Auto Fan belt—you always buy

# BELT plus SERVICE

because we have never swerved from our original purpose to produce the best leather belting possible—belting possessing the essential qualities of pliability, firmness with minimum stretch, great tensile strength and durability. Remember:—there's a G & K belt for every drive and its use means maximum service.

The "Belting Manual" tells how to select belts and how efficient service may be derived after the proper selection has been made. If you haven't a copy write us on your letterhead and one will be sent gratis.

# 128,350 Laths in Ten Hours

Our Lath-Mill and Bolter have made a test cut in ten hours of 128,350 four foot laths, 1½ in. by ⅜ in., counted, tied and piled, as will be seen in the following letter :—

**Five-Saw Lath Mill**

**Messrs. P. Payette & Co.,**
**Penetanguishene, Ont., Can.**

Dear Sirs,—I thought I would drop you a line and let you know of the record Lath-Cut we made on your machines on June 29th, 1910.

We made 128,350 four-foot laths, 1½ in. x ⅜ in., counted, tied and piled, in ten hours steady cutting from mill-run, and from slabs and edgings we had saved out, in order to keep the machines cutting their full capacity.

We used your No. 1 Four-Saw Bolter, and your No. 2 Five-Saw Lath-Mill, and had two Lath-Shovers and two Lath-Tiers, in order to keep up this speed.

This shows extremely well for your Lath Machines, not only for the tremendous cut, but they ran the full ten hours without a bearing getting hot or any stoppage whatsoever, and making first-class laths.

I therefore take great pleasure in recommending P. PAYETTE'S LATH-MACHINERY, to any person requiring up-to-date machinery.

I remain,
Yours sincerely,
**D. J. MacMILLAN**
**Lath-Maker for C. Beck Mfg. Co.**
**Penetanguishene, Ont.**

We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head-blocks; P. Payette's New Patent Saw-Mill-Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang-Circulars. Picket Mill Machinery.

Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.

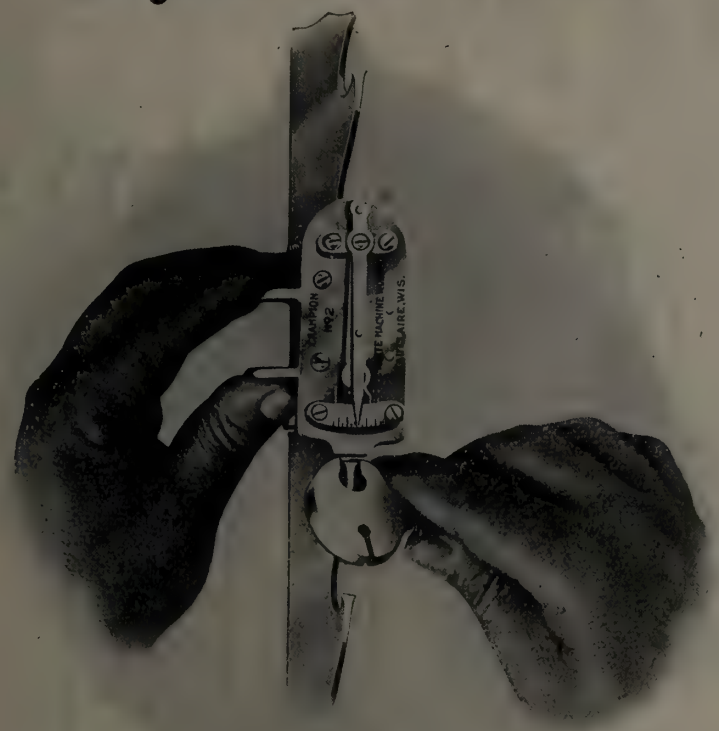
# A CHAMPION Saw Tooth Indicator

## will prevent most of your saw trouble



A great amount of your saw trouble is caused by defective teeth—uneven filing or irregular alignment.

These causes can be easily and readily detected with a Saw Tooth Indicator which works on either band or circular saws. It gauges both sides of a tooth at the same time; magnifies any defect twenty times, thus making it very easy to detect teeth which are only slightly out of line.

By the use of this indicator your saws will stand more feed and make a smoother cut.

Write for descriptive circular and prices.

JOHNS-MANVILLE SERVICE
COVERS THE CONTINENT

This Emblem connects your business with the Assets, Abilities and Integrity of a great national concern that has grown strong by growth from within. It is not merely a display sign for you—a trade mark for us; it is the symbol of J-M Responsibility.

## J-M Regal Roof Coating Goes a Long Way and Stays the Same Color when applied.

Sell your customers a roof coating that will not discolor from the oils in surface or saturation of their roofings.

J-M Regal Roof Coating is a **linseed** preparation—combined with other oils so that it makes a tough, elastic, durable coating that combines with the roofing and stays put! Will not scale or crack. Good for metal roofs, too. One gallon covers 100 to 250 feet, according to age and condition of roof.

Comes in six colors—in 1-, 2-, and 5-gallon cans, cases of 24, 12 and 6 cans, respectively.

Sells well, Pays well—Get Prices.

## J-M Elastic Roof Putty adds years to an old roof — but it won't make it new.

There is many a roof good for more service if the joints and flashings were painted up and the defective spots repaired.

J-M Elastic Roof Putty has been proved good by years of use. It retains the oils that give it life and will not dry out or run in hottest weather or break in winter. Ready sale for repairing cracks, nail holes and small defects in any roofing.

Comes in five colors—ready to apply and always easy working.

Useful, Saleable, Good Profit—ask for Prices.

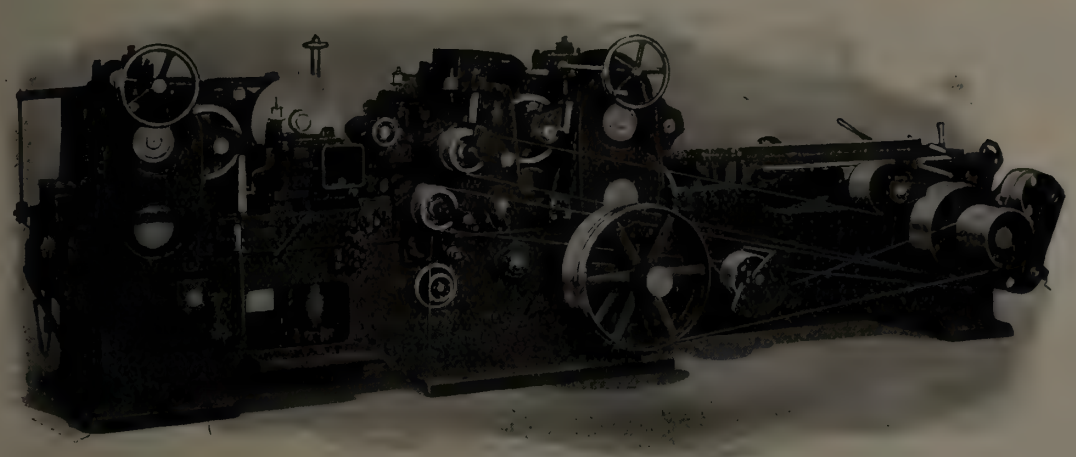
## The Latest and Best Hardwood Floorer is the

# American No. 77-A Model 5 Hardwood Flooring Machine



American No. 77-A Model 5 Fast Feed Hardwood Flooring Machine

**It will manufacture Oak Flooring of the very highest quality in all sizes at fast feeds.**

The American Automatic Feeding Machine is an essential part of an equipment when the highest capacity of the No. 77-A is to be obtained and desired. It handles the lumber with far greater precision than human hands could do, with a facility and rapidity really marvelous.

American Automatic Feeder

American Double-End Matcher

This machine will end-match the output of our No. 77-A Hardwood Flooring Machine. It is fashioned after the order of a double-end tenoner with chain feed and with a conveyor carrying the lumber from one section to another, making first the tongue end, and then the groove. Trimming saws are placed before the matcher heads so that the material is squared, defects cut out and the matching done at one operation.

**We furnish similar equipments for Maple Flooring and also for Yellow Pine.**

***Any Hardwood Flooring mill is far from being complete or up-to-date without the above equipment. Investigate.***

# Reduce Your Lumber Handling Costs

A Labor Saver That Saves You Money

For measuring lineal feet and board measure.
Made also for lineal measure only.

A Machine That Reduces Your Running Expenses

# Morrison Lumber Measuring Register

If you are paying a high rate per thousand for handling your lumber you are not making the profit you are entitled to. Wherever the Morrison Lumber Measuring Register has been installed the handling cost has been reduced to a minimum. One machine can tally more lumber per day than several men—and it never makes an error.

This Register can be attached to your planer, your sorting table or any other place you require, and will automatically and continuously measure your stock, giving the result in lineal or board measure as desired. It can be used for either filling small orders or for totalling the day's run.

Can be used in the saw mill, planing mill, or lumber yard, or anywhere you have a pile of lumber to measure.

Solidly constructed, nothing to get out of order, and guaranteed accurate in every detail.

Save time and money by using one of these machines. Already in use by leading lumber concerns throughout the country.

## OUR SLOGAN "SATISFIED CUSTOMERS"

## Don't Forget—because of its uniform texture—
## Arkansas Soft Pine is

# "Easy to Work"

When Dave, the contractor, ordered the material for the big barn he built this spring he neglected to specify ***Arkansas Soft Pine.*** The dealer failed to remember this customer's preference for ***lumber that is easy to work.*** The lumber supplied cost a little less than Arkansas Soft Pine would have cost.

**The contractor spent all of that "little less" and a great deal more, trying to make a good barn with lumber that was heavy, hard to cut and difficult to nail.**

***The Outcome***—This barn building enterprise was not the big and complete success it would have been had either the dealer or the contractor — both of whom are fully advised respecting the merits of Arkansas Soft Pine—remembered in time to order this bill from the right source.

***YOU KNOW, but do YOU always remember that your best customers want lumber that is easy to work?***

Contractors with dozens and dealers with scores of building enterprises on hand find it pays to remember to use Arkansas Soft Pine —lumber that is easy to work, that does not split when nailed, that holds paint and takes stain.

## *Guaranteees Satisfaction to all.*

# Tennessee Timber Lands for Sale

## BY J. N. LOTSPEICH, MORRISTOWN, TENN.

About 40 miles from this place (Morristown) and 12 miles from the railroad I have 5,235 acres of virgin timber; estimate below was made by one of the most reliable firms in the U. S. whose work is taken by the largest timber buyers in the country, and 10 per cent. must be added as this was made on 4,791 acres. Price, $18.00 per acre.

## FLORIDA TIMBER LANDS FOR SALE

**Tract B**—95,000 acres of virgin timber, 400,000,000 feet of Pine and 200,000,000 feet of Red Cypress, and 30,000,000 feet of Ash, Gum, Maple and Hickory. 50,000 acres of this tract is underlaid with Carbonate of lime, averaging 32 feet in depth and analyzing 96 to 98 per cent. lime. Water transportation from this tract to the Atlantic Ocean. Price, $18.00 per acre.

Adjoining this is 18,000 acres of similar land estimated to cut 55,000,000 feet of Pine and 10,000,000 feet of Cypress that would bring the whole tract within 4 miles of the railroad. Price $13 per acre. Terms, two-thirds cash, balance in one year with 6 per cent. interest.

**Tract F**—7,000 acres of Red Cypress, and four thousand acres of this tract is in fee simple, and in a solid body, 4 miles from the railroad and is estimated to cut 80,000,000 feet of Red Cypress and 20,000,000 feet of Pine, Gum and Oak. The Cypress is along a solid creek bottom that is from a half to a mile in width to the Pine woods. No better Cypress anywhere. The balance of this tract, 3,000 acres, is 5 miles from the 4,000 acre tract and is a 20 year lease for the timber rights. This 3,000 acres is estimated to cut 80,000,000 feet of lumber and is from one to two miles from the railroad along the river with deep water to the Atlantic Ocean, making it practical to manufacture the lumber from one mill site and have both water and rail transportation. Price for both tracts, $350,000 cash.

Description of 35,000 acres of virgin timber in Central Florida: 75,000,000 feet of L. L. Pine (Yellow), all large timber, 60,000,000 feet of White and Red Oak, being large size timber; 50,000,000 feet of Red Cypress, splendid size and quality as La. Red; 25,000,000 feet of Gum and Magnolia of excellent size and quality; 6,000,000 feet of Ash and Hickory, all good size and quality totaling 216,000,000 feet of saw-timber, which is estimated to be worth on stumpage basis $650,000, and the turpentine privilege is worth $100,000—thus making a value of $1,100,000—not including the small timber suitable for telegraph poles, cross-ties, and piling which is worth many thousand dollars. This land has phosphate on it but its value is unknown, as it has never been examined to determine its quality, but it is seen cropping out over the land. The soil is black loam and is level except it slopes from two to three feet to the mile to the gulf, some 7 miles from the southern portion of the property. Price for cash, $13 per acre. The tract is convenient to the S. A. L. R. R. and the Gulf of Mexico for shipping, and is less than 100 miles from Jacksonville, Fla. Will sell on time but the timber will not be removed till security is given for the deferred payments.

Also I have a tract of 21,795 acres of virgin timber in south Florida and after the timber is removed from the land it is well adapted to Citrus culture, vegetables and farming. This tract has been cruised and is estimated to cut 57,000,000 feet of Pine and 18,000,000 feet of Cypress, also will make 60 crops of turpentine. This tract is a solid body covering nearly an entire township and is located 6 miles from a town of 6,000 inhabitants, which is supplied with electric lights, waterworks, schools and churches. The business houses are built nearly all of rock and brick and is the terminus of 4 lines of railroads. This tract lies between two lines of railroads, one running one and one-half miles distant and parallel to it, the other running diagonally to the tract and three and one-half miles away to the nearest point in the road. The surrounding lands abound in Orange groves, vegetable and strawberry farms. The soil is a strong black nature, underlaid with clay and well adapted to Citrus culture and vegetables of all varieties. We give a conservative estimate of the land and timber as follows:

| | |
|---|---|
| **57,000,000 feet of Pine at $2.50 per thousand** | **$142,500.00** |
| **18,000,000 feet of Cypress, Red, at $4 per thousand** | **72,000.00** |
| **60 crops of turpentine at $100 per crop** | **60,000.00** |
| **21,795 acres at $5 per acre** | **109,000.00** |
| **Total conservative estimate** | **$383,500.00** |

At present this land can be bought for half of its value. Titles and abstracts furnished with deed. Price $8 per acre. This is said to be the best investment on the market in Florida.

**No. 207**—Description of 45,000 acres of timber located the very best on deep water, almost in a solid body, well timbered, will cut over 2,000 feet to the acre. One half of this timber has been turpentined and is ready for the sawmill, balance in virgin timber and can be turpentined while the other is being manufactured into lumber. The railroad touches this tract on one side and the Gulf on the other, thus giving water on one side and rail on the other for transportation. This tract is worth more for a cattle ranch or game preserve than is now asked for the whole land and timber, price at this writing $6.50 per acre. Titles good and terms, if so desired, two-thirds cash, balance in one and two years with 6 per cent. interest. This tract is an ideal location for a large city, the good land and water both warrant it. It has also fish and oysters close at hand, and is within 3 miles of the finest growth of Sponge to be found on the Gulf coast. The timber of this tract does not average large but it is a good turpentine proposition and will cut over 30 boxes per acre and is desirable for cross-ties—will cut from 40 to 50 to the acre, balance in timber, but if it should be desired for piling instead of cross-ties it will cut 20 piling to the acre from 30 to 50 feet to the acre in length.

## OTHER CHOICE INVESTMENTS OR OPPORTUNITIES

I have also a number of similar tracts of timber for sale ranging from 200,000 acres down. I have a very fine coal proposition in Ohio on the railroad and adjacent to coal lands now being worked. They are in touch with Washington City, Cincinnati, Baltimore and other large cities. There is ten million tons of coal back of 400 acres of this land that must come out over it. The price of this property is $35 and $40 per acre and parties familiar with it say it is a bargain at $50 an acre.

**Single copies 15 cents.**

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

**Vol. 35 Toronto, June 1, 1915 No. 11**

## Canada's Export Lumber Markets

Although the present issue of the Canada Lumberman is known as the "Export Number," and its pages are devoted almost exclusively to information regarding the export trade of Canada in wood and wood products, it is impossible to draw the line so definitely as to set on one side those Canadian lumbermen who are interested in export trade and on the other side those who are interested solely in the domestic trade. The lines overlap to a considerable extent from west to east. There is not a lumberman in Canada, even the smallest retailer in an out-of-the-way district who is not directly affected by the trade situation in connection with the export of lumber and timber. Every piece of lumber or timber which goes out of Canada today is taken off the local markets, rendering them thereby all the more steady.

Our capacity for production is far in excess of our consuming ability. Our industry has been established from the very first upon an export basis, having a capacity to cater for the foreign markets, and, with ordinary shipping facilities being able to carry on an export trade with considerable profit. Under these conditions the export trade is of equal importance, and we are inclined to beileve of greater importance to the industry today than is the domestic trade, large and important as the latter is. We feel, therefore, that in devoting all of our space in a special issue to export matters we are doing a service, not simply to those who are concerned in the manufacture and shipment of export stock, but to all lumbermen in every part of Canada.

During the whole history of the export lumber trade of Canada, the great outstanding feature of importance has been the shipping facilities available for sending our stock to export markets across the seas. The requirements of the trade in regard to shipping facilities have been almost invariably furnished in the past, but the shipping situation throughout the whole world was turned upside down by the present war. There exists today a great barrier between the mills of Canada and the export markets. On both coasts of Canada, manufacturers and exporting houses are seeking almost vainly for vessels to carry cargoes of lumber and timber. Prices that would have been considered fabulous a year ago are now being paid to the owners of vessels.

In British Columbia more than in the east, the shipping situation is critical. British Columbia is dependent today almost entirely upon the export markets for its welfare, even for its very industrial existence. In the past few years the export markets have been neglected in order to serve the markets of the rapidly growing prairie provinces of Canada. These provinces have grown beyond their safe limit for the time being and the trade has fallen dead, with the prospect of waiting a long time before it can revive to anything like its former proportions. The export trade is British Columbia's only available outlet today. It must be cultivated, or the industry must pass through a long period of financial readjustment with disastrous results. All lumbermen upon the Coast of British Columbia, therefore, and the British Columbia Government itself, are devoting their entire thought to this problem. Not only must ships be provided, but a system of handling export trade must be worked out which will make the British Columbia trade independent of the great commission houses at United States ports, and will also enable the manufacturers to make shipment under such conditions that the cost of producing the lumber will not be considered as secondary to the cost of getting it to market. Today the mills of the British Columbia coast are competing with one another for the privilege of securing vessels at high transportation charges. The situation should be exactly the reverse; the transportation companies competing with one another for the privilege of shipping the lumber. This is the problem which the Government of British Columbia and the lumbermen have to face. Upon it depends, first of all, the proper solution of the whole difficulty. Many other problems have to be worked out after this one has been settled, but it is of chief importance.

In Eastern Canada the same problems present themselves for solution, not in quite so critical a form as in the west, but still of great importance to the trade. In the east an interesting and at the same time picturesque, though only partial solution, of the shipping difficulty has been developed by the appearance of sailing vessels. The harbors of eastern Canada today recall the old times when the sole means of making shipment to foreign markets were the sailing vessels. As in the early days, our New Brunswick and Nova Scotia harbors, and even those of Quebec province are again alive with square-rigged ocean-going vessels, which, although slower, are wonderfully dependable, and have the added advantage of being, under ordinary conditions, cheaper than steam vessels. It is not impossible that the sailing vessel which had become relegated largely to the coastwise trade, will hold its place to a considerable extent as a trans-ocean vessel long after the conclusion of the war.

Altogether, the export trade in lumber and timber today is of wonderful interest and of critical importance. We have sought in the following pages to present it in all its aspects. Only a fraction of its features can be dealt with in the limits of this publication, but we feel that we have been able to prepare a series of articles of timely importance, giving our readers a good bird's-eye view of the whole export situation and presenting in definite, though brief form, a useful array of facts and figures from which to form a better idea of the extent and importance of the export trade, than they have been able to secure in the past.

---

Mr. H. H. Stevens, M.P., delivered an interesting address upon the lumber industry of British Columbia before the American Club of Vancouver, recently. At the conclusion of his remarks Mr. Stevens said:—"Now let me make a point that I think merits attention. The markets of the world are all now thrown open to British Columbia. What we need and urgently need, is facility for marketing. Three things must be considered in this respect. First, the business men of this province, recognizing that lumber is the basic industry, must lay their plans accordingly. Secondly, there should be co-operation of the heartiest descripton between the business men and the Government to the end that a well equipped brokerage system be established to market the products. In the third place—and this is important, mark you—there should be persistent advocacy of a fleet of ships to handle lumber shipments."

# The Export Trade of Canada in Wood Goods

Written specially for the Canada Lumberman By Edward Harper Wade

THE great importance of export trade is recognized alike by political economists and practical politicians. Every effort is made by all parties to develop and extend it, and however great the need for increased revenue may be, exports are seldom subject to customs duties. As imports must eventually be paid for by exports, and as the interest on borrowed capital can only be met in the same way, the ability to obtain goods from other countries, or induce the investment of outside capital, depends, in the last resolve, on the power to export such productions or manufactures as other countries require or can be induced to purchase.

Early in the commercial development of the Canadian Colonies the settlers looked for a market for the timber products of almost unbroken forests that then covered the country, and found it in competition with the woods of Northern Europe in the United Kingdom.

Edward Harper Wade, Quebec, P.Q.

### Beginnings of the Export Trade

New Brunswick and Nova Scotia were early exporters, as there are old records of large white pine mast pieces being shipped for the British Navy. Somewhat later on shipments were made from the Saguenay, but as the timber trade of the St. Lawrence developed it centred at Quebec, then the head of navigation, and private enterprise provided piers, mooring blocks and cove shipping booms to facilitate the business. The export timber trade had great difficulties to overcome before it attained its later importance. The intrinsic merits of white pine, by far the most plentiful wood, were only slowly recognized. Baltic whitewood and redwood, the equivalents of our spruce and red pine, were the building woods of England, commonly specified by architects in their estimates. In the early thirties spruce deals commanded a higher free on board price at Quebec than even the better qualities of white pine. In 1847 red pine, as being similar to Baltic redwood, and consequently capable of substitution for it, was worth nearly double the price of white pine in the raft at Quebec, and it was not until 1866 that red pine and square white pine sold at similar prices. For many years now the position has completely reversed. All prices were comparatively low, for ocean freights of the small sailing vessels then engaged in the trade were high compared with Baltic rates, and marine insurance, on what was then considered the dangerous St. Lawrence voyage, was relatively costly.

The earliest available price records are those of 1847, being for timber in the raft at Quebec, and for deals piled at the mill. They are given in the old Canadian currency, as it was long afterwards that Canada assimilated her coinage to that of the United States, but following prices are equivalent values per cubic foot for timber and per thousand feet B. M. for deals:—

White pine 5.00 to 8.33 cents, red pine 10.00 to 15.83 cents, oak 23.33 cents, elm 8.33 to 13.33 cents, ash 6.67 to 10.00 cents. First quality white pine deals $13.09 to $13.82. Second quality $8.73 to $9.21. In 1912 prices had attained their highest level, having experienced many fluctuations. The prices then current are a striking contrast to those of 1847.

White pine square 30.00 to 55.00 cents, waney 80.00 to 93.00 cents, red pine 35.00 to 40.00 cents, oak 65.00 to 73.00 cents, elm 65 to 93 cents. First quality white pine deals $65.45 to $80.00. Second quality $40.00 to $47.27, and third quality $21.82 to $29.09.

All white pine timber was well squared till 1861, when waney pine with a wane of four to six inches at the corners was first manufactured. Its selling price in that year was equal to 13.33 to 18.33 cents per cubic foot.

### Early Trade a Profitable Venture

Presumably the trade in its early days was profitable to producers and manufacturers, or it would not have continued. This can only be accounted for by standing timber being then readily accessible and of no appreciable value. Wages were very low, as there was little money in the country and no accumulated capital. It is a strange fact that when prices were at their lowest, Canadian wood goods had a tariff preference in Great Britain, which was afterwards withdrawn without the anticipated disastrous results, for the trade not only survived the change, but prospered in spite of it.

In July, 1896, the first Ottawa raft of square timber arrived at Quebec, and by 1815 the timber trade of the Ottawa was firmly established, but before Ottawa rafts came down at all, the white pine of Lower Canada was hewn into square timber and shipped to England. The white pine forests of the Maritime Provinces and Lower Canada were not speedily exhausted, though more timber was destroyed by fire than by the axe. Less than fifty years ago St. John, New Brunswick, shipped considerable quantities of high grade white pine timber to Liverpool, England, and as recently as forty years ago the sawmills round the harbor of Quebec were busily employed cutting up white pine sawlogs into deals for export. Even now sawmills at Three Rivers still cut some white pine deals from St. Maurice sawlogs. The export trade found a new market, and was gradually diverted to the United States, consequent on the growing demand from that country caused by the depletion of its forests and the larger consumption resulting from increased population. Canadian home consumption also by degrees became an important factor. The consequent advance in the value of white pine obliged the British consumer to restrict its use to a few special purposes and substitute cheaper woods. From Montreal a portion of the production of Ottawa and western sawmills is still exported to the Unied Kingdom in the form of sidings, board and deals, and with prices very different to those of years ago, the value of the reduced export is yet quite considerable. This business is done by shipping parcels as part cargo in the steamers of the various lines that trade from Montreal. Formerly the shipments were made by sailing vessels only from Quebec, and consisted largely of hewn timber. In 1912 the export of timber from Quebec had fallen to a little over two million cubic feet, principally part cargo shipments in a limited number of steamers, and a sailing vessel is now rarely seen in the harbor. In 1845 no less than 1475 ships averaging 380 tons register loaded at Quebec. In 1865, twenty years later, 1,021 ships, averaging 633 tons register, took timber and deal cargoes there. In 1861 out of 1,364 ships loaded, 1,148 were British, but later on Norwegian vessels, many of them transferred from British ownership, formed the bulk of the fleet, but with the change from sail to steam the British flag again predominated. The earliest available Quebec records are for 1845 and show a shipment in that year of equal to nearly four hundred million feet board measure, of which about three-quarters was square hewn timber, principally white and red pine, but included eighty-eight million feet of pine deals and about fourteen million feet of spruce deals, showing that a large and active sawmill industry existed.

### In the Days of Sailing Vessels

In the old days sailing vessels came up the St. Lawrence, and sometimes, with a favoring east wind, fleets of sixty or seventy vessels under full sail, rounded the first point in Quebec harbor, to drop anchor and put ballast overboard before proceeding to their loading berths. The loading of these vessels gave employment to an army of timber towers and ship laborers, while putting in order and shipping the timber that come down the river in huge rafts, made the coves busy hives of industry. Saw mills at various points round the harbor employed many men, and small tugs towing timber and batteaux taking deals and staves to the ships, made a busy scene. Such was Quebec as some still remember it, but the glory has departed and now a sailing ship is seldom seen and the shipping coves are generally disused, deserted and desolate.

The United Kingdom has gone back to her old sources of supply in the Baltic, and forty-eight per cent. of all the hewn and sawn timber imported into Great Britain in the year ending 31st of March, 1914, came from Russia. A new competitor with white pine has arisen in Kedr, or Siberian pine, shipped from Vladivostok in waney logs, deals and sidings, which can be delivered in the higher grades at a much lower price than white pine, and has largely gone into consumption as a substitute.

Interesting as ancient history may be, it is the present and the possibilities of the future that claim the attention of business men. Our predecessors fought a long and hard battle to build up the business of Canada, contending in the export trade with prejudice in favor of better known woods, and with the disadvantages of high freights

and heavier insurance, but they succeeded and laid the corner stone of the present wealth and prosperity of Canada.

### Opportunities of the Immediate Future

Business changes come and must be met. If Canada is not only to maintain her export trade, the acknowledged basis of business prosperity, but extend it to the utmost possible limits, her producers and manufacturers must look well after all possible openings in old and new markets. Possibly the present war offers opportunities that may never recur if missed. All forecasts of the possible duration of the war are merely guesses or conjecture, but its continuance is certainly disorganizing the wood trade of Russia and Sweden, and it will be some time after the declaration of peace before that business will resume its old position. When hostilities cease the demand for reconstruction purposes will be great, and United Kingdom stocks, now being rapidly depleted, will need replenishing. Germany controls the Baltic, so interfering with the Swedish supply and stopping shipments from Russian Baltic ports. Present freights specially affect long voyages, and this stops for the present a continuation of shipments from Vladivostok. The Russian port of Archangel, when navigation opens, will be congested with business, and short of labor. Box making, packing case and building material will certainly be required. The railways of Great Britain will soon be short of ties or sleepers, and must get them from some source. The coal mines of England and Scotland annually consume about four and a half million tons of pit props. Russia was the chief source of supply. During the year preceding the war Great Britain imported from Germany paper to the value of over six and a quarter million dollars. Here is business that is worth looking after, and there are doubtless other openings. There are timber brokers in London, Liverpool and Glasgow ready to look after consignments or arrange contracts. There are export merchants in Quebec unusually keen for extended business. Railway companies, working in connection with Montreal steamship lines, can quote through rates from point of loading on cars to port of delivery in the United Kingdom.

Such is the position the present or possible producer and manufacturer has to consider, and if possible develop.

## Made in Canada

"Let us be an independent industrial Canada," exclaimed an eloquent member of the parliament of Canada, speaking recently in the House of Commons, "let us feel and know that if the whole world was excluded, if there was a wall fifty feet high around Canada, we ourselves with our resources, our capabilities, our population, could go on and thrive, interchanging our products one with the other and so securing a prosperity **that would be tantamount to perfection and absolute balance.**" In the palmy days of Chinese exclusiveness, when the Great Wall was built and trade with "foreign devils" prohibited on pain of death, the Emperor Ming would probably have presented the author of the above sentiment with a monkey's tail and three peacock's feathers, plucked from its brightest part, as a mark of intellectual distinction. There is every sign of the times that the Emperor Ming's views on political economy and foreign trade are highly popular in Canada at present.

The passage quoted above forms part of a panegyric in support of the Made-in-Canada movement. Preposterous though it is, it can be duplicated over and over again by a reference to the current columns of the press and the political speeches of the day. The streets of Montreal are placarded with a picture—a most moving picture—of a sorrow-stricken workman and his martyred wife—brought to ruin by the folly of their fellow-citizens who will not buy the things they make. It is not stated what it is that they make. It is very probably boots. It is not stated either why it is that the people will not buy them. But one can easily guess.

Up to the present time no one has yet drawn a set of pictures to represent the economic consequences that would follow if the Made-in-Canada movement obliterated foreign trade; the ruined home of the transport worker whose job has ended when the ocean steamers abandoned the port of Montreal—the wholesale importer driven out of business by the prohibition of trade in English goods, his afflicted clerks clinging about his knees and asking vainly for a crust of bread—the Canadian farmers—or no, let us say, the whole population from Winnipeg to the Rockies, sitting in rags and misery with a huge heap of unsold wheat beside them which they cannot eat and which they must not sell. For it never occurs to the Made-in-Canada propagandist that if a country does not buy then it cannot sell. Our exports are sold in the first instance for money, but sooner or later and in the long run, goods are exchanged for goods. To go on for ever sending out wheat and bringing in gold is an economic impossibility. Even the Emperor Ming saw that.

The truth is that the workers who are busy with the transport trade and the import trade and those who are working on the farms, together with all those who are teaching school, preaching the gospel and training for the war, are far too busy to run round placarding the walls of the cities with mimic pictures of imaginary distress. Show me a man who puts up a Made-in-Canada placard and I will show you a man who hopes to increase his own private and personal profit, at your expense and mine, out of the movement.

Protection to industry is one thing. We have it already. We are not proposing to change it. But when a manufacturer in an industry already protected to the extent of twenty, thirty, or forty per cent raises a clamour for the exclusion of foreign goods, the thing passes from protection to plunder. The proper answer to such a man is to throw at his head a militia boot with a paper sole and a hole in the side.—S. L., in University Magazine.

## An Expert U. S. Opinion on the Export Outlook

By R. M. Gates

No business in this country suffered more from the war than the lumber industry. No business will prosper more when peace comes than the lumber industry. That is the conviction of experts in the United States Department of Commerce. The world never saw the like of the destruction of human habitations in the war zone from the vicinity of Warsaw, in Poland, to the environs of Paris. Not only have houses, bridges and everything else in which wood is a material been destroyed, but vast areas of forests which had for centuries been conserved have been razed and so denuded that it will require a long time and an enormous requisition upon the lumber resources of the world to reconstruct the waste places. . . . . Every stick of lumber will be in demand at a good price. Indeed, there is apprehension among those who look to the future here that the high prices readily to be obtained for lumber exported from the United States will seriously impair the stock in this country and that to prevent it the government must take drastic measures for conservation of its own resources in this respect. There will be a demand for all kinds of building material when peace comes, is the word. It will include not only lumber, but iron and concrete. The assured future of cotton needs no effort to persuade as to its destined restoration to its ancient throne, but the item of rebuilding homes for the war devastated region of Europe is the biggest thing for the lumber producing countries of the world they have ever known.

During the month of April, 1915, the timber sales of the British Columbia Forest Branch amounted in value to $19,799. This covers 10,706,337 feet B. M., 3,500 lineal feet and 1,900 cords. The quantity of timber scaled in British Columbia during April was 39,129,127 feet B.M., of saw logs, 364,477 lineal feet of poles and piles and 12,813 cords of ties, shingle bolts, fence posts and cordwood. The total exports from all districts of British Columbia, reported by the Forest Branch, amount to 5,562,815 feet B.M.

## Credit Bureau an Advantage to the Whole Trade.

Pittsburgh, Pa., May 20th.

Editor Canada Lumberman:

We have just had put on our desk your issue of May 15th and note your editorial in connection with the Toronto Trade Credit Bureau. At this distance, we are not familiar with the situation in your city to any great extent, but it strikes us that this move is a big step in the right direction, and we sincerely hope that your trade can push this move through. We only wish we had such an organization on foot and in operation in this city. We cannot but believe that this organization, if successfully worked out, will be a wonderful advantage to the lumber trade, both wholesale and retail, as well as to the ultimate consumer and the original manufacturer. It will not only be an advantage to Toronto, but its certain good effects will be felt as far south as Pittsburgh.

The proposition, we believe, is the only successful weapon to eliminate the unsatisfactory elements, and materially build up the desirable business relations. There are, we understand, similar organizations in other lines of business and why not have it in the lumber business, the biggest of them all?

We hope to read in your next issue that the formation of this Bureau has been completed and for an early start of a similar move in Pittsburgh and all other good cities.

Yours very truly,

E. H. Shreiner Lumber Company.

# Export Markets—What They Mean

## Lumbermen From East to West Tell of the Opportunities of the Foreign Trade

### Should Export More Dressed Lumber

Editor Canada Lumberman: Bathurst, N.B.

At the present time, if we had the freighting facilities for carrying lumber, there would be no trouble at all in doing business with a great many countries that heretofore we have never been able to touch. France is now looking for lumber here and Belgium will be in the market very shortly, but the great country that we should be supplying very large quantities of lumber to at the present time is Great Britain, but owing to lack of tonnage, it is impossible to ship our lumber. The freight rates have advanced about 400 per cent., but in spite of this, the vessels are refusing to take lumber, claiming that other freight is paying them very much better rates. The fact is that practically all the line vessels today will not take any lumber whatever and it means that all the lumbermen are being badly handicapped for want of vessels to carry their freight.

**There is one item, however, that might be gone into very successfully by more Canadian lumbermen than is the case at the present time, and that is the shipment of dressed lumber.** Heretofore, practically all our shipments from Eastern Canada have gone forward to Great Britain and all other points, in the rough, and we believe that the time has come when the Canadian lumbermen should equip all their mills with dressing plants and, as much as possible, ship a finished article, thus increasing our working forces at home and giving more employment to laborers. **At the present time there are a number of openings in Great Britain for dressed lumber, and we could ship large quantities of this today, if we had the facilities for carrying it forward. Our opinion is that the thing to do now is to agitate and see what can be done to provide vessels for carrying lumber.** If your paper can do anything to give us some help on this point it would be very much appreciated. There is a great call for lumber in the rough and also for dressed lumber today in England that we could supply if we could get it to the market.

If we dress our lumber here, not only would it mean increased employment for our home laborers, but it would mean considerable in carrying capacity for the vessel, as a vessel could carry probably 15 per cent. more lumber in the dressed condition than it could in the rough.—Angus McLean.

### Markets for Hardwood Products Should be Extended

Editor Canada Lumberman: Gibson, N.B.

I think it undesirable to stimulate the cutting of New Brunswick spruce or pine trees, as our forests are already being depleted faster than is prudent; but **it would be highly desirable to extend our markets for hardwoods such as birch, beech and maple and the manufactures thereof, such as furniture, chair stock, handles and small articles that will utilize the waste.**

The frequent trade inquiries asking for connection with Canadian manufacturers of handles, and other hardwood articles, show the demand is active, and I think these opportunities should be seized by those who are equipped for such manufacture and thus pave the way for development of permanent business.

So large a percentage of each hardwood tree is left in the woods, and so large a percentage of each hardwood log that is hauled to the mill is waste, that it is doubtful if more than one-third of the growth is being utilized, and I think cutting of logs less than twelve inches in diameter cannot be made profitable unless the waste can be disposed of to advantage.

**The Canadian Government has lately published many inquiries for handles, veneer or ply wood, chairs or chair stock, furniture, dowels, clothes pegs, closet seats, butter boxes, washboards, and beehives.. Treenails, bungs, fruit boxes, taps and many other articles could be sold if economically manufactured.**

The location of small plants for the manufacture of wood alcohol, charcoal and by-products near the source of supply would use all of the limbs and tops and even the roots if they could be made available. The greatest difficulty in this would be the transportation of charcoal, but this can be overcome in many localities.—J. B. Gregory, Manager, York and Sunbury Milling Company, Limited.

* * *

### Should Study Consumers' Wants More Closely

Editor Canada Lumberman: Halifax, N.S.

**With regard to the development of export trade, if our lumbermen would take the matter more seriously and endeavor to supply the exact requirements of receivers, the business could be worked up to very much larger dimensions.** Of course, in the large New Brunswick mills, and practically all the Quebec mills, they go in for sorting and marking the stock, similar to the manner in which they handle the business in the Baltic, but in Nova Scotia we are behind them in this respect, but things are improving all the time. Of course, there is a large demand from France for spruce deals, but this means cutting metrical lengths, but as the market for ordinary English lengths is so excellent at present, it is almost impossible to get any manufacturers to entertain metrical lengths just now, especially as the French market does not offer any special inducement in the way of price, up to the present at any rate. Of course, the war has produced a number of extra outlets for our woods. I have shipped a quantity of hemlock sleepers 9 ft. 10 x 5, and they seem to be giving satisfaction, but the buyers insist on these being split through the heart, and strongly object to the sleepers having any heart in the centre, but want the heart on one face. I am going to do my best to hang on to this trade, but I am afraid when conditions go back to normal that it will go back to the Baltic again, as, although the price I have been getting is only an ordinary one, the people complain about it being high, but, of course, we may continue to hold some of the business for some time yet.

The pit prop business has not turned out as favorably as expected, from my own personal experience. I have shipped quite a quantity, and had satisfaction to start with, but recently I find buyers becoming very critical, and I have had to suffer claims, but at the same time I am willing to admit that there was some just cause for a part of the claim, on account of small diameters at the top. I still have cables saying they will take more stock, but with the freight situation where it is now, business is impossible, as on the present deal rate it means a freight rate of about 170s. per fathom! There is a vessel now loading here with fire wood and poplar logs, shipped by the Swedish Company at Nordin, N.B. As far as I know, this is the first cargo of this description to be shipped from Canada. The Baltic previously had the fire wood business practically all to themselves. Fire wood, of course, covers small trimmings and ends, 1-in., 2-in. and 3-in. thick, from one foot to three feet long, which as a rule is generally wasted in our mills.

The box board business is, of course, one in which the Canadian mills have been interested for some time, but no doubt it will receive a great filip owing to the war conditions.—Colin C. Tyrer.

* * *

### Nova Scotia Should Seek Export Markets for Hardwood

Editor Canada Lumberman:

We are exporters of spruce lumber, to some extent, for the River Plate market, but we usually sell to commission men in the United States or England. As, however, Nova Scotia furnishes quite a large number of cargoes for that market, it might be worth while for some effort to be made by the manufacturers to establish an agency of their own, and perhaps by doing so save middlemen's profits, and also increase the volume of the trade.

We have no pine in this section of Nova Scotia worth speaking about, but there are a great many millions of feet of hard woods—mainly birch and beech—for which, so far, no profitable market has been found. **We think it likely that if some effort were made in the direction of marketing these hardwoods in foreign countries, a more profitable use could be made of them than that which now exists, viz., the cutting of them for firewood.**—Nova Scotia Exporter.

* * *

### Cape Breton Exports Increasing

Editor Canada Lumberman: Sydney, C. B.

Cape Breton, in the past, has not been a lumber exporting section of Nova Scotia, but on the contrary has imported much lumber during the past fifteen years from other parts of Nova Scotia and New Brunswick. Conditions are changing and Cape Breton is now producing much more lumber than it has, and every year the production seems to be on the increase, and importations, while not so large as in the past, are still quite heavy, as the Cape Breton lumber is generally small.

We are now loading half a million feet, chiefly 2 x 4, for Boston. This is planed on one edge, freight is $4 per M. and insurance is 1½ per cent. under deck and 4½ over deck. Price to net the shippers from $16 per M. and better.

We may here say that we are the first shippers of lumber from this port to the United States, our first consignment being laths to New York, two years ago. We expect to ship several millions of lumber this season—Chappell Bros. & Company, Limited.

* * *

### Tonnage Famine Preventing Shipments

Editor Canada Lumberman: Bathurst, N.B.

Practically everything we manufacture from Bonaventure is sold for export. Usually we manufacture about 5,000,000 feet of deals at our Bonaventure mills, and these are practically all exported to the British market. **We have sold our output from that plant for this year to a large exporting Canadian house, but they have so far failed to secure any tonnage whatever to move the cut of the mill.** We would not be at all surprised if the cut remained on our hands over there all summer and possibly was carried over till the spring of 1916 before shipment can be made. This is, of course, owing to the extreme

scarcity of ocean tonnage. The situation does not seem to be improving very much. Tonnage is still very hard to secure and we see very little prospect of any improvement in the near future.

The question of developing our export trade at the present time is, of course, entirely a matter of tonnage. The lack of tonnage is a very serious thing for mills that are located where they only have water shipping facilities, such as our Bonaventure mill. This scarcity of tonnage is going to put all the mills in a very bad way and cause a serious loss to the lumber manufacturers who are located this way. It may possibly entail the closing down of their plants in mid-summer, as they cannot continue to run and pile up the lumber all summer unless they get some relief in the way of having shipments made.

There is no question at all about the export trade being of great benefit to the lumber manufacturers all through Eastern Canada. It is, of course, the hope of the trade at the present time, but unless we can get the facilities for taking care of the export trade, we are not able to take advantage of the present opportunity of getting into that business.—Bathurst Lumber Company, Limited.

* * *

### Discrimination Against Canadian Lumber of Selected Grades

Editor Canada Lumberman: Sussex, N.B.

**It is a notorious fact that the British importers—be the cause whatever it may—continue to place an embargo on special quality in either hardwood or spruce shipped from Canada for the manufacture of furniture, pianos, aeroplanes, and all such trade, demanding very high quality and a standard dependable grading.**

Canadian manufacturers can only see two causes for this, neither of which are valid or sufficient, and could and should be easily overcome, if shippers and importers would get together and consider the facts.

Established custom, we mention as the first of these causes. As usual, this plays the greatest part. Materials in selected grades of birch and spruce have been continuously imported from the United States, and the American Associations have standardized a grading, and monopolized the trade, keeping the importers persuaded that Canada lacks the quality, and is not capable of proper grading.

In the second place, the naturally high quality of the forest production of Canada, and the ability of manufacturers to select the product, is kept in the background because of the failure on the part of Canadian manufacturers, due to their more limited numbers, to associate themselves and take the buyers by storm, according to the American method. This has allowed the British importers to overlook the great Canadian supply of superior quality selected lumber. This is a matter of regret. Possibly we should not blame the busy importer for not first making sure he cannot get at least as good material within the Empire before going outside. **But, at this time, when the Empire should co-operate in matters industrial as well as military, we, as Canadian manufacturers, think that at least the military aeroplanes manufactured in such numbers should be made from Canadian lumber,** wherefor a great supply is available of as high quality as any obtainable in the United States.

The American rules for grading lumber are accessible to Canadian mills, and it is very easy for shippers to get Americans who have graded this lumber for years, to do the selecting for any importers who fear that the Canadians cannot properly follow the standardized American rules.

Considerable stock is being shipped to the United States ports of Portland, Boston and New York, and from there re-shipped to Great Britain at a great additional expense in freight, simply because it is known that if such stock were shipped from any port of Canada buyers would be prejudiced against it.

**As representing Canadian manufacturers, we wish to appeal to British importers for a chance to supply the materials above referred to,** and hope that these few words may cause serious thought, and that results may follow in the way of establishing trade hitherto denied to the various industries of our glorious Dominion of Canada.—Charles T. White & Son, Limited, Specialists in selected clear spruce, birch and maple.

### Prefers United States to English Market

Editor Canada Lumberman: Montreal, P.Q.

Some years ago we manufactured all our spruce logs into 3-in. deals for the English market at our Charlemagne mills, and I used to go over in the winter and sell what we produced, but for the past seven or eight years we have given up the cutting of our logs into deals on account of the low prices that were offered in the English market. **We could realize more money out of lumber by cutting it into suitable sizes for the United States and home markets.** So far as the market is concerned, you can always get one in Great Britain, but you can never depend on it for prices.

Our spruce comes into direct competition with stocks from Sweden, Norway and Russia, the last named country being the worst competitor. These three countries can sell spruce deals cheaper than we can. One reason is that in ordinary years their freight rate is only about half (from their ports to Great Britain) what it is from the St. Lawrence over, and also their labor is much cheaper than ours.

We prefer the United States and home markets in ordinary times. This year, of course, is an unusual one on account of the war. Shipments are almost prohibitory from Sweden and Russia and nearly all the spruce manufacturers on the St. Lawrence and in New Brunswick are cutting for the English market this year.—A. MacLaurin.

* * *

### Better Transportation Needed and Lower Freight Rates

Editor Canada Lumberman: Great Salmon River, N.B.

Improved transportation facilities and more favorable freight rates are of the most pressing importance for the development of the lumber industry. The large amount of splendid hardwood in the forests of the Maritime Provinces, which has been as yet hardly touched, it would seem should be brought into the market. There are doubtless many other matters of importance in this connection, but these matters have especially impressed themselves upon us.—Pejepscot Paper Company.

* * *

### Greater Export Trade of Incalculable Value

Editor Canada Lumberman: Owen Sound, Ont.

I do not think I have sufficient knowledge of the situation to express an opinion worth printing about the possibility of increasing our export trade in lumber and wood products, as our company's export trade has been developed along special lines, and principally on specialties.

Your second question is worth more than passing attention, as the value of export markets for many things besides lumber is incalculable.

In developing a new country like Canada, stretching over such vast distances, with the demand of every municipality for up-to-date methods of transportation, sanitation, public buildings, etc., it is natural for us to tax the future in the shape of huge loans which must ultimately be liquidated, and on which interest must be paid. There are only two methods of paying, one by exporting goods and the other by exporting money.

If the trial balance of a nation were kept in the same way as that of a corporation, the folly of restricting our exports would at once be visible, and more united efforts would be made to liquidate a greater proportion of our indebtedness in goods manufactured as well as in crops grown.

For instance, would a corporation allow a $200,000,000 trade balance in favor of the United States to occur year after year without taking stock of the situation and devising ways and means to settle in goods instead of cash?

Any restrictions that interferred with exporting goods would go by the board quickly. Every sales agent of the corporation would be impressed with the desirability of meeting that train of gold with goods, and the head of the corporation would not rest satisfied until that result was accomplished.

In effect, we, **the exporters, are the sales agents of the corporation of Canada. A due regard for the welfare of our country or corporation should spur everyone to make every effort to sell abroad, as nearly all Canadian products, either raw or finished, can be replaced without trouble.**

This is especially true when we have an over-production of lumber, as nothing but exportation can put the market in a proper condition, except time, which is a slow process.

Incidentally, it is up to the corporation, " the Government of Canada," to find bottoms for delivery. Our company is unable to secure any except at a prohibitive rate, as ocean freights have jumped from 15 to 60 cents per 100 lbs., and the English market cannot stand the increased price, and even at increased rate delivery cannot be guaranteed.—Keenan Bros., Limited.

* * *

### Tonnage Problem All-Important

Editor Canada Lumberman: Ottawa, Ont.

It is a well-known fact that the British trade is taken care of by representatives of British firms, scattered throughout Canada, who take delivery of the lumber f.o.b. cars, or boat, at point of shipment. This has worked out very satisfactorily for the Canadian manufacturer.

On the other hand, there is the export trade to South America, West India Islands, South Africa, and other foreign countries, which really is a trade in itself, and we do not believe that one manufacturer in ten is situated to take care of an export business, in the way of grades, sizes, lengths, etc. The lumber for that class of trade has largely come from Canada in the past, and is handled by two or three large exporters, who have spared no expense in the way of equipping large sorting yards at central points, where the lumber is brought from different parts of the country, and sorted up into grades, lengths, and sizes, to suit the particular trade for which it is destined.

In the writer's humble opinion he would say that **the first problem to be solved would be to secure tonnage to move lumber that is already sold and paid for, and still on sticks in the manufacturers' yards.**—Shepard & Morse Lumber Company, per P. C. Walker.

* * *

### Ocean Freights Preventing Trade

Editor Canada Lumberman: Ottawa, Ont.

**We have shipped two carloads of doors to the Old Country in the last month and have several more orders on our books to ship, but cannot do so on account of the high ocean charges.** In shipping the two carloads of doors, we took a chance on what the freight would be as we were unable to get a rate from the steamship companies before shipping. We found after receiving a

bill for the ocean freight, that we were charged exactly five times what the ordinary freight should be under normal conditions.

We have been trying of late to get a rate from the different steamship companies for the orders we have on hand now, but have been unsuccessful in getting same, as they do not care to handle any freight whatever, that is speaking of the Cunard and White Star lines. We presume their reason for this is that they are booked so far ahead with war material that is being shipped by the Government, with the result that it is making these steamship companies very independent.

At the present time we have this matter of ocean freight rates up with the freight department of the Canadian Manufacturers' Association to see if they cannot get us a redress on freight charged us by the steamship company for the two carloads of doors already shipped, and to see if there can be a readjustment of ocean freight rates.

**We know that there is good export business for us in the Old Country by the orders we have now and could get, if only we could get fair ocean rates,** and there is no use trying to boom export business until there is a readjustment of ocean freight rates. The way the rates are now it is impossible to export.—Estate James Davidson.

* * *

### United States Conditions Regulating Our Trade

Editor Canada Lumberman: Toronto, Ont.

I believe a revival of the export trade would tend to stimulate activity in Canada. This view is in harmony with the history of the trade for the past thirty years. **I believe, however, that it is to the improvement of the United States trade that we must look for a betterment of conditions in the lumber trade in this section of Canada.** So far as exports to the United Kingdom and France are concerned, it is understood that already many of the New Brunswick and Quebec mills have made contracts, covering their export for the coming season. This will help the situation so far as Ontario is concerned by cutting off the competition of Quebec and New Brunswick spruce with Ontario spruce. The British and foreign export trade calls for special sizes, lengths and grades, which can be best produced at mills that are close to tide water. Interior mills, having to rely upon the Canadian or United States market for the disposal of the largest part of their product, cannot successfully enter into competition with the tide water mills. Besides, they are handicapped by the high freight rate to shipping points. As it is, it is probable that abnormally high ocean rates will prevail during the coming season, and a foreign market can only stand these excessive charges because sources of supply nearer home are cut off.

To sum up, I repeat that improvement of the lumber trade in Ontario will come mainly through the withdrawal of eastern stocks from competition and an increase of trade with the United States.—John Donogh.

* * *

### U. S. Bending Every Effort to Foster Export Trade

Editor Canada Lumberman: Chicago, Ill.

Commenting first on the letter of Edward Harper Wade, of Quebec: American lumbermen are considering this same problem, and are very much in earnest in their efforts to find a method for developing new and greatly extended markets for their forest products. This they will attempt to do through various forms of "collective effort," which will include plans to coordinate their efforts in developing export trade, and in diversifying the character of such exports. It will also include, as fundamental, co-operation with financial institutions and the federal government and the transportation companies. It may also involve the acquisition or development of a merchant marine, and co-operation with all other lines of business seeking export markets, in order to diversify and distribute the largest possible amount of products at a minimum of overhead expense. It will also include, of course, the financing of foreign loans and accounts.

The federal government is very earnestly in favor of this development. The new Federal Trades Commission is especially charged with the duty of fostering and aiding it in every practicable way. The government's ship purchase bill was defeated because that particular plan was considered inadequate and undesirable by the business interests.

**The determination of the business men of this country to enter the field of foreign commerce is developing with great seriousness.. To speak candidly, as I think I ought to do at your invitation, I think this attitude of mind is a distinct obstacle to Canadian development.**—Geo. H. Holt.

* * *

### Grading Troubles Restrict Exports to United States

Editor Canada Lumberman: Buffalo, N. Y.

We would be very glad to write you a letter in regard to our experience with Canadian trade, both buying and selling, but **the burden of our remarks would probably be in criticism of the grades that the Canadian producers are shipping and that the Canadian consumers are taking. Suffice it to say that we have considerable trouble with the grades on lumber bought from Canadian mills and we also find that the consuming trade there seems to be satisfied with an inferior grade which to a great extent works us out of the market,** for we refuse to ship any stock unless our invoice shows the exact grading of the consignment. We do, however, sell wholesalers a good many cars which go up into Canada.

To get down to concrete examples in buying lumber from Canada, we note that Canadian mills seem to be willing to ship under National rules, but as a general thing they want inspection at their mill to be final. This would be all right if we should buy sufficient to warrant sending our man up there while the lumber is being loaded, and it would be perfectly convenient if Canada had a sufficient number of licensed inspectors up there to give service at a reasonable cost, but in a case of buying one or two or even three cars from a Canadian shipper we find, as a general rule, that the cost of obtaining a satisfactory inspection at the mill is too great. We ship our lumber subject to the National rules at destination, or if we have a very technical customer we sometimes think it saves trouble to put a National inspector on here before shipping. But when a Canadian shipper demands National inspection at shipping point to be final it does not mean anything at all unless a National inspection can be made at shipping point at a reasonable cost. This fact has caused us to go to West Virginia for items of birch which we could really buy to better advantage in Canada, except that in order to get an inspection that we ourselves could guarantee we would have to go to large expense and trouble.

The points we are making are in no way whatsoever a "howl" on our part, and we are not in any way whatsoever putting ourselves up as a "More holy than thou" firm. As stated to you in our previous letter we are shipping a great deal of stock into Canada but as a matter of fact we sell very little to the consuming trade direct. We have made these points simply in reply to your request for an outline of our experience with the Canadian trade.

To sum the whole matter up, we would say that the average Canadian shipper should either get his nerve up to back his grade or arrange some workable plan whereby a wholesaler who purchases from him can get a grade at a reasonable price that he himself can back up.

This is a big problem and brings up the point as to whether the established grading rules are properly fitted to all kinds of business. Very possibly some consumers prefer a special grade and can get better value out of a special grade, but I think it is safe to say that whenever an established grade will answer the purpose it should be insisted upon, for such a standard is the easiest and most accurate way of getting at the actual money value.—U. S. Wholesaler.

### Canadian Stocks Popular—Grades Troublesome

Editor Canada Lumberman: Philadelphia, Pa.

For several years we have been doing considerable business, both importing to and exporting lumber from Canada. It is a difficult matter to write anything of an interesting nature regarding the business of the past year. In the first place, our business with our friends in Canada on material from the United States has been cut down considerably since the war. On the other hand, our exporting business from Canada has been cut down considerably during the whole year, even anti-dating the war.

**Our requirements for export usually are red cedar from the Vancouver district, white pine and Canadian hardwoods, such as maple and birch from the province of Ontario.**

**The Vancouver shingles are considered superior in quality and manufacture and when there is a demand for them there is not a great deal of difficulty to make sale at fair prices.** The agitation in this country by the producers of "substitutes for wood" in building, such as slate, tin and asbestos, has probably had something to do with the curtailment of the demand. The producers of these substitutes, wherever possible for them to do so, have endeavored to induce town and borough councils to prohibit the use of wooden shingles. Of course, every man or official whom they can frighten by the cry of "fire," not only helps their cause, but injures the cause of the shingle producer. Nevertheless, as an offset to their very progressive campaign, there are a great many people who still prefer to use a wooden shingle which has unquestionable merits that make it superior to the substitutes, and the Vancouver shingles stand very high in the minds of American people.

**As to white pine, the trade is necessarily limited because the Canadian mills grade their stock differently to the American mills and the purchases of Canadian white pine are largely made by those who are more or less familiar with the grades, from having purchased or seen them.**

**As to hardwoods, we have had excellent results and satisfaction in our shipments of Canadian hardwoods, particularly with your excellent product of birch.** Our firm has never done anything in the way of handling your spruce or hemlock.—Wistar, Underhill & Nixon.

Replying to some of your questions:—

White pine shipped into this country is sometimes used for boxing purposes. A considerable quantity of shop or cutting up lumber is shipped here that is used in the planing mills for manufacturing into sash, doors, etc.

The stock width boards are used for barns, partitions, ceiling, siding, flooring, roofing, etc.

As to the birch, we have had some birch from Canada that has been a particularly nice quality and pleased our customer. This birch is used for interior finish. A birch door and door frame, for instance, is a very beautiful piece of work. The stock is also used for manufacturing furniture, such as bedroom suites, cabinets, buffets, sideboards, ets. The birch that we get in this country is grown in West Virginia, Michigan, Wisconsin and in the Ad-

irondacks. Your Canadian birch comes into closest competition, of course, with the productions of the Adirondacks as well as those from Wisconsin and Michigan.

The northern birch, in our judgment, is much superior to the southern birch, that is, the production of West Virginia and the lower Adirondack Mountains. **The northern birch timber is larger and produces a greater percentage of red-wood, and is particularly effective where beauty of product is sought. The northern sap birch has a very fine close grain and is a very smooth grained lumber. When properly stained it produces a most excellent imitation of cherry or mahogany and considerable of it is manipulated so as to produce the cherry and mahogany effect.**

We do not think there is any doubt that one reason why more Canadian white pine is not sold in the United States, is the fact that the trade is educated to the grades as they are put up in Tonawanda, Buffalo, Saginaw and similar points, and a very large number of the dealers do not understand what is meant by "mill run common," " dead cull," "No. 2 cull," etc., as is put up by the Canadian mills. When a man operating a yard in a small town wants to buy a car of white pine, he generally places his order for something, of which he knows what the grade is before he gets it. He is educated to the terms used in Tonawanda, Saginaw and similar points. The stock offered under the Canadian terms at similar prices might be of the same value, but he would not know it because he cannot make comparison.—Wistar, Underhill & Nixon.

* * *

### Canada's Great Producing Capacity

Editor Canada Lumberman: Buffalo, N. Y.

The present problem is to find trade of any kind, either local or export. The possibilities of increase of export trade will be taken care of when it comes. As to the benefits which local markets would feel if export markets were enlarged, we can only say that this would necessarily have to be in a general way, as, without doubt, an increase of export trade will have a tendency to advance the price in the local market. "Production and consumption control." If the markets, either local or foreign, require lumber and wood products generally, they are going to be supplied. The difficulty is to curtail the production in such times as we are now passing through. Canada can furnish far more lumber and wood products than she does now, if called upon to produce the same.—New Ontario Colonization Company, Limited.

* * *

### Lower Freights Required from Georgian Bay

Editor Canada Lumberman: Bay City, Mich.

While we have never been direct exporters ourselves, we have sold for years past, from Thessalon, Ont., large quantities of 1 x 12 and high grade white pine lumber for the export market. As to the possibility of increasing export trade, not being familiar with foreign markets, we are not in a position to say, but, **as for increasing exports from Canada, we think this can be brought about to a large extent by the lowering of freight rates into the Eastern and Central Traffic Association territory in the United States, which would allow mills, especially in the Georgian Bay district, to compete with wholesale yards in the Tonawanda district.** The bulk of the lumber from the Georgian Bay district is going into the United States anyway, by water, but with lower freight rates this lumber could be shipped direct from the mills in car shipments.—Hope Lumber Company.

* * *

### Our Hardwood Products Needed in England

Editor Canada Lumberman: Owen Sound, Ont.

We have for years been doing some export trade with customers in Great Britain and France. Our shipments have evidently been found satisfactory, as we are always favored with repeat orders. The very excessive rates being asked at present will put a stop to lumber shipments, and under present conditions it is impossible to say what the trade will be in the future. **A large amount of maple, birch and elm products could be sold over there right now if freight rates were anywhere near normal.**—John Harrison & Sons Company, Limited.

* * *

### Export Trade Worth Going After

Editor Canada Lumberman:

Our opinion is that while the export business can be developed and is worth going after, still, it can be more satisfactorily handled by an exporter or wholesaler than by the mills direct, as in many cases one mill alone cannot supply the specification or grades asked for; whereas a dealer with more than one mill to draw from is in a better shape to handle this to advantage.

* * *

### Keewatin Mills Shipping Lath to Chicago

Editor Canada Lumberman: Keewatin, Ont.

Our shipments to the United States markets have never been very extensive, but we get an order for an occasional car of lumber to go to Chicago territory, and took a contract a year ago for a few hundred thousand feet 4-inch spruce strips milled in various ways, for shipment to points adjacent to New York City, but this business has been going lately to strictly spruce mills in northern Manitoba and Saskatchewan, where the stock can be bought at a lower price than we can name, even though our freight rate is more favorable. **Practically all our No. 2 lath is used in and around Chicago, and we find a ready market for our entire output at good prices.**—Keewatin Lumber Company, Limited, L. Nevison, Sales Manager.

* * *

### Manitoba Firm in the Chicago Market

Editor Canada Lumberman: The Pas, Man.

The condition of the lumber market in this company's natural territory, the prairie provinces, compelled us to look around for other markets for our lumber, and **we have succeeded in disposing of some of our output in the Chicago and Milwaukee territory.** We have also shipped stray cars to Michigan and further east, and we have booked a few orders for the Minneapolis and St. Paul market. However, the condition in the United States is not much better than it is in Canada. The consumption is not up to normal and the competition, especially in the Chicago market, with other woods, is very keen. We do not look for a revival of business until the war is over.—The Finger Lumber Company, Limited.

* * *

### Hoping to Increase Export Business

Editor Canada Lumberman: Port Arthur, Ont.

Our plant was originally intended to supply lumber locally and throughout the west. Only during the past two years have we done any export business to speak of, and that is not sufficient amount to be of any great interest to your readers. We hope to be able to do more of this class of business this year.—The Pigeon River Lumber Company.

* * *

### Selling Some Low Grades in the United States

Editor Canada Lumberman: Prince Albert, Sask.

The logical market for spruce lumber, manufactured in this district, is the prairie provinces, but **adverse conditions for the past few months have compelled us to market a certain amount of low grade material in the United States, but the price obtained for same has, however, not been very satisfactory.**—Prince Albert Lumber Company, A. L. Mattes, Manager.

* * *

### B. C. Mills Should Form Export Trading Company

Editor Canada Lumberman: Vancouver, B.C.

The lumber export business of British Columbia has, in the last ten years, gradually decreased from 36 per cent. to 3.7 per cent. **In my opinion this poor showing is due largely to the inefficiency of the sales departments of the British Columbia lumber manufacturing companies. There is no doubt, however, that the import duty on all mill supplies, which ranges from 35 per cent. to 42½ per cent., together with the ridiculous charge of 85 cents royalty, has done considerable to put the British Columbia lumber manufacturers entirely out of the running, insofar as competition on an equal basis with the Washington and Oregon manufacturers is concerned.**

Looking back over the facts, it is peculiar that both the Dominion and Provincial governments have financially, as well as otherwise, assisted the mining industry; have built large warehouses for fruit and produce shippers' associations; have built grain elevators to care for the farmers' grain; and have subsidized several different railroads on the pretentious claim that it is for the purpose of developing industries that will give aid and employment to the population of the country. But, every time the local government assists some other industry, in some way it seems to work around to deliver a direct death-blow to the lumber manufacturing industry, which is the largest in the province, or in fact in Canada, both as regards the money invested and the employment of labor.

It is also remarkable to note that the lumber manufacturers, or those connected with the lumber industry, have never made any attempt to abolish the ridiculous government royalty or the exorbitant import duty; but they continue to fight for the protective tariff in Canada, which market is so small that it would not give continuous cutting to one-fourth of the mill capacity on the Pacific Coast if all the business in Canada was diverted to them.

**It is my belief that what is most needed by the British Columbia lumber manufacturers is the organization of an export trading and transportation company, incorporated for about $5,000,000, with the stock subscribed for by the different lumber manufacturers in the Province of British Columbia pro rata, according to the cutting capacity of the different mills; the stock to be paid for by an assessment of 1c. or 2c. per M. ft. cut.** This company should also be able to obtain some government's financial assistance; or, in other words, the government should either build a number of ships, or subsidize the company for the purpose of building same. In the hands of a good and competent manager this organization should have no difficulty in establishing efficiency in the sales departments, and in overcoming a good many obstacles in the way of the lumber export business of this province at the present time.

During May and June, 1914, the writer suggested such an organization to several British Columbia lumber manufacturers, only to be advised that it was not practical, and that it was too big a proposition to undertake. Notwithstanding the magnitude of the scheme, or the fact that our lumber manufacturers consider it impracticable, Messrs. D. E. Skinner, Major Griggs and J. A. Bloedel, are at the present time incorporating such a company in Wash-

ington and Oregon and are seeking the services of good and competent salesmen to assist Mr. Gilbert in executing the plans of that company.

If the Washington manufacturers can do these things, it seems quite probable the British Columbia manufacturers could likewise organize, and send direct representation to the different foreign markets and fields for the purpose of cultivating the trade and ascertaining in what way business is done, and try to develop these markets along the lines that will bring a substantial growth of the export business, instead of allowing it to decrease.—Harry G. Hayes.

* * *

### English Box and Case Trade Important

Editor Canada Lumberman: Duncan, B.C.

As an exemplification of the possibilities of increasing our export trade in lumber, we call attention particularly to the fact that but **recently we received an enquiry from an English firm whose requirements for box making and packing case material amount to six million feet annually.**

Precisely how we can increase our export trade in lumber is the one master problem of the industry today, and it would seem almost too obvious to mention that having something to sell, we must know, definitely and clearly, just what to do to achieve or attain our desires in this direction.

Our ability, therefore, to work up an increasing export business will depend upon organizing the various elements of a real purpose for effective action.

Generally in these matters there is always a temptation to "let the other fellow do it," but it cannot be too strongly advanced that co-operation is essential for the accomplishing of our objects.

True, our government has done the efficient thing in taking steps to further the interests of the industry abroad, but we must complement this by formulating and determining upon effective action on our own account.

Against competition, the sales appeal of which ends with formal quotations, we must have intelligent presentation of the points of merit of our product, plus actual sales assistance, which makes it clear that we should have a resident agent or agents in the market or markets selected, whose function it would be to find out the requirements of those markets, analyze the knowledge thus gained, and apply it to our problems accordingly.

If we study markets carefully, use business judgment in the selection of agents, and work out a well-balanced selling campaign which takes the essential factors into consideration, results are certain.

A little study will approximate the cost in this direction once the form of campaign has been settled, and we have begun to outline its details.

Don't let it be said, "We can't afford the expense." If we really want to increase our export trade in lumber—desire it intensely enough to pay the price to get it—we can get it with action in conformity with our desires. Progress in this direction absolutely depends upon initiative.

It is conceded that in procuring transportation facilities we are at a disadvantage with our competitors, but perhaps with the effluxion of time these conditions will be adjusted, or at all events mitigated to an appreciable extent.

It is important that we hammer down deeply into our minds what an increasing export trade means to the industry. It offers the key to all the locks which have shut out expansion in the past and which bar the way to expansion in the future.

It must not be forgotten that during the past few years conditions have been changing and instead of developing initiative to meet them we have become set in routine.

It is not enough for us to be efficient in manufacturing, but we must also sell what we produce. The same holds true for the farmer, the miner, the fisherman, the merchant and others. The lawyer, the doctor, the editor, and others with mental products are not exempt from the same law. In other words, everyone has something to sell and to a greater or less extent the success of everyone depends upon salesmanship.

Let us picture to ourselves what it would mean if all the British Columbia export mills located on tidewater were fully engaged in cutting on foreign business. The effect on our home markets would be tremendous.—Island Lumber Company, Limited.

* * *

### Export Trade Will Grow by Leaps and Bounds

Editor Canada Lumberman: Vancouver, B.C.

Generally speaking, there is a better demand for lumber than there was six months ago and as a proof of this, the railroad shipments show an increase of over 40 per cent. The local business is very slack, but the north-west trade is gradually increasing and this refers principally to fir lumber. For cedar lumber United States trade, there is a much better demand and the trade has been increasing in both shingles and lumber. The best quality of No. 1 cedar logs have sold as high as $13 to $14 per m.

The export business is somewhat better. The lumbermen in this province have been encouraged recently by the action of the B. C. Government, and also by the action of the Dominion Government, which governments respectively are using their best efforts to assist and help out at this time. **The B. C. Mills Timber & Trading Company, of this city have just received an order for 10 million feet of lumber from the Imperial Government for prompt shipment. I have been informed by several mill owners recently that they have sufficient export orders to keep them going, provided they can secure bottoms in which to ship the lumber, but boats are scarce and rates are high.**

**Such a large portion of our timber in British Columbia is situated on, and tributary to, salt water that our export trade in the near future will increase by leaps and bounds, as we are better prepared to take care of the business than the interior lumberman.**

We are all watching with interest the crop conditions in the north-west, as a big crop at prevailing prices would be of material assistance to the lumber business at this time.—C. S. Battle.

* * *

### Persistent Personal Representation Required

Editor Canada Lumberman: Victoria, B.C.

The export lumber business of British Columbia, from our point of view, rests entirely with the lumbermen themselves, and is simply a matter of development. At the present time there are just four or five mills which have the loading capacity to handle export shipments, and wharves on deep water to accommodate ships. When we enter the field for export orders we are placing ourselves in competition with concerns which have been established for a number of years, long enough in fact to have built mills expressly for the purpose of catering to foreign business, and, we cannot expect to divert trade this way until we have placed ourselves in a position to turn out lumber as economically, and load ships as conveniently as can be done by our competitors.

It is only just lately that British Columbia has had such a mill, and since entering the field it has been working continually cutting and shipping to foreign parts in spite of adverse conditions.

These inconveniences, of course, have their reaction on our prices, and at the present time especially, when lumber is being sold at such close prices, such things are very often the deciding factor which tips the scales against us. Another item to be taken into consideration is the fact that we are not possessed of as large an internal market for our upper grades as the American coast mills, which can sell the ordinary run of common lumber cheaper, for the reason that they have a market which is more ready to absorb the upper grades at prices which are always a few dollars stronger than ours, and will take far greater quantities than can be handled here. In fewer words, the logs can be cut to the best advantage, and the entire product sold, whereas, the mills in this province are often compelled to include stock which contains a better grade than the inspection calls for, to fill an order; not having sufficient demand for upper grades, at prices high enough to pay for sorting out.

**Personal representations with offers of some particular advantages in the way of prices or terms will probably obtain best results in the foreign market.** A buyer who has been in the habit of securing his lumber from a satisfactory source for a number of years, is not going to make a change unless real pressure is brought to bear. In export this is particularly so, as much has to be taken for granted as to whether the selling party is capable of fulfilling his contract. The amounts of money involved are large, and the buyer has a comparatively small chance of looking into the standing of the seller.

We have the timber here in this province, but we need capital, for development along the above lines. With these two factors there is no reason why we should not participate in the supply of lumber to any port in the world.

It is our firm conviction that this will be brought about, but, it will be the outcome of close application and a considerable amount of missionary work on the part of the mills of this province, together with the judicious use of capital here, and the establishment of connections in the large markets, particularly Australia, China and South Africa, for which we are the natural source of supply.—Leicester & Crocker Timber Company.

### Trade Starving for Want of Ships

Editor Canada Lumberman: Victoria, B. C.

British Columbia mills on and contiguous to tide water are capable of producing for export approximately one thousand million feet per annum.

Markets for that quantity of lumber are to be found on the shores of the Pacific Ocean. Some missionary work and shipping facilities are needed to secure and hold the markets.

Of course, some business will always be done with the United Kingdom, and as the years go by it will naturally grow in volume. With the markets mentioned fully developed, and the export mills busy taking care thereof, the direct money benefits to the province would reach a sum of fifteen million dollars per annum. At the same time, the mills in the interior and along the railway lines would have a practical monopoly on the domestic business of the Dominion, and would all be busy. The products of these mills and the overs of the export mills which would be sold to the domestic markets would be worth another fifteen million dollars. If such conditions could be brought about hard times would be banished from British Columbia. There would be work for every physically able man at a good wage and every other useful industry would soon be in a prosperous condition.

**The most pressing need confronting the lumber industry at this time is tonnage for carrying our products to over-seas markets.** Many orders are today in the hands of our lumber manufacturers being held until shipping facilities can be definitely fixed. In other words, the whole industry is languishing and starving for want of ships.

If it were possible to go ahead and develop the off-shore business the domestic demand would very soon use all the log run products not applicable to those orders, and the burden of carrying large stocks of these by-products

now being borne by the mills doing export business would be greatly mitigated.

The Department of Trade and Commerce of the Dominion has already entered on an active campaign of missionary work to obtain an entrance into the most accessible markets for our products, and I understand that the formation of a syndicate for the chartering or acquiring otherwise of a line of ships is being agitated by a group of substantial business men in British Columbia; the idea being to give the British Columbia industries the first call on the ships, and in turn have the industries give the ships the first chance to carry their products. If such a plan could be carried through it would be a great boon to the lumber industry of this Coast.—J. O. Cameron.

### Coast Mills Should Solicit Export Trade

Editor Canada Lumberman: Enderby, B.C.

Located as we are, three hundred and fifty miles from tide water, the exportation of any of our products is prohibited by local freight charges to the seaboard. We have a species of white pine, however, some of which we have succeeded in selling to a foreign market. The supply of this is limited and the question of seeking a market for this particular stock is of very little moment.

**The Pacific Coast mills are very well equipped to solicit business for foreign shipments and should use every effort possible to make a market for their products.**

The consuming trade of the three prairie provinces, namely, Alberta, Saskatchewan and Manitoba, furnish about the only markets in which the British Columbia mountain manufacturers can find sale for their stock. Development in these provinces has been slow, for the unlimited areas of agricultural lands and the consumption of lumber has been very small thus far.

The cities of the three provinces named are developed to a wonderful degree, and in our opinion it will be some time before there is any volume of lumber required for building in the cities, therefore we will have to depend on the agricultural and small town trade for our market.

In the event of the coast manufacturers securing a profitable market for their products, it would naturally relieve the competition the mountain mills have to contend with in the interior lumber consuming territory, which would benefit all those manufacturers who are not favored with water shipping facilities.—Okanagan Saw Mills, Limited.

### Shipping Difficulties Should be Removed Now

Editor Canada Lumberman: Vancouver, B.C.

We find very little to report regarding the export trade to the West Coast of South America from British Columbia, the lumber shipped having dwindled in volume from nearly five million feet in 1913 to less than one million in 1914. Chilian exchange is now about seven pence on the dollar and business almost prostrate; owing, mainly, to the cessation of export from that country of the nitrate output which went chiefly to Germany, Bilgium and Holland.

It is rather humiliating to find, however, that while the export from British Columbia dropped nearly 80 per cent., that from Washington fell only about 40 per cent., and from Oregon nearly 18 per cent.; and both of these on a very much larger annual output. It is the old story; something more than general conditions is the matter with our lumber industry. We ought really to be in somewhat better position for chartering tonnage for export since we are not restricted to American bottoms when shipping to United States ports, as the shippers south of the line are, and yet the advantage seems to lie with them. **The actual expenses of making Washington or Oregon ports and those in British Columbia are reported about the same, yet owners appear generally to prefer a United States charter. This is detail that should be docketed for investigation while trade is quiet, that we may not have it to do when things assume their normal condition once more; for the Chilian and Peruvian trade is worth going after,** though, from the nature of it, it is not strongly in favor with the shipper. The material called for is of a medium grade (merchantable), but the schedule of sizes is always kept carefully down to the base price; that is, the sizes are demanded that come into the lowest scale of prices only. Cargoes taking in ordinary run of sizes as the lumber comes from the mill are, of course, more easily filled.—Mainland Lumber & Shingle Co.

### How A B. C. Ship Broker Sees the Situation

Editor Canada Lumberman: Vancouver, B. C.

British Columbia's chief industry is lumber. Had we the carrying capacity to send our lumber away, that our friends to the South have, we would be in a better position than we are now. However, I am very glad to be able to say that this seems to be attracting the attention of our lumbermen. Possibly it is because they find our prairie markets are not requiring the quantities they have for the last few years, and which detracted from our oversea shipments.

**To my mind there is but one cure, one way in which this matter can be satisfactorily handled, and that is to own our own vessels.** It seems a very bad time to say this, because money is scarce, but I hope it is not always to continue so, for the war surely will not last forever, but when shipbuilding is established and energetically followed in our own country here, we will have commenced at any rate to get what we should have had years ago, i.e., the carriers of the cargo we can provide. Our neighbors to the south have done it for years and years, and traded with our own people, instead of our trading with them—I mean the Australians.

As a particular instance I might mention to you that for your city (Toronto) one of the largest steamers owned on the Pacific Coast, the S.S. "Bessie Dollar," of the Dollar Line, San Francisco, has just left here, carrying her second cargo of lumber for use in Toronto. It is discharged at an American Atlantic port and railed from there to your city. This steamer alone, carries some three million feet of lumber, and this will be her second load of a like quantity from here to your city, I believe for your harbor works. —C. Gardner Johnson.

### Should Encourage Reciprocal Trade

Editor Canada Lumberman: New Westminster, B.C.

We are pleased to learn that you intend to issue an "Export" number. British Columbia Douglas fir, white spruce and red cedar lumber are in demand in all countries where they are known, and it is only a question of cost of transportation as to how much business British Columbia lumber manufacturers can do with foreign countries.

**A fleet of freighters owned in British Columbia is probably our greatest need just now. Also the establishment of more manufactories to use raw material from the countries to which our lumber goes.**

There is great scope here at the Coast for tanneries, and we have the hemlock bark. Also for rope walks, binder twine factories, the manufacture of jute and sacking, soap works, ore refineries and steel works. This is also the logical distributing point for tropical fruits and goods manufactured in the Orient, and for tea and coffee. The sugar refining business is fairly well established already and attracts a small fleet of freighters to the Coast.

Just at present the high cost of transportation shuts us out of profitable business with the United Kingdom and with foreign countries, but, if shipping could come here profitably with loads, that would go far to solve our difficulties.—Brunette Saw Mill Company, Limited.

* * *

### B. C. Exporters Not Keen After Business

Editor Canada Lumberman: Vancouver, B.C.

In this letter we refer only to the conditions of the export business in British Columbia, from a wholesale exporter's point of view. When placing our orders we find the manufacturers in the State of Washington very keen to get the business so long as the price is reasonable, while the majority of British Columbia manufacturers are very apathetic when export orders are mentioned. **If British Columbia wants a large export lumber trade our manufacturers must look alive to secure every piece of business they can, so long as there is any profit in it, and get the buyers in various parts of the world, who are using the woods we produce, to get the habit of looking to British Columbia for their supplies, instead of to Washington and Oregon,** whose manufacturers long ago cultivated this line of business and catered to it when the home market was good, and when it was poor.

A comparative statement from the Pacific Lumber Inspection Bureau, Seattle, Wash., which shows the extent of the water-borne lumber business from the North Pacific, shows that British Columbia's share is only about 2½ per cent. of the total, and about 6½ per cent. of that classed as foreign. If British Columbia wants her share of this water-borne business her manufacturers must try harder to secure business when it is put in front of them. There is no use sending government officials out to work up business until more of our manufacturers show a disposition to take advantage of what is already available.—Timms, Phillips & Company, Limited.

### British Columbia Poles and Piles

Editor Canada Lumberman:— Vancouver, B.C.

One million poles seems a large quantity. And it is a great number when one stops to consider that the ordinary pole vessel carries about three thousand poles and it would take 333 such vessels to carry one million poles. Yet when an order for this quantity was rumoured a few years ago no one familiar with the pole situation in British Columbia was overwhelmed by the quantity suggested, for British Columbia is a pole maker's paradise. Not only is the timber suitable and abundant, but in no country in the world is it more accessible to sea-going vessels.

The trees in British Columbia grow to great length, not exceeded, in fact, by any, except the giant Sequoia of California. And the British Columbia trees, though strong and tough, are very slender, making it possible to get a great number in a vessel. This, of course, reduces the cost of transportation and makes it possible to lay down poles and piles at a great distance from British Columbia at a lower cost than poles of a more rapidly tapering growth. Again, the timber is abundant, and this makes the cost of logging low, as only a few logging roads are required to get out a great quantity of timber.

It is however, in the accessibility of the timber that the great superiority of British Columbia is most strikingly shown. The coast of the mainland, as well as Vancouver Island, is deeply indented with innumerable bays and inlets, which are not only well sheltered, but are deep enough to allow the largest ocean-going vessels to lie at anchor and safely load the floating poles.

In most other parts of the world the timber close to the water's edge has already been cut; in British Columbia, particularly in the northern portion, the forests are untouched, and British Columbia could easily supply the requirements of the world for years to come.

While the demand at the present time is for poles of thirty-five to forty feet in length, with eight-inch tops, it is not difficult to get cedar poles up to one hundred feet in length.

A few years ago, when a peculiarly designed bridge in the Mississippi River required piles one hundred and twenty feet in length, it was found that they could only be obtained on the West Coast. There is a growing business in the export of piles of these large dimensions to such widely separated points as New York and China. Piling of shorter lengths can be obtained at points much closer to either New York or China than British Columbia, but for the long piles the purchaser must come to the West Coast.

At the present time the pole business in British Columbia is in its infancy. For the last few years vessels employed to handle poles exclusively have been constantly plying from British Columbia to California ports, but they have so far only called attention to the great resources in pole timber of British Columbia. The dealers in poles are patiently waiting until orders for one million poles will become actual facts instead of unauthenticated rumours.—Paul Day, Treasurer Federal Lumber Company.

### Mountain Mills Working Up Export Business

Editor Canada Lumberman: Canford, B.C.

We had never considered that our location would enable us to get into the export trade, but during the past two weeks our Vancouver representative has been bringing to our attention the possibility of exporting our pine to England. He has recently negotiated some parcel shipments of 100 to 200 M. feet to England for other parties, and the results have been highly satisfactory. We have just forwarded to England some samples of our stock and if these samples are favorably received it is our intention to make shipments from Vancouver by way of the Canal.

We anticipate many details would have to be perfected covering this business, but nothing of an insurmountable nature.

**In addition to the possibilities of working up a favorable export trade, we are working up a very nice trade in the far eastern and middle western States.** The fact that we can get into this market and make a better showing than when shipping to the Canadian northwest, means that if other pine operators in British Columbia do the same thing, the prairie northwest market will be materially relieved, which should give some benefits to those concerns that manufacture only fir and cedar, which does not find a ready market in the same territory with the pine.

We are not basing any plans on what may develop for off-shore business, but we are interested in keeping advised of the trend of events and doing everything in our power to extend the markets for British Columbia forest products.—The Nicola Valley Pine Lumber Company.

* * *

### Present Situation Only Temporary

Editor Canada Lumberman: Fraser Mills, B.C.

I am fully alive to the necessity for further developing our export lumber trade, and I think the work being done by the Forest Department of the British Columbia Government, as well as the Dominion Government, will be of great benefit to the lumber manufacturers, as well as to the Province of British Columbia.

In speaking of the export lumber trade in British Columbia, I am somewhat surprised at the statements being made by different parties as to the cause of our present situation. Many overlook the fact that all lines of trade are dull, and most particularly constructional materials. This is a world-wide situation, and while it is true that more business could be done if ships were available, at the same time there is not a sufficient volume of business in sight to warrant any marked degree of optimism.

I am very glad to see that our Governments are at last alive to the necessity for doing something to foster such an important industry as the lumber business, and I believe that the campaign outlined by the Government is along the right lines. Hitherto every government exhibit which I have seen has consisted of a section of a very large log, or a very wide plank, or a very large square timber, none of which is particularly interesting to a builder except that it interests him as a curiosity.

**The present export situation, which is most unsatisfactory, is, I am quite sure, only a temporary condition, which, with the ending of the war, will be very materially improved.**—Canadian Western Lumber Company.

* * *

### Opportunities Which May Never Recur

**The present trade position resulting from the conflict centering in Europe and involving directly or indirectly the entire world, gives Canada opportunities of securing business openings which if neglected may not recur. These are principally of an export character, and possibly apply in a special manner to the export of wood goods and wood products.** The Russian export trade in hewn and sawn timber to the United Kingdom represented in bulk very nearly one-half, say 48 per cent. of the entire import in such wood into that country. This has been largely cut off, Archangel alone of Russian ports remaining available for export purposes. Swedish wood goods have been declared contraband of war by Germany, and as that country practically controls the Baltic, the prohibition is effective. The paper manufacturers of Great Britain must for the present look beyond their old and long established sources of supply for their raw material, whether pulp wood or wood pulp, or their customers, the consumers, must buy the paper they require elsewhere.

**Now is the time for the Canadian producer and manufacturer to supply the deficiencies and secure the markets, for trade once diverted is slow to return to its old channels.** It is impossible to say how long this war will continue, but it is causing disorganization in many wood-producing countries from which they will be slow to recover, and it will be succeeded by a period of reorganization during which supply will be limited, with the demand for material for reconstruction great. That material will certainly be, in the first place, wood sawn to scantlings, deals, planks and boards. The coal mines of Great Britain, even now, require pit props most urgently, of which they consume annually an enormous quantity. The railways require sleepers or ties, and must have them. As the war continues, the demand under urgent necessity, for both these articles will increase, and must be met from some quarter. Box making and packing case material will certainly be wanted very largely, as will common building material. **It is strange indeed if Canada cannot secure a large portion of the trade which war conditions give the opening for, but it will not be secured unless producers and possible producers, exporters and agents, make every possible effort to take advantage of the opportunity.** It is necessary to ascertain exactly what is required, and then meet the demand with accuracy, giving the purchaser precisely what he specifies, for the British importer would rather pay a high price for what he thinks he wants than a low one for something that the other party may consider just as good.

You would confer a benefit on the trade by inviting information and suggestions, and opening your columns to correspondence on the subject.

The question of increased rail rates is just now an open and pressing one. It would be very unfortunate if an increase on export traffic charges on wood in any manufactured form were made at the present time. Such rates should not be advanced at present unless they are found in any instance to be so absolutely unremunerative that the railways would be better without the traffic. Certainly railways are entitled to charge and must obtain profitable rates, but with a little patience they would get them with increased traffic, and probably present export rates on manufactured wood are amply remunerative. —Edward Harper Wade, Quebec, P.Q.

## Ontario Timber Sold By Tender

The recent sale by tender of timber limits southwest of Windermere Station, Ont., conducted by the Department of Lands and Forests for Ontario resulted as follows:—

Township 25, range 23, sold to Austin & Nicholson, Chapleau, Ont.: red and white pine, $7.60 per M. ft. B.M.; Jackpine and spruce, $4.35 per M. ft. B.M.; hewn ties, 11c. each; pulpwood, 90c. per cord; all inclusive of Crown dues; cheque for $1,500.

Township 24, range 22, sold to Austin & Nicholson: red and white pine, $6.00 per M. ft. B.M.; Jackpine and spruce, $3.50 per M. ft. B.M.; ties, 6c. per tie; pulpwood, 55c. per cord; all inclusive of Crown dues; cheque for $250.

Township 24, range 23, sold to Austin & Nicholson: red and white pine, $6.00 per M. ft. B.M.; Jackpine and spruce, $3.50 per M. ft. B.M.; ties, 5½c. each; pulpwood, 45c. per cord; all inclusive of Crown dues; cheque for $1,000.

Township 26, raige 22, sold to Austin & Nicholson: red and white pine, $5.50 per M. ft. B.M.; Jackpine and spruce, $3.25 per M. ft. B.M.; ties, 5½c. each; pulpwood, 45c. per cord; allinclusive of Crown dues; cheque for $750.

Township 24, range 21, sold to Austin & Nicholson: red and white pine, $5.00 per M. ft. B.M.; Jackpine and spruce, $3.50 per M. ft. B.M.; ties, 6c. each.; pulpwood, 50c. per cord; all inclusive of Crown dues; cheque for $500.

Township 25, range 22, sold to A. B. Gordon: ties, 10c. each; pulpwood, 65c. per cord; pine and other timber, $3.15 per M. ft. B.M.

## A Use for B. C. Cottonwood and Alder

The possibility of developing important export markets for cottonwooad and alder, which grow in large quantities in British Columbia, particularly in the Fraser River district, is attracting considerable attention. Mr. J. R. Davison, Industrial Commissioner for Vancouver, states that he has received a number of enquiries upon this matter of late. The chief difficualty in connection with cottonwood in the past has been its brittle nature which made it a poor material for boxes. It is believed that this drawback can be entirely overcome by putting the wood up in the form of 3-ply veneer. Experiments along this line have been most encouraging. A box manufacturing company at Sapperton, B.C., is now installing a plant for handling this class of material. The company has canvassed the markets in Oregon and Washington and reports that there is an excellent outlook for doing busines in these States. It expects that it will also be possible to open up trade with the Middle States and perhaps also with Australia and Japan.

Fine Shipping Facilities of a Large Miramichi Plant.

# European Markets and Trade Customs

## Facts Figures and Details of Business Methods Essential to all in the Transatlantic Export Lumber Business

Written specialty for The Canada Lumberman by A. E. Trotman*

By the Editor's assignment I am to give a short digest of the European markets, and as much useful information in connection therewith as is possible within the limits of a newspaper article. It is about like attempting to tabloid a century down to ten minutes of movie film.

The European softwood productions consist of Baltic, or Swedish, red (Pinus sylvestris, also called red and yellow deal, Memel, or Danzig timber, Kilfer and Scotch fir or pine), and Baltic white (Picea excelsa, or Norway spruce). The American Continent is featured by white pine (Pinus strobus, often termed in Europe yellow pine), Longleaf pine (Pinus palustris, mostly called pitch pine) and Canadian Spruce, and Pine—P. pinaster (cluster pine) and Maritima—Larch, Oak, and Beech. Several other woods are exploited, but the bulk of the trade is in those named.

The total forest area of Europe is about 700,000,000 acres, of which Russia has 500,000,000. Sweden and Austro-Hungary 40,000,000 each, Germany 30,000,000, France and Spain 20,000,000 each, Norway, 16,000,000, balance other countries, including Great Britain's 2,500,000. The stands are not as dense as on the American continent, and the trees are smaller; comparatively little beyond 3 x 11 is cut, and not very much of that. From this fact grew the large trade the St. Lawrence had for years in regulars and broads, the decline of which is letting in shipments of Kedr from Vladivostock (Siberia) in such dimensions as 3 x 12/24, which command excellent prices, and rather resembles white pine.

The European saw mill policy is to get the greatest cubical contents from the log irrespective of dimensions, or other factors, and elimination of waste is brought down to the finest point; some mills make from deals down to brush backs (4 in. x 2 in. x ½ in.) and use the waste for charcoal, or distillate manufacture.

Close attention is given to seasoning. Kiln drying is not favored. Redwood is sawn in the winter, before cutting the white, so as to secure as long as possible to condition; four months is reckoned as time needed. White seasons more quickly, and if discoloration takes place the loss in value is less than on red. Taking goods valued at about $20 per M. f.o.b., discolored red are worth about $2 less, white $1.25, than bright goods. Condition is a very important factor in avoiding claims, and regular sawing is next in importance. A shipment well seasoned, showily bright, and well manufactured, will often get by even if goods are really a little below grade. Most of the best European makes will run almost dead true to width and thickness, even in common narrow battens. If cut shy further conversion to boards, etc., is prejudiced. If cut full the customs duty is likely to be higher with no advantage to users. In some cases cutting to metric feet is required which foot is 13.1 inches. Owing to irregular sawing the writer has seen cargoes of Lower Gulf Spruce turn out 5 per cent. less than invoice. Baltic goods are usually a little shy, less than 1 per cent.; White Sea goods exact, or a little in excess, and British Columbia goods vary one way or the other. This is detrimental to both the Spruce and B. C. trade.

Importing transactions are based on the P. S. H. (Petrograd Standard hundred of 165 cubic feet equals 1,980 feet B. M.) as regards D. B. B. and S. B. (Deals, Battens, Boards, and slating battens) and on the load of 50 cubic feet (600 feet B. M.) for sawn, and hewn timbers. To convert Feet B. M. to P. S. H. divide by 2,000 and add 1 per cent. of the answer. To convert P. S. H. to Feet B. B. multiply by 2,000 and deduct 1 per cent. of the answer. The first formula is shy one part in ten thousand; the second is mathematically correct. Some French business is done on the basis of (say 35) centimes per lineal foot of 3 x 9 (a franc equals 100 centimes par value 19.3 cents). Pit supplies are handled in importing transactions at "per Fathom of 216 cubic feet." Prepared (planed) boards are invoiced on "nominal" measure, i.e., measure before planing.

Import duties are not referred to, as no seller should undertake responsibility for same. The tariffs have many deadfalls, and buyers are the proper people to deal with same.

Sea freights are based on the P. S. H. for sawn and planed goods (latter being paid for on the "actual" measure, i.e., contents after preparation); pit supplies are rated per Fathom, and sawn timber per load.

The sale contract calls for quantity of each dimension, and quality, often guarantees the average length of same, varying with each item (a 16 ft. average is worth perhaps $1.25 more than a 14 foot stock in framing battens) and reads "goods to be properly seasoned for shipment to ————, and shall be shipper's usual bracking (grading) average length and fair specification for such description of goods." The contract allows a margin of 10 per cent. more or less for convenience in chartering, but not exceeding 100,000 ft. B. M. in all.

Bills of lading are issued according to buyer's requirements, usually averaging about 100,000 ft. to each. In many cases goods are sold for delivery "overside," i.e., direct from ship to scow, and such parcels must be a fair allotment of lengths to each, must be kept separate in stowing aboard ship, and delivered intact at discharge.

Strike and arbitration clauses are of the usual character. Claims are to be notified within 14 days of ship's final discharge—and detailed within 21 days, and items complained of to be left intact until after inspection. Lines not involved in claims may be dealt with by buyer so long as they comprise any single item on the shipment. If claim is made on, say, a bill of lading for 50 P. S. H. of 2 x 4, and there are five other bills of lading for 2 x 4 same price shipped, then all must be held intact so as to allow inspection of the item as a whole.

### The Basis of Prices

Prices are based on the value of 3 x 9 third and a buyer given this price knows the corresponding price of other grades and sizes. Take $26.50 as price of above, then 3 x 9 seconds are generally worth $8.50 more, 3 x 11 third $1.25 more than the base price shown. Rough boards (1 to 2 inch) are worth $3 more than the same grade and breadth in deals and battens.

Grading is not standardized, but each shipper marks his goods (Baltic usually is stencilled; White Sea hammer mark) having separate brands for each grade, and with different marks for sawn and planed goods. These marks are very valuable items; they have come to represent a constant as regards grading to which buyers have educated themselves. Goods pass from hand to hand on marks only, very often. Some marks command $1.25 to $2.50 more than other brands ostensibly of same size and grade. This difference represents the higher value the trade places on favorite stocks from careful shippers. The usual grades are:—

Baltic red 1st, 2nd, 3rd, 4th, 5th, going in many cases further to inferior 5th, Wrack, 6th, inferior 6th, and Torra.

Baltic white 1st, 2nd, 3rd, 4th, 5th, White Sea goods 1st, 2nd, 3rd, 4th and 5th, Siberian Kedr 1st, 2nd and 3rd in sawn goods. The European mills also ship huge quantities of u/s (unsorted) which answer to the middle grades in one. The bulk of the Spruce from the St. Lawrence is probably shipped u/s. Colonial (Australia and South Africa) grading is French first or mixed (mostly confined to prepared boards) analagous to the No. 2 clear and better" of this continent, 3rd, and 4th, and 5th.

### Payment Arrangements

Payment is usually four months (Baltic) from date of bill of lading, 90 days or 120 days sight (White Sea and Canada) approved acceptances to seller's drafts payable in London, or other centre. Cash at buyer's option less 2½ per cent. discount.

Prices for 1913 ruled about as follows:—

Baltic Red F. O. B. per M. Ft. B. M.

| | 1st | 2nd | 3rd | 4th | 5th |
|---|---|---|---|---|---|
| Swedish 3 x 9 in. ... ... ... | $39.00 | $35.00 | $26.50 | $24.00 | $21.00 |
| Swedish 2½ & 3 x 7 to 8 in. | 29.50 | 24.50 | 21.75 | 19.75 | 17.00 |
| 6 inch | 28.25 | 23.25 | 20.25 | 18.50 | 15.50 |
| 2 x 4 unsorted ... ... ... ... ... ... ... ... ... ... ... ... | | | | | $19.25 |

Swedish freights vary from $3 to $6 per M.

Insurance from one-third of one per cent. up to 2 per cent., according to sailing date.

| | 1st | 2nd | 3rd | |
|---|---|---|---|---|
| Petrograd 3 x 11 in. ... .... | $39.50 | $30.00 | $24.00 | |
| (Russian Baltic) 9 in. ... ... | 31.25 | 26.50 | 24.00 | |
| 2½ and 3 by 7 and 8 in. ... ... | 26.50 | 22.25 | 19.75 | |
| do White Deals, 3 x 9 ... ... | 25.00 | 23.50 | 21.50 | |
| Riga u/s White, 7 and 8 in. (packing case goods) ... ... .. | | | | $18.00 |
| Finnish u/s Red 2 x 4 to 6 in. ... ... ... ... ... ... ... ... | | | | 19.25 |
| Petrograd and Finnish u/s white 2½ and 3 x 7 and 8 in. ... | | | | 20.50 |
| Petrograd and Finnish u/s white 2½ and 3 x 6 in. ... ... ... | | | | 19.75 |

Freights and insurance about the same as Swedish.

| | 1st | 2nd | 3rd | 4th |
|---|---|---|---|---|
| White Sea 3 x 9 in. ... ... ... | $37.00 | $32.00 | $24.50 | $22.00 |
| 7 and 8 in. ... ... | 27.00 | 22.50 | 18.50 | 17.50 |

Freight ranges from $4.50 to $10.50.

Insurance from ½ of one per cent. up to 3½ per cent.

*Late of London, Eng.; Grimsby, Eng.; Carrick on Sair, Ireland; Durban, South Africa, to

| | 1st | 2nd | 3rd | 4th |
|---|---|---|---|---|
| Yellow Pine 3 x 11 in. ... ... ... | $95.00 | $65.00 | $42.50 | $30.00 |
| (Canadian White Pine) 3 x 7 to 10 in. | 73.00 | 52.50 | 32.50 | 27.50 |

Freight and insurance slightly higher than White Sea rates.

The freight and insurance rates shown are for steam tonnage. Insurance of sailing ship cargoes is, of course, much higher, ranging from the equivalent of fifteen cents per M. (on $20 per M. value) up to $1 per M. in the Baltic and White Sea risks, and even higher from Eastern Canada.

The total yearly volume of hewn and sawn softwoods European trade exceeds 8,000,000,000 ft. B. M., and the following is a close computation of the sources of supply:—

| | | | |
|---|---|---|---|
| Russia ... ... ... | 2,000,000,000 | Canada ... ... .. | 500,000,000 |
| Sweden ... ... .. | 1,950,000,000 | Norway ... ... .. | 307,000,000 |
| Finland ... ... .. | 1,700,000,000 | Germany ... ... .. | 250,000,000 |
| United States ... | 1,200,000,000 | Austro-Hungary . | 250,000,000 |

Of the European productions approximately three-fifths will be red, two-fifths white wood. The planed (dressed) goods total about 450,000,000 ft., practically all Swedish and Norwegian manufacture. Austro-Hungary has a large rail trade with interior and southern Germany, Italy, and the Eastern European States, and this territory only holds out prospects of a limited market for timbers (say 6 x 6 in. and up). At the same time some trade in other goods might be got as the (so called) Austrian whitewood is brittle, and prone to twist, warp, and shake.

### Great Britain the Largest Buyer

Great Britain is the largest buyer and in 1913 her imports of softwoods totalled 3,981,682,000 ft. B.M. sawn and planed, of which about 190,000,000 ft. were planed, 557,395,800 ft. B. M. hewn timber, which includes baulks, and roundwood, and 3,451,328 loads (600 ft. B. M. each) pit props and pitwood. The average c.i.f. (cost, insurance and freight) values, according to the official returns, were:—

| | | |
|---|---|---|
| Sawn and planed goods ... ... ... | per M. ft. B. M. | $25.35 |
| Hewn ... ... ... ... ... ... ... | per M. ft. B. M. | 37.86 |
| Pitwood and pitprops ... ... ... ... ... | per load | 6.18 |

The published figures for the Canadian trade show the pine deals average $37.00, and spruce and other deals at $20.60 per M.; planks and boards average $22.40.

Taking the London trade as a fair representation of the United Kingdom trade, the figures compiled by a leading brokerage house, which show the London import cost as averaging $25.10 per M., are interesting in that they show a steady upward movement in five years of prices equalling $3.40 per M. They also show that from 1904 to 1912 the total shipments from Russia gained 17 per cent., while Canadian and United States trade lost 8 per cent., and Scandinavian sources fell off 6 per cent. Russian goods in 1904 were 32 per cent. of the total, in 1912 were 49 per cent. Scandinavian proportions were, 1904, 33 per cent., 1912, 27 per cent., Canada and United States, 1904, 31 per cent., 1912, 23 per cent. Part of the gain in price is no doubt due to the difference in freight, as the Russian White Sea ports are dearer for tonnage than the Baltic ports, and the increased shipments have been drawn from that region. This difference will probably average $1.50 per M., and will account for that much of the seeming gain in value; a further rise in values, irrespective of the war's effects, was bound to come, as the Russian Government have not collected sufficient revenue, by stumpage or other taxes on lumber, to pay for what forestry service has been given, and an increase was under discussion before hostilities broke out. By present indications the taxes will be raised to make them as high as $3.30 per M. The above figures should be especially interesting to the British Columbia export mills as the impression seems to prevail there that Europe will take only the highest grades, and that no market can be found for something like 75 per cent. of the make because the Europena low freights will kill any chance of trade. The No. 1 common battens from the West Coast sent out for rail trade are but very little below the unsorted grade, and if the European trade is given thorough study there is not any doubt that a great deal more of the goods that now remain on hand after filling a European order can be advantageously sold there as well. Shippers also must grasp the fact that the European buyer makes his judgment on what he has seen of the goods, so if a first shipment should be exceptionally good, and subsequent shipment not so good, no amount of argument will convince buyer that he is getting what he contracted for.

### More Dressed Spruce Might be Shipped

It would appear worth the while of the Eastern Canadian spruce men to consider the advisability of making, and shipping, more dressed goods. Norway was pre-eminent in this direction for years, and her productions are still the most sought. But her shipments of planed boards have fallen off by one-third since 1906. Finland and Russia are bidding for the trade, but in view of the fact that the pulpwood industry is competing fiercely for a lot of the material suitable for either purpose it looks to be an opportune time to find out what there is in the trade for spruce. The 1913 price equalled $26.60 for unsorted White c.i.f. English Channel ports, and the St. Lawrence West Coast G. B. freight would be perhaps $1 above the freight allowed in this price. Also, the Welsh tin plate trade uses large quantities of box shooks (for casing exports, which in 1913 amounted to 290,000 tons of tin plates) and for which a deal of short lengths and waste could be utilized. The sizes are about 15 and 24 inches by ½ by 1 and 1¼ in., and tops and bottoms of ⅜th inch stuff 24 inches long to cover 15 inches wide (say one piece each 24 by 8 in. and 24 by 7 in., or 24 by 5, and 24 by 10 inch to make the lid or bottom respectively). A number of different sizes are called for in this trade, and that quoted is only to give some idea of the requirements.

This trade accepts various species, and elm, spruce, birch and beech are all featured. Ireland, and mills in the English midlands supply quantities of such goods, as the fact that shipments can be put down by liner parcels in Cardiff from the St. Lawrence at somewhere about the same rate as the combined rail and water rate from Ireland, and from there on the rate is the same, certainly warrant the expectation of getting hold of some of the trade for Canada. The Editor will be able to get names of buyers on request should any shipper be interested.

That Baltic white is advancing in value, and will continue so to do is beyond question. The pulp trade is growing enormously each year. Russia has doubled her wood pulp exports in four years; her exports to the United States in 1913 were 283,502,549 lbs. dutiable; Sweden's 6,114,768 lbs. free, 3,432,383 lbs. dutiable, and Norway 1,699,404 lbs. free, 188,252,055 lbs. dutiable, a total of 482,901,199 lbs., as against Canada's exports of 380,823,367 lbs., and 1,036,890 cords pulpwood. The diminution of suitable milling timbers, and the increased taxation are reflected in rising prices, and as this is in many cases the principal competitor of spruce, shippers should be especially active now, as any increased market secured at this time will be permanent.

### The Pitwood Trade

Much discussion has been taking place regarding supplies of pitwood, and pitprops. Props, or trees, are used to frame, and stand upright, and laterally, usually about 6 feet apart, in the mine roads. Pitwood is the lagging put between the walls and framing, and with the ends at each prop or lateral. Cogwood is used to build buttresses in the centre of a road, or chamber, where one or more props are insufficiently strong to hold the roof; is laid flat, and built up in tiers, the centre being made solid with rubbish. Sizes are sorted to half inch diameter. The props are usually 5 inch and up, pitwood 2 inch and up; lengths 6 ft. 6 in., 9 feet, and some 13 ft. Cogwood 3 ft. 3 in. and up; Imports would be about two-thirds 2½/7 inch 6 ft. 6 in., one-third 4/9 in. and up. The diameter would be about 90 per cent., averaging 5½ to 6 in., 10 per cent. 7/9 in. and up.

Of the total importation of mine timbers about forty per cent. was from France, Spain, and Portugal, 20 per cent. from White Sea ports, 5 per cent. from Norway, and the balance from Sweden, Russian Baltic (including Finland), and Canadian ports.

The United Kingdom Government interest arose from the absolute necessity of guaranteeing abundant coal supplies for the war fleets which use Welsh steam coal, and the only question was as to the timber supplies for the Welsh coal fields. The other coal districts have been working short time, or shut down, owing to restricted factory and other demand. Usually there is from three to six months imported supplies on hand in Great Britain.

The Welsh ports (Cardiff, Swansea, Newport, etc.) import 2,000,000 loads (equal to 781,250 cords 8 x 4 x 4 feet each) taking practically all the French, Spanish, and Portuguese exports, and a considerable quantity from other sources also. The French shipments should contain at least 5 per cent. of 9 ft. lengths and a good proportion of 8 inch and up diameter, which does not meet the entire demand for the larger goods, and the further need has been filled elsewhere. Of the smaller sizes, France, etc., can ship further quantities, but they are not needed. Canada can probably ship the larger size goods to advantage and get something more than the average price for them. The normal ex-ship price is about $15 per Fathom (equal to $8.90 per cord) and the freights to the Welsh ports run about:—

| | | |
|---|---|---|
| From France, Spain and Portugal ... ... | $3.00 to $7.25 | per fathom (216 cu. ft.) |
| From South Norway ... ... ... ... ... | 5.00 to 7.50 | |
| From Sweden ... ... ... ... ... ... ... | 5.50 to 7.50 | |
| From Russian Baltic (including Finland) | 6.50 to 8.00 | |
| From the White Sea ... ... ... ... ... | 8.25 to 10.80 | |

The French, etc., goods are not peeled, but a large part of the other shipments are, and any spruce shipments should be stripped of bark.

Payment is usually by sight draft in the Welsh trade, which is the one of most interest to Canada, and anyone interested should take up with the Cardiff Pitwood Importers' Syndicate of Cardiff, South Wales, and they will be able to get any details of current enquiries.

British Columbia should be able to increase materially her trade in Douglas fir by embarking on an aggressive selling campaign. It

is altogether a matter of educating the actual users as to its characteristics, as the general impression now is that it is equally as difficult to work as pitch pine, badly behaved during seasoning by liability to check and shake, refractory to creosoting or preservative treatment, and inferior in strength to longleaf pine, none of which is accurate. The leading European trade paper recently printed a reference to "Columbian pine shipped at deep water jetties in Seattle, and cut in the wonderful virgin forests of British Columbia, where trees run up as straight and true as a shaft for 300 feet or more." Taking the highest and lowest rates paid each year for freight on pitch pine the average for 7 years shows $11 per M. Douglas fir meets Southern pine competition on a 50c. rate to the middle west as against a 25c. rate of its Southern competitor—a differential of $7.50 per M., and the difference in freight to Europe should not be as much, so, reasoning from this, the market is open to assault.

Germany uses immense quantities of rough crate and packing case goods, and owing to her proximity to the Baltic export countries has the advantage of very low freights, so the prospects of increased trade seem largely confined to replacing longleaf pine by Douglas fir, and the ship-building centres of Stettin, Kiel, etc., and Hamburg in 1913 took 9,274,080 feet sawn, 30,522,171 feet lumber of longleaf pine.

Holland imports large quantities of baulks, and logs (in 1913 the totals were 82,000 and 538,000 pieces respectively) from the White Sea, the freight on which would approximate to the rate from Canada. Also her importation of sawn white wood is very heavy. Her 1913 import of pitch pine was 26,234,396 feet sawn, 79,562,916 feet lumber. The foregoing remarks on spruce vs. white, and Douglas fir vs. pitch pine apply here also, and the baulk and log trade should be taken up.

Belgium imported through Antwerp, in 1913, 419,600,000 ft. B. M., and with the goods received at her other port of Ostend her imports would approach 600,000,000 feet B. M. all told. Of this, pitch pine contributed 9,810,108 feet sawn, and 27,139,907 feet lumber. She does not offer the same chance to spruce as elsewhere, but Douglas fir sales could be increased.

France imported from Sweden 389,798,400 feet B. M. (of which 179,648,700 feet was white), from the Russian Baltic 49,399,100 feet, from the White Sea 35,899,400 feet, besides 26,234,396 feet sawn, 19,848,958 feet pitch pine, and considerable quantities from Finland. Her purchases include quantities of planchettes (sawn boards 1 x 4 and 4½ ins.) the normal price of same in white being $18.50 per M. f.o.b. The demand for lengths in metric feet is made very frequently. Canadian shippers should be able to improve their standing in this country very materially as the so-called sentimental reasons produced by the war have a real market value with the French people, and the rise in whitewood values already referred to are to the benefit of the spruce shippers.

Spain and Portugal import mostly red deals and are rather exacting in specification, seeking 3 x 8 in. and 3 x 9 in. in special lengths (14 and 16 feet) in large quantities. Pitch pine imports totalled nearly 80,000,000 feet. Conditioning needs to be more carefully looked after for shipments to these Southern European countries than for the States before mentioned, being necessary because of climatic conditions. If any chance arises to file a claim it will be heavier in damage than elsewhere.

### External Markets for Ties and Poles

The tie trade is bound to be very extensive in the near future, also the demand for poles for telegraph, and other lines, will be huge.

According to the 1914 returns the European mileage is nearly 170,000 route miles of track; with sidings, private-owned work tracks, etc., it will total more.

The British systems (about 25,000 route miles) require by the peculiar method of construction, a square tie (there called a "sleeper") 5 inches thick, 10 inches wide, 9 feet long.

The track is built up of ties, upon which a steel casting called a chair is bolted and in which the rail is lodged, and held in place by a wooden wedge (key). The chair is 7¾ ins. broad, so the tie must be 10 inches broad to give proper seating for the chair, and sufficient timber on each side to give the bolts a firm grip. About 2,000 ties are used to each mile, and about 1,500 miles have to be relaid each year, which calls for 3,168,000 ties per annum, which at 37½ feet B. B. per tie amounts to 118,800,000 feet B. M. Her imports for 1914 totalled 129,325,800 feet, averaging $24.13 per M. Prices have ranged from 60 cents to 84 cents c.i.f. cheap port, equal to $16 to $22.40 per M. on about $4 freight. Germany and Russia supplied the whole requirement hitherto, using top and irregular logs not otherwise convertible advantageously. The German and Russian Baltic supplies have been steadily decreasing, and the trade has been meeting the shortage by goods from the White Sea at increased cost. These imports have been practically all Baltic red, but of home grown goods quantities of oak, larch, and Douglas fir have been used, the last named (when home grown) is highly favored. The opinion regarding difficulty of creosoting western Douglas fir is held pretty generally in railway circles, and it is to be hoped that the recent shipments will remove this idea, and so open the market more fully than may otherwise be the case.

The Continental systems use the same track as the standard type of Canada, and are not nearly so exacting in specifications. They will take ties with 1 to 2 inches of wane on two top corners so long as base is 8¾ inches, top 6¼ inches, so as to give proper seating for 6-inch tie plates. They will also take half round ties (sawn top and bottom) 11½ inches at bottom, 6 inches at top varying, say, to 9-inch base, 8-inch top, all 5½ inches thick. In the next four years a large proportion of the French tracks will need to be relaid, as the present (oak and larch) ties have reached the age of decay, and these cannot be renewed in the two woods named, as they do not exist, so the needs must be met elsewhere.

### Export Requirement for Poles

Great Britain, France, and Belgium will make heavy requisitions for poles in the near future, and the prices paid some months ago will not fall away to the extent some other lines will. The specifications and prices are about as follows:—

Light poles 18 to 60 feet long. Length to step by 2 feet from 18 to 36 feet (i.e., 18, 20, 22 feet long, etc.) and step 5 feet from 40 to 60 feet; the smallest (18 feet) to be 5 to 5¾-inch top, and smallest diameter 5 feet from butt to be 6 inches. The longest to be 5½ to 7¾ in. top, 11 inches at 5 feet from butt. Prices range from 84 cents to $12.48 cents each delivered.

Medium poles 24 to 65 feet. To step 2 feet up to 36 feet, 5 feet beyond. Smallest 5½ to 6¾ inch top 8 inches below. Longest 7 to 9 inch top, 14 inches below. $1.80 to $20.16 delivered.

Large poles, 30 to 80 feet. To step 2 feet up to 36 feet, 5 feet beyond. Smallest 7½ to 9½ inches top, 10¾ inches below. Largest 8 to 10½ in. top, 18¾ in. below. $5.06 to $57.60 each delivered.

The longer poles should interest both Eastern and Western Canadian shippers, as it is always difficult to get ship room for these from the Baltic and White Sea, as the usual size of ships used in the trade is smaller than from Canada, and hatches and holds are smaller. Therefore most of the poles are carried as deck load, but as most of the steamers are well-deck type the largest sizes are usually carried by sailers pierced with bow ports.

Prophesy is never satisfactory, but reasoning will enable one to sum up the outlook for increasing Canada's lumber exports to Europe as very excellent; the demand is bound to be in excess of European production of such sorts as are made there, when the war ends. A large demand will have been created also for goods that cannot be made there, to replace destroyed public works, buildings, etc. European prices have been steadily rising, more markedly in white than red, and the sources of supply have changed in part to more distant points in Europe than heretofore, with a corresponding increase in freight rates. Freight conditions will right themselves soon. The trouble does not arise through direct diminution of tonnage but is on account of great congestion and delay at many ports whereby ships are only able to handle one cargo in such time as would normally suffice for two cargoes. This delay is growing less each day in most places. The tonnage that is withdrawn is only 28 per cent. of the world's total (reckoning vessels interned, or taken up by the governments as withdrawn) whereas the world's commerce has shrunk 40 per cent. since August, 1914. This shows 72 per cent. of the tonnage still available to carry 60 per cent. of the normal trade.

Finally, in those countries that buy most heavily of such goods as Canada can produce, the whole sentiment and goodwill of the merchants and people is enlisted on the side of the "Maple Leaf," so what is there to prevent trade following the flag if it is gone after properly and strenuously.

The statistics and prices shown above are for the year 1913, as it has been the writer's aim to show the trade under normal conditions, and he has therefore not used what figures are available since because they have been influenced by the war.

---

The Yellowhead Pass Lumber Company held its annual meeting at Cranbrook, B.C., recently. The financial report showed the company to be in a very satisfactory conditon. Officers for the ensuing year were elected as follows:—A. Carney, President; Lester Clapp, Vice-President; Joseph Ryan, Managing Director and Secretary; Directors, Messrs. Cock, Fenwick, Louis Johnson, A. E. Watts, and Isaac Burch. An option of purchase of the company's timber limits, 48 in all, situated in the Valley of the Fraser River above Fort George was granted to a prospective purchaser from England at a figure highly satisfactory by the directors and shareholders. This option continues until July 1st. If it is not taken up an option will be given to a prominent lumber operator of North Carolina, for sufficient time to complete an examination. It is estimated that the company's holdings include about 700,000,000 feet.

# Montreal Export Trade in Wood Goods

## Analysis of Shipments and Trade Conditions—The War's Effect upon Demand and Tonnage—The Pulp and Pulpwood Trade

(Contributed by our Montreal Correspondent)

FROM the export point of view, Montreal deals chiefly with the United Kingdom and the European Continent; the United States taking the next place, and South Africa the third. The port is splendidly equipped for handling the import and export of many kinds of commodities, but lumber shippers complain that they do not receive the consideration they are entitled to, and that the grain trade is given first place in the improvements that are carried out from time to time. Immense sums have been, and are being, spent to add to the facilities, and the contemplated programme will involve a further expenditure of $9,000,000. The season is from the beginning of May to the end of November, and during this period the shippers are very busy, particularly in the fall, when the date for the closing of navigation approaches.

Montreal exports to Great Britain and the European Continent have shown a declining tendency within the last few years. There are two main reasons for this—the cutting out of the best stock and the competition of Baltic lumber. The past season, of course, was exceptional in its general character, and the large falling off was almost entirely due to the war. Montreal is a pine and birch port, comparatively little spruce going to the other side. The harbor is favorably situated for the Ottawa and Ontario pine mills, and consequently the greater portion of the shipments are of that lumber. On the other hand, the mills manufacturing spruce are closer to Quebec than to Montreal, and the ancient capital controls that section of the trade. As timber limits have been depleted, lumbermen have had to go farther back to secure what is needed, and this has increased the cost of cutting and also of hauling. White pine, which forms the bulk of the exports from Montreal, maintain its own in the British markets, notwithstanding that the quantities for export tend to diminish and that the very high grade stuff is becoming more scarce; but as regards red pine another story has to be told. The enormous amount of red pine shipped from the Baltic has had its effect on the lumber sent from Montreal, the result being a steady diminution in our exports. At one time a very large quantity of spruce was shipped from Montreal, but the trade is now in the hands of Quebec firms. Owing to war conditions last season, the demand for spruce from the Old Country increased to a great extent, due in part to the shutting off of supplies from Riga, a partial stoppage of Swedish shipments, and increased consumption. These influences caused a rise in values, the upward movement being aided by the sensational advance in freights.

The following is a list of Montreal shipments from 1909, in feet B.M.:—

| Year | | Inc. or Dec. |
|---|---|---|
| 1909 | 114,872,849 | + 6,839,790 |
| 1910 | 117,806,706 | + 2,933,857 |
| 1911 | 103,473,220 | —12,882,176 |
| 1912 | 109,370,764 | + 5,897,544 |
| 1913 | 105,819,167 | — 3,551,595 |
| 1914 | 71,401,401 | —34,417,766 |

The following are the principal Montreal exporters to Great Britain and the European Continent:

Watson and Todd, Limited, with an office in Ottawa and an office and yard in Liverpool.

Robert Cox and Company, with an office in Ottawa, and an office and yard in Liverpool.

J. Burstall and Company, head office in Quebec, and a branch in London, Eng.

W. and J. Sharples, head office in Quebec, and an agency in London, Eng.

E. M. Nicholson, with agencies in Liverpool and Glasgow.

E. H. Lemay, with agencies in London, Liverpool, Glasgow and Belfast.

Graddon Lumber Company, Limited, with an agency in Glasgow, Scotland.

Cox, Long and Company, with office in London.

Thomas Mackarell and Company, head office in Ottawa.

Watson and Todd, Limited, are the largest shippers of pine deals and boards to the United Kingdom, principally white descriptions, while R. Cox and Company, E. H. Lemay, W. and J. Sharples, J. Burstall & Company, Dobell, Beckett & Company, and the Graddon Lumber Company ship red and white pine. Spruce is sent by Dobell, Beckett and Company, W. and J. Sharples, J. Burstall & Company, and E. H. Lemay. Mr. E. M. Nicholson is the principal exporter of birch; the Graddon Lumber Company, Dobell, Beckett & Company, J. Burstall & Company, W. and J. Sharples, E. H. Lemay, and R. Cox & Company, also send parcels of birch.

### The United Kingdom's Requirements

The United Kingdom takes 1st, 2nd, 3rd and 4th qualities of white pine, from 4 in. up, and from 6 to 16 feet. The red pine is mill run with the culls out, 4 in. and up, and 6 ft. and up, The spruce shipped is chiefly 4th, and better, 3 x 6 and up, 10 ft. to 16 ft.; while birch is sent in variouss qualities, 1 in. to 5 in. and 6 ft. to 16 ft. in length. A considerable quantity of birch timber is also exported. Ash, elm, birch and pine timber are shipped in fair quantities. Most of this is waney timber, with a small proportion of round and square.

The following are the steamship lines, with the ports at which they discharge lumber:—C. P. R., Liverpool, London and Avonmouth; Allan Line, Liverpool, London and Glasgow; White Star-Dominion, Liverpool and Avonmouth; Cunard, London, Plymouth and Southampton; Manchester Liners, Manchester; Thomson Line, London, Leith, Newcastle, and east coast ports; Donaldson Line, Glasgow; Elder-Dempster, Cape Town, Algoa Bay, East London, Durban, Delagoa Bay; Royal Line, Avonmouth; Furness Line, Hull.

The trade to the European Continent is not of great volume, and shows little variation from year to year. At one time a considerable amount of red pine was sent, but the closer proximity of the Baltic ports has caused this to diminish almost to the vanishing point. Havre, Rotterdam, Antwerp, and Hamburg were the principal points of destination of the goods sent last season, and birch and elm timber, white pine deals, and the better grades of red pine were the main products sent from Montreal. Prior to the war Antwerp took a considerable quantity of white pine deals.

### Shipments to South Africa

Montreal shipments to South Africa have been decreasing. In 1913 4,011,701 feet were sent to that country, but last season there was a greater call for spruce deals. The following quantities (superficial feet) of lumber were shipped through Elder-Dempster & Company, Limited, who have a direct service to South African ports:—

| | 1911 | 1912 | 1913 |
|---|---|---|---|
| White pine | 3,442,659 | 4,139,159 | 4,718,671 |
| Spruce and red pine | 4,615,905 | 3,226,622 | 3,951,387 |

A considerable portion of the exports came from United States points and also from Canadian points near Ottawa, being shipped through United States commission houses, on orders received through their South African agents. The principal shippers in Canada are Watson and Todd, Limited, for red pine, and W. and J. Sharples for spruce. There is also a fair quantity of hemlock sent.

The shutting up of the Baltic has in one way benefited the Canadian lumber industry, and is likely to lead to further developments. Owing to the impossibility of securing Baltic wood, there was a shortage of suitable lumber for match-making. Through the efforts of Elder, Dempster & Company, samples of aspen wood, a species of poplar, which had been regarded as of little value, were sent to South Africa. The results were satisfactory, and during the coming season a Quebec lumber firm will ship consignments of this wood, to be used by a match-making firm. The following Consular report upon South African trade is of interest:—

"To be successful in this trade, and this applies to all kinds of timber, it is necessary to send out the material absolutely up to specifications. The greatest care should be taken to ensure that the whole of the order is cut to the proper lengths. In fact great attention to detail is the prime factor in securing a reputation for exporters. It is a matter of complaint that some mills send out coarse grained stuff, or a part of the order will be coarse grained and part of it fine. However, it is gratifying to know that some mills, and one in particular, have already built up an excellent reputation. It will be seen that the greater part of the trade goes to the Baltic, the deals from there being said to be the best. It is stated that Canadian and United States deals do not stand this climate as well as the Baltic. If stacked for very long they are apt to split and warp. It is also said that Canadian exporters cannot supply the same variety of lengths, nearly all of theirs being 16 feet, whereas the requirements are from 10 feet to 30 feet length. Owing to the shortage of other kinds of timber, the imports of spruce are likely to increase, which will be a decided advantage to Canadian lumbermen."

A former business in Canadian doors has been discontinued, in consequence of the keen competition of United States manufacturers. Already space has been booked for a large quantity of lumber

to be shipped early this season. This will go from Three Rivers. The ruling rate of freight up to this year has been 70s. per standard, but it is certain that other consignments will have to be paid for at a much higher rate.

At one time Montreal sent a moderate quantity of lumber to New Zealand and Australia, but last season not a stick was sent through the direct service from the port.

### Changes in Shipping Methods

The export business has undergone considerable changes in the last few years. At one period it was not uncommon to send consignments of several hundred standards on one bill of lading. Now it is the practice to split up the lumber into much smaller parcels, to fill contracts, and for the British customers to take delivery, instead of the lumber being split up on the other side. The practice of sending complete cargoes has been practically abandoned. It is found that the smaller shipments are more convenient both for buyers on the other side and for the sellers. It permits greater control of the market to be obtained, and also facilitates delivery to the various firms who have purchased parcels under contract. Two of the Montreal shippers have yards in Liverpool, and in addition to sending goods on contract, stock these yards from shipments from Montreal. This is in many ways a ready means of disposing of the lower grades. The same firms hold stocks at Newcastle, Hull, and other large cities, from which they are able to supply their customers.

Lumber is transported to Montreal by two methods—rail and barge, the quantities thus sent being about equal. The cost of this shipment is considerable. The railroad rates from loading points to Montreal for export are as a rule framed on a basis of a cent per 100 lbs. below the ordinary freight charges, although from some points full rates are levied. The barge rate is, all things considered, cheaper, as the lumber can be loaded direct in the steamer, thus saving the cost of handling from railroad car to steamer, about 50 cents per 1,000 feet. The railway cars are brought right on to the harbor, the Commissioners having many lines, which of late have been extended. Port warden dues are charged at the rate of ½c. per 1,000 feet, and wharfage dues 8c. per 1,000 feet. Besides these charges, there are expenses for stencilling and checking.

Shipments to the various ports are made by freight lines, combined passenger and freight lines, and occasional tramps. The second greatly predominate in numbers, the companies having in addition to the passenger boats, which have only a limited cargo capacity, regular services of freight boats. Up to the commencement of the war, both passenger and cargo boats had regular schedules; the commandeering of vessels by the Government upset all arrangements, and from August until the end of the season it was difficult to secure space. Tramp steamers pay only a few visits to Montreal. The boats of the regular lines ensure, or did so until war was declared, a continuous service which leaves little room for the tramp so far as lumber is concerned. At the end of last year some carrying was done by this class of vessel, but then it was under special circumstances.

All the principal shippers make contracts at the beginning of the season with the steamship companies, or with such of them as they desire, a rate for a given period being agreed upon. The shippers on their part contract to send so much tonnage within that period, the rate of delivery for shipment being a matter of mutual arrangement during the season. Besides this, the steamship companies carry a considerable amount of lumber on through-shipment from inland points and also for a number of small Montreal shippers. The passenger boats generally take about ten days to reach the United Kingdom and the cargo boats fifteen days.

### Freight Rates—The War's Effects

The war caused what may be fairly termed a revolution in the freight situation, disturbing alike the steamship companies and the lumber exporters. At the beginning of last season the following were the general rates, per Petrograd standard (1980 superficial feet b.m.): Liverpool, 33s. 9d. to 35s. per standard; Hull, 40s.; London, 35s.; Glasgow, 35s.; Leith, 40s.; Newcastle, 40s. The almost immediate effect of the war was the taking off from the St. Lawrence route of a large number of vessels commandeered by the Government, making shipments of lumber slow and uncertain. As the season drew to a close the congestion became intensified, and at a time when normally the staff of every firm is working at high pressure to ship every stick before navigation closes, there was little or nothing doing. The shippers who had contracts were covered, but those who only exported small quantities, and those who shipped on through bills of lading, found freights go up against them rapidly. The regular exporters, too, who desired to ship beyond the amounts covered by contract had to pay the higher rates. In November the rate to Liverpool had jumped to 55s.; and to other ports in proportion, while as much as 60s. was paid from Montreal. This was by no means the limit, for this year as much as 135s. has been paid from St. John. As a rule, rates advance in the fall, owing to the extra insurance and the larger demand for space. The extent of the rise is also governed by the amount of cargo offering, both of lumber and general commodities.

The rates for the present season are, at the time of writing, in a very unsettled condition. The steamship companies are not sure of what tonnage will be available for the United Kingdom.

Up to this season the C. P. R. and Grand Trunk Companies issued cards giving rates from various points to the United Kingdom and the European Continent on the various classes of lumber, but this has now been withdrawn and rates can be only secured on application. The following are the varieties of lumber: Heavy—ash (black, white), beech, birch, cherry, dogwood, elm (rock), gum, hickory, lignum-vitae, maple, oak, persimmon, pine (pitch), pine (North Carolina), walnut, mahogany. Light—Basswood, butternut, cedar, chestnut, cottonwood, cypress, elm (soft), hemlock, pine (except pitch and North Carolina), poplar, spruce, sycamore, willow. By the term "lumber" is meant wood of all kinds, in the rough, including planks, boards, board-ends, scantlings, maple flooring, blocks, squares, strips, pailings, pickets, ties, poles, and on the character of wood involved the rate for heavy or light wood applies respectively.

The prospects for spruce for the coming season are excellent, provided that the shippers can secure tonnage. With the European supplies stopped, there is a splendid outlet for Canadian products, notwithstanding the increased prices inevitable under present conditions. In the belief that the United Kingdom would prove a profitable market, many mills have sold their output for that destination. The great call during the winter has been for spruce. Government requirements being a prominent factor in the situation. As to pine, the outlook is uncertain. The situation, so far as lumber shipments generally are concerned, turns on the tonnage available. During the close season in Montreal the shipping companies had more freight of every description offering than they could accommodate, and if, during the season now at hand, they can secure freight which will give better returns than lumber, it is certain that commodities like grain and flour will get the preference.

### United States Markets

Although a moderate amount of business is done with the United States by Montreal wholesalers, the port cannot be regarded as a centre for this section of the trade. Four firms, Mr. E. H. Lemay, the Campbell-MacLaurin Lumber Company, Limited, the Riordon Pulp and Paper Company, Limited, and the McLennan Lumber Company, Limited, do the chief part of the business. Several others do a fair amount of selling; while some firms in the province use the port as the medium through which to send their consignments over the border. The two first named houses have offices and representatives in New York, to which city and the immediate vicinity most of the lumber shipped through Montreal firms is consigned. Spruce is the principal wood sent, with moderate amounts of white pine, basswood, birch, ash, and elm, shingles, clapboards, and lath. The great call for spruce is 1 in., 1¼ in. and 2 in. x 9 x 13, boards and planks.

During the summer season large quantities are shipped from Ottawa points and from Quebec ports by American barges. These go via the St. Lawrence to Sorel, thence by way of the Richelieu River to Lake Champlain and down the Hudson River to New York points. The season lasts from May to November. Other lumber goes from various mills by rail, Montreal firms chiefly dealing with New York and cities and towns in the New England States.

The prospects for the present season for spruce for the United States are not bright, owing to the fact that many manufacturers, who in the past have sawn for the New York market, have sold a considerable portion of their output to be cut in 3 in. deals for the British market.

The cost of delivering lumber by rail is likely to go up, the extent depending upon how far the Dominion Board of Railway Commissioners will follow the lead of the Interstate Commerce Commission, which granted the American roads an increase of 5 per cent. The decision of the Railway Commissioners will affect both domestic and export traffic, as our railroads asked for additions to the rates for both sections of the lumber traffic. With falling receipts and higher operating costs the companies are compelled, they say, to make merchants pay more for the transportation of goods. The lumber trade, like others, is feeling the effects of the commercial depression, and the members see no reason why they should be further handicapped by the levying of additional rates for the benefit of companies which have received very substantial Government subsidies. In effect the higher rates mean the relief of railway shareholders at the expense of the general body of traders.

### Pulp and Pulpwood Exports

The growth of the pulp and paper industries in recent years has only been made possible by the development of the export trade. In this expansion the province of Quebec, with its immense resources of pulpwood and great water powers, has taken a prominent part. A large amount of capital has been invested in the construction of new mills, and many additions have been made to the older properties. As was only to be expected, certain enterprises have failed to realize

expectations, in some respects owing to the undue capitalization of the concerns; but on the whole, the results have been satisfactory. Fortunately, a halt has been called to the stock promotion propositions, and the industries are now on a more stable basis. Undoubtedly, the prohibition by the Government of the export of pulpwood cut from Crown lands has had a marked influence on the pulp and paper trades, by encouraging the erection of mills on this side of the border, instead of permitting our raw material to be shipped to United States mills.

The Government returns indicate that while Canadian ground wood exports have about held their own, there has been a very material increase in sulphite descriptions during the last two years. The exports of newsprint, too, shows a very substantial increase, the United States being a particularly good customer. Australia and South Africa also take large quantities of Canadian newsprint, much of the production going abroad by way of Montreal.

In addition to the large quantities of pulp sent by rail, thousands of tons are despatched by boat from the lower St. Lawrence ports to the North Atlantic seaboard. From points higher up, pulp goes by barge to the United States via the Niagara River. The Chicoutimi and North Gulf Pulp and Paper Company despatch considerable quantities of pulp to England.

The importance of the pulp exports can be judged by the following figures of exports:—

| | Chemically Prepared | | Mechanically Ground | |
|---|---|---|---|---|
| | Cwts. | Value | Cwts. | Value |
| 1910 | 864,606 | $1,658,846 | 5,038,850 | $3,545,751 |
| 1911 | 721,428 | 1,308,101 | 5,867,227 | 4,407,431 |
| 1912 | 835,239 | 1,587,535 | 5,023,568 | 3,506,770 |
| 1913 | 1,112,457 | 2,100,842 | 4,749,719 | 3,408,702 |
| 1914 | 1,515,633 | 2,923,083 | 4,816,170 | 3,441,741 |

The following table shows the exports of pulp to the United Kingdom, United States, and other countries:—

| | 1910 | 1911 | 1912 | 1913 | 1914 |
|---|---|---|---|---|---|
| United Kingdom | $ 931,150 | $ 496,928 | $ 674,361 | $ 828,133 | $ 167,882 |
| United States | 4,175,309 | 5,094,589 | 4,419,944 | 4,576,279 | 4,913,634 |
| Other countries | 98,138 | 124,015 | ..... | 105,132 | 283,308 |
| | 5,204,597 | 5,715,532 | 5,094,305 | 5,509,554 | 5,364,824 |

The exports of pulp wood were:—

| | Cords | Value |
|---|---|---|
| 1910 | 965,271 | $6,076,628 |
| 1911 | 936,791 | 6,092,715 |
| 1912 | 879,775 | 5,697,901 |
| 1913 | 1,003,594 | 6,806,445 |
| 1914 | 1,089,384 | 7,388,770 |

## Buying Agents for Allied Governments

The following list of purchasing agents for military purposes of the Allied Governments has been furnished by the Department of Trade and Commerce, Ottawa:—

International Purchasing Commission, India House, Kingsway, London.

**British—**

Col. A. G. Barton and Mr. F. W. Stobart, Ritz-Carlton Hotel, Montreal.

**French—**

Hudson Bay Company, 56 McGill Street, Montreal.

Capt. Lafouilloux, Hotel Brevort, New York.

Direction de l'Intendance, Ministere de la Guerre, Bordeaux, France.

**Russian—**

Messrs. S. Ruperti and Aleksieff, care Military Attache, Russian Embassy, Washington, D.C.

## European Enquiries for Pacific Coast Stock

At the first meeting of the Washington branch of the West Coast Lumber Manufacturers' Association, held in Seattle, E. J. Palmer, managing director of the Victoria Lumber & Manufacturing Company, Chemainus, B. C., volunteered probably the most interesting bit of news given out at the meeting. He said that in addition to the large inquiry from France for lumber recently received through the Canadian Government, and which has been a matter of common knowledge, another European inquiry asked what quantity of 1 and 2-inch dry lumber is at present in stock on the Pacific Coast, and his reply had been about 700,000,000 feet. These large foreign inquiries have heretofore not been very encouraging because of lack of bottoms and the high freights, but Mr. Palmer called attention to an encouraging feature of the situation. He said there are about twenty-nine German vessels interned in Australian ports and twelve of these have already been condemned by a prize court and are now ready for release, and will then be available for charters. In addition a number of German boats have been captured and are now in Chinese ports, and it is probable these may be condemned. Such a condition would remedy the great dearth of bottoms on this coast and make it possible to take some of this foreign business. The fact that the allies are demanding so much lumber even now is an indication that when the present struggle is ended there will be a tremendous demand for lumber from all of the European countries.

# Export Lumber and Timber via Montreal

**Specially Contributed by a Large Exporter**

Export conditions during the season of navigation via the port of Montreal in 1914 were, to say the least, chaotic and somewhat unprecedented. Business for the first part of the year, the world over, was extremely dull, and lumber and timber were naturally affected. The war, coming on, however, in August last, and consequent interruption to the steamship sailings, and the keen demand for ocean space on such vessels as were available, had a very far-reaching effect on the quantity exported, about 33 per cent. decrease, as shown by tables published elsewhere in this issue.

According to statistics compiled by the British Board of Trade, the timber imports into England, Ireland and Scotland for the year 1913 were approximately as follows:—

From Russia 50 per cent., from Sweden and Norway 25 per cent., from Canada and the United States 25 per cent.

Russian ports being mostly closed owing to the war, and Germany declaring lumber a contraband so far as Sweden was concerned, naturally led to a stronger demand being put on lumber from Canada and the United States, this demand, however, being almost entirely from the British Government for spruce, so far as Canada was concerned, pine not being in demand to the same extent. This demand for spruce has continued, but the high ocean freights running from 200 to 300 per cent. over those in effect in 1914 (prior to the war) has had, and will continue to have, a very serious effect on the lumber exports from Canada, these freights running from 80 to 100 per cent. and more on the cost of the lumber itself, practically a prohibitive condition.

On the cessation of hostilities, no one can accurately forecast what conditions in the lumber export trade will be, although it is within fair reasoning to say that owing to the interruption to the usual lines and the methods of trading in England, some time must elapse before conditions can readjust themselves, during which period an improvement in building and other trades into which lumber enters as a factor must be slow, to say nothing of the accumulated stocks in Sweden and Russia being then available for their usual markets. It will undoubtedly be conceded by the lumber trade, particularly in the eastern portion of Ontario, Quebec and the Lower Provinces, that the overseas lumber trade has a very considerable bearing on the entire lumber trade of Canada, for the reason that, were it not for this trade, naturally such logs as are now cut into export sizes would be cut into domestic sizes, thus adding to the available stock for consumption either in Canada or the United States, these markets now being taken care of without any such addition thereto.

The Panama Canal competition will also have a very strong bearing on the American markets, particularly so far as Canadian production is concerned, cheapening delivery from the mills on the Pacific Coast to the eastern American market and the export market, displacing, no doubt, considerable lumber which has heretofore got into these markets from Canada. Besides these features, the export market has to be provided for at least twelve months ahead and prices are consequently fixed accordingly, the domestic prices in the East being more or less regulated thereby. As one of the larger manufacturers in the East puts it, "The English market fixes the value for the domestic trade by contracting for what otherwise would likely be a surplus stock." It is usually the better end of the pine that is exported, for which there is not now a local demand, leaving the lower grades for the local and American markets, for which there is usually a steady demand, built up by this practice existing for so many years past, and being more or less the foundation for the trade enjoyed by the lumber industry as a whole.

If Canada is to increase her timber exports, this can only be done by careful study on the part of those interested in the lumber trade generally, so as to enable the exporters to meet foreign competition, including the new contemplated element entering into it—the Panama Canal. This competition has been growing steadily and stronger from year to year, resulting already in the displacement of some grades of pine entirely, which formerly were exported in large quantities, the question of price, grades, etc., of such foreign timber affecting the situation to a very great extent.

The costs incidental to exporting also enters into the marketing of our Canadian lumber to a very considerable extent, other sources of supply being nearer and consequently enjoying lower freight rates, besides which, unfortunately, the port of Montreal has been, and is

yet, apparently, being improved entirely with a view to taking care of the grain trade, while lumber and timber, which has always been a considerable factor in our Canadian exports, has been left to find practically its own facilities, there not being, as a rule, available room for the prompt discharging of cars into either the sheds or onto the docks in the vicinity of the sheds, in pracically all cases the lumber having to be teamed from the cars to the various steamship docks, piled and again re-handled before going into the steamers, whereas, had suitable tracks been provided, either into the sheds or alongside thereof, the lumber could be discharged from cars direct into the sheds or into the ships, one handling at least on the part of the exporters being obviated at a considerable saving, to say nothing of the saving by elimination of car demurrage, and the fact of the lumber reaching the foreign markets in better condition through not being exposed to the weather.

# Export Trade in Pulpwood and Pulp

## Shipments of Manufactured Article Increasing—Greater Domestic Consumption of Raw Material

A bulletin dealing with the production and consumption of pulpwood in Canada during 1914 has been prepared by the Forestry Branch of the Department of the Interior and will be published in the near future. The information contained in the bulletin was compiled from reports received from 49 firms or individuals operating pulp mills in Canada during 1914. These firms operated altogether 66 mills distributed as follows:—Quebec, 23 firms, operating 31 mills; Ontario, 15 firms, operating 21 mills; Nova Scotia, 5 firms, operating 7 mills; New Brunswick, 4 firms, operating 4 mills, and British Columbia 2 firms, operating 3 mills. Five mills operating in 1913 were idle in 1914. Four newly completed mills commenced operations in 1914 and two mills previously idle resumed operations during that year. The 66 active pulp mills in Canada during 1914 consumed altogether 1,224,376 cords of pulpwood, valued at the mill at $8,089,868. In addition to this home consumption a total quantity of 972,508 cords valued at $6,680,490 was exported in the manufactured state from Canada to the United States, making altogether a total production of pulpwood of 2,196,884 cords valued at $14,770,358.

Figures secured from the Department of Customs for the calendar years 1913 and 1914 show that there has been a steadily increasing proportion of Canadian pulpwood consumed in Canadian pulp mills. In 1910 only a little more than one-third (38.8 per cent.) of the pulpwood cut in our forests was manufactured into pulp in our own mills. In 1911 this had increased to 44.2 per cent., in 1912 to 46.9 per cent., in 1913 to 51.7 per cent., and in 1914 to 55.7 per cent. There was also a decrease in the actual quantity of raw pulpwood exported from Canada in 1914 as compared with 1913 of 62,522 cords.

The following table shows the amount of pulpwood exported unmanufactured and that manufactured in Canada during 1913 and 1914 together with the average value per cord:—

| | 1913 Cords | 1913 $ | 1913 Value per cord $ | 1914 Cords | 1914 $ | 1914 Value per cord $ |
|---|---|---|---|---|---|---|
| Production | 2,144,064 | 14,313,939 | 6.68 | 2,196,884 | 14,770,358 | 6.72 |
| Canada | | | | | | |
| Manufacture | 1,109,034 | 7,243,368 | 6.53 | 1,224,376 | 8,089,868 | 6.60 |
| Export | 1,035,030 | 7,070,571 | 6.83 | 972,508 | 6,680,490 | 6.87 |
| Quebec | | | | | | |
| Production | 1,432,594 | 9,495,165 | 6.63 | 1,323,917 | 8,882,899 | 6.71 |
| Manufacture | 629,934 | 4,107,689 | 6.52 | 636,496 | 4,148,405 | 6.52 |
| Export | 802,260 | 5,387,476 | 6.71 | 687,421 | 4,734,494 | 6.77 |
| Ontario | | | | | | |
| Production | 405,943 | 2,822,859 | 6.95 | 587,494 | 4,020,510 | 6.84 |
| Manufacture | 321,244 | 2,297,389 | 7.15 | 447,751 | 3,172,235 | 7.08 |
| Export | 84,699 | 525,470 | 6.20 | 139,743 | 848,275 | 6.07 |
| New Brunswick | | | | | | |
| Production | 194,674 | 1,449,525 | 7.45 | 193,126 | 1,382,315 | 7.16 |
| Manufacture | 53,121 | 342,243 | 6.44 | 49,339 | 296,769 | 6.01 |
| Export | 141,553 | 1,107,282 | 7.82 | 143,787 | 1,085,546 | 7.55 |
| British Columbia | | | | | | |
| Production | 84,242 | 402,428 | 4.78 | 80,013 | 426,444 | 5.33 |
| Manufacture | 84,173 | 401,218 | 4.77 | 80,013 | 426,444 | 5.33 |
| Export | 69 | 1,210 | 17.54 | ..... | ..... | .... |
| Nova Scotia | | | | | | |
| Production | 26,611 | 143,962 | 5.41 | 12,334 | 58,190 | 4.72 |
| Manufacture | 20,562 | 94,829 | 4.61 | 10,777 | 46,015 | 4.27 |
| Export | 6,049 | 49,133 | 8.12 | 1,557 | 12,175 | 7.82 |

During 1914 Canada exported 126,714 tons more of manufactured wood-pulp than in 1913, an increase of 42.5 per cent. While the increase in the exportation of ground wood was 36.4 per cent. that of chemical fibre was 63.5 per cent. This increase is partly due to the general advance of the industry in Canada and partly to the fact that while the capacity of pulp mills has increased in the last year the paper industry has not kept pace with the supply of pulp and the surplus of manufactured fibre has found a market in other countries.

The United States has been our most important purchaser of pulp in the past and the proportion of Canadian pulp exported to that country in 1914 was almost seventy per cent. of the total. Great Britain also buys large quantities of Canadian wood pulp, and these two countries together usually take the bulk of the exports from Canada. France imported Canadian pulp in 1914 for the first time since 1910. Other countries, including Belgium, Mexico, Australia, Cuba, New Zealand, and Newfoundland, have imported small quantities of wood pulp from Canada in the last five years, but the trade with these countries has varied greatly from year to year. The average price of exported wood-pulp changed very slightly. That of ground wood-pulp decreased by a few cents, and that of chemical fibre increased by about one dollar a ton.

### Pulpwood Export Regulations

In Ontario by an Order-in-Council dated January 13th, 1900, regulations were made by which the exportation of spruce and other woods suitable for pulp, cut on lands of the Crown was prohibited. Recently in severe wind storms there were blown down large quantities of pulpwood which would have been destroyed unless speedily cut and marketed, and as the market for pulpwood was more or less congested this "manufacturing condition" to which all sales and licenses had been subject was suspended for the season of 1914 and again for 1915.

In the province of Quebec an article in the regulations says that all timber cut on Crown lands in the province must be manufactured in Canada . This regulation came into force on April 26th, 1910. The regulation was changed during the last year so as to exclude mine props to be used in coal mines in Great Britain if shipped during the past season of navigation.

Similar legislation was passed in New Brunswick on April 26th, 1911, which was similarly amended with respect to pit props by an Order-in-Council dated October 15th, 1914.

There are no statutes prohibiting or regulating the export of pulpwood from the provinces of Nova Scotia or British Columbia.

The following table shows the exports of wood pulp during 1913 and 1914, their quantity, total value, and the average value:—

| | 1913 Tons | 1913 $ | 1913 Average value per ton | 1914 Tons | 1914 $ | 1914 Average value per ton |
|---|---|---|---|---|---|---|
| Wood-pulp exported aggregate | 298,169 | 5,913,560 | 19.83 | 424,883 | 8,865,436 | 20.87 |
| Total Mechanical Pulp | 230,644 | 3,317,565 | 14.38 | 314,485 | 4,509,260 | 14.34 |
| Total Chemical Pulp | 67,525 | 2,595,995 | 38.44 | 110,398 | 4,356,176 | 39.46 |
| Total to United States | 198,110 | 4,471,939 | 22.57 | 295,674 | 7,008,312 | 23.70 |
| Mechanical | 137,922 | 2,150,227 | 15.59 | 190,095 | 2,832,909 | 14.90 |
| Chemical | 60,188 | 2,321,712 | 38.57 | 105,579 | 4,175,403 | 39.55 |
| Total to Great Britain | 92,916 | 1,172,750 | 12.62 | 116,843 | 1,581,101 | 13.53 |
| Mechanical | 92,722 | 1,167,338 | 12.59 | 116,820 | 1,580,301 | 13.53 |
| Chemical | 194 | 5,412 | 27.90 | 23 | 800 | 34.78 |

### Pointers for Export Lumbermen

S. H. Cooke, 607 Cordova Street, Vancouver, B.C., in a recent letter to the press, offered a few suggestions that have been favorably commented upon by local millmen. Mr. Cooke said: "If the sawmills of British Columbia carried out a logical heart-to-heart talk with the public, relative to the 'labor-and-lumber' costs, I am positive that they could increase their production 25 per cent., which in turn would stimulate logging, which would revive hardware, revive this and that, till it passed all around, and hence, perhaps, it would be advisable for others than those interested in the lumber business to 'get busy.' Then Vancouver could win the phrase 'Vancouver has no slogan but business.'

"The lumbermen should recognize the fact that the lumber industry—served from the Baltic—in Europe, are careful to study European requirements. The dimensions and standards are entirely different from ours, and considering that we lost the Australian business through overlooking this fact, we might profit by the experience.

"It must be remembered that every piece of 'kindling' used in Great Britain is obtained from the Baltic. This is shipped in pieces 1¼ in. by 6 in. by 4 ft. It does not have to be 'clear,' dried or seasoned. This is interesting for the reason that it offers a field for a by-product of our mills, and such small pieces used to fill in with big square timbers, where space would be otherwise wasted, brings down the cost in freight.

"If you ask the average Englishman about Douglas fir, he thinks that you are talking automobiles. I am positive that, with publicity, fir would replace the pine shipped from the Baltic. For general construction, point by point, fir is far superior to Baltic pine—which is entirely different from American pine. That the Baltic have kept their trade is due entirely to their 'standard dimensions.' In this matter I speak with a knowledge of American and Continental experience in construction, and the lumber used on such work. Quality comes first in Great Britain and increased freight rates is no argument relative to that market, where lies a great field, and yet we murmur, 'hard times.'"

---

The attention of our readers is called to the advertisement of Norman S. Knox, 47 Wellington Street East, Toronto. Mr. Knox is offering a line of detachable lumber trucks for saw mills, planing mills, and lumber yards, which is particularly popular with the lumber trade. Catalogs will be forwarded on request.

# St. John, N.B. Lumber Trade Conditions

## Export Market for Deals Strong—Sailing Vessels Helping the Freight Situation—Local Trade Conditions Quiet

St. John, N.B., May 18th (Special to the Canada Lumberman):—During the past winter the state of the local lumber trade has been like many other things, simply marking time. Absolutely no new work was started, and all that was doing was cleaning up the old work from last season's contracts. All the factories were running short time and there was hardly enough work to keep a small crew busy. In St. John, at the present time, no great amount of new work has been started. The only large contract in view at present is the new building to be erected for Scovil Bros. & Company, clothiers, just adjoining their old premises on King Street. During the past week business has seemed to pick up, but people lack confidence, and, under the depression are moving very cautiously, but it only needs some decisive victories at the seat of war to restore this confidence, at least to a limited degree. Many people have plans of homes, and real estate companies also have many plans for building, but are holding up the work until things brighten up, when it is felt that the building trades will again move along at a good pace.

Prices on low grade stocks are being shaded as the lumber merchants are pushing each other for business, and the factories are also making cuts here and there to try to get the work. Persons who have more or less decided to build houses would do well if they went on with the work, as contractors are doing just what the suppliers of material are: cutting close to get work. So, taking it all around, one can build cheaper this season than last, and when confidence is restored and trade moves up, wages, lumber and material of all kinds will naturally advance.

Refuse lumber of all kinds is off, from $1.00 to $1.50 per M. under last year's prices. Hemlock boards for boarding-in purposes are also easier. The market in all boards, both spruce and hemlock, is overstocked. The American market, which usually takes considerable quantities of these boards, is very much depressed, and it is not a question of price, but of getting a buyer. But it is now felt that the worst is over in the building trades here. Enquiries have been coming to hand during the past week, which goes to show that people are awakening, and much work which has been held up in the house-building line will go on. There are practically no vacant houses in St. John and builders say that if they could get the credit they could sell the houses without any trouble. East and West St. John must develop, as these two parts of the city are bound to become the residential parts of the city, especially the west side. In a month or two the only drawback will have been eliminated, that is, the car service of west and main St. John will be linked together as one line. By the finishing of the new bridge over the Falls many lots have been purchased, and there are more opportunities to buy the best of lots in the best part of the city.

In the wholesale lumber business this has been more or less of a troublesome year, the greatest drawback was the moving of the stocks which were sawn last season. These stocks of the local mills were in the hands of the exporters, viz., W. Malcolm MacKay, J. E. Moore & Company, Geo. McKean Company, and one or two others, but yet a portion of this stock remains at the mills, as the buyers could not get tonnage enough at any price to move their stocks. Freights began to rise last August after the war broke out, starting largely at 50 shillings per standard until as high as 140 shillings has been paid from St. John to British ports, the buyers could have had considerable tonnage even when it got to 100 shillings, but they thought it would ease. Instead it began to grow scarcer and to go higher, Many sailing vessels have been fixed to load at 120 to 130 shillings, and St. John is now beginning to look like old days, when square riggers were the great movers of deals. Many vessels arrived during the past few days and probably all the old deals will be cleaned up within a month. A good quantity of portable stock is now held here in scows awaiting shipment, as tonnage not being available during the winter, the portable mill stock coming in cars was forced to be unloaded into lighters and held.

At the present writing about all the cut of deals for the coming season, both here and through the province, have been sold, largely around $19.50 for a specification running 50 per cent. 7 in. and 8 in. x 3 in., balance 9 ft. x 3 in. and up. This is $2 per M. higher than ever before received, but at present not a bid is being made for any new deals for sale, as the exporters are refusing to take any chances. They claim that considerable Swedish stock is finding its way into England, much more than was anticipated, and it is said that deals are easier on the English side. Stocks are not heavy and if freights can be had, no doubt the market will absorb all the stock to be made here.

The mills are not all sawing English deals, but very little stock is being sawn for the American market. Messrs. Randolph & Baker are not sawing as yet, and it will probably be July before they do so, as they are entirely rearranging their mill with a double cutting band mill and a band resaw, all supplied by the Berlin Machine Works. They have thrown out both their old live gangs and when the mill is remodelled it should be one of the best on the River St. John. Messrs. Murray and Gregory, Limited, are sawing entirely for the English market, and J. E. Moore for the English market. Estate Chas. Miller, and Miller Moore & Company are both sawing logs for Stetson Cutler & Company, mostly for the English market, with the exception of some narrow sizes. Messrs. Stetson & Cutler are sawing English and American combined. The stock coming from Stetson Cutler & Company's mills is largely sawn from logs cut in the State of Maine and is much longer and of a broader average than that manufactured from ordinary short English deal logs.

Stocks of English deals are now fairly light at St. John, and the only excess of stock is that made through the winter by portable mills throughout the country. This is now being brought out by the rivers and will be shipped out as opportunity comes. It is of a much inferior grade, both as to lengths, widths and manufacture, but it is mixed up and sold as lower port stock, the mills at St. John being largely used to sweeten up with because of their better manufacture. This stock is coming into competition more and more each year with city cut stock and demands about as much money.

It is to be hoped that the market will keep steady, so that the mills will be able to operate all through the summer, for, with the mills forced to stop sawing this season would be a very hard one in St. John.

Ten millions of deals would cover all the stock, old and new, portable sawn, at St. John. On the north shore of the province about all the English stocks have been shipped either last fall or during the winter.

Laths are keeping fairly well in pace with deals and have not weakened to any extent. Stocks are very low and are bringing about $2.75 to $2.80 on wharves at St. John. A few old laths still remain but these are now being loaded on vessels for shipment.

The shingle market remains very unsteady and it is very hard to sell the extras and clears at any price. The 2nd clears and Ex. No. 1 are pretty well taken up, but no heavy demand is being felt, and any excess of stock on the market will make it almost impossible to do anything. Prices locally are: extras about $3.25, clears $2.85, 2nd clears $2.50, Ex. No. 1 $1.70.

The box business is in a state similar to all other classes of wood goods, and it is hard to find business, but the worst of the box season is now over.

The logs in the St. John River have just begun to run; it is too early to forecast whether all the drives will get in. Yesterday it was said that unless more rain came the drives which are in the upper St. John corporation would not reach the booms this year. This will mean a hang up of at least thirty million feet, which will materially decrease the stock to be manufactured at St. John, but it is hoped this will not occur. The cut this year for St. John would total, if all were in, about seventy million feet.

---

### New Brunswick Export Trade

The exports of lumber from St. John, N.B., to transatlantic ports last year amounted to 84,027,826 superficial feet of spruce, and 7,651,-181 superficial feet of birch plank with 1,411 tons birch timber, compared with 80,714,861 superficial feet spruce, 5,823,761 superficial feet birch plank, and 2,307 tons birch timber in 1913.

The following table gives the shipments from New Brunswick ports during the last three years.

| Port | 1912. Ft. | 1913. Ft. | 1914. Ft. |
|---|---|---|---|
| St. John | 76,846,726 | 80,714,861 | 84,027,826 |
| Dalhousie | 15,909,671 | 16,000,000 | 12,000,000 |
| Bathurst | 7,615,378 | ..... | ..... |
| Newcastle | 33,494,529 | 22,103,758 | 26,126,424 |
| Chatham | 45,623,040 | 52,384,955 | 35,945,187 |
| Richibucto | ..... | 1,594,990 | ..... |
| Buctouche | 287,556 | ..... | 253,354 |
| Campbellton | 35,152,226 | 54,351,943 | 37,370,151 |
| Out Ports of Sackville. | ..... | 8,527,876 | ..... |
| Sackville | ..... | ..... | 392,198 |
| Albert | ..... | 15,669,408 | ..... |
| Shediac | ..... | 3,792,069 | ..... |

Four years ago the total exports from the Province to trans-Atlantic ports amounted to over 280,000,000 feet, compared with less than 200,000,000 feet this year. The names of the shippers from St.

John last year, with the amounts of spruce lumber shipped were as follows:—

| | 1913. | 1914. |
|---|---|---|
| W. Malcolm MacKay | 32,668,873 | 37,703,517 |
| J. E. Moore & Co. | 22,868,067 | 19,548,966 |
| George McKean | 17,943,693 | 22,417,059 |
| Other shippers | 7,234,228 | 4,358,284 |

The exports of lumber, pulp and pulpwood to the United States last year showed a slight decline in value over those for 1913. The statement by quarters follows:—

| | | |
|---|---|---|
| First quarter | $ 297,539.34 | $ 195,255.95 |
| Second quarter | 452,141.61 | 531,509.33 |
| Third quarter | 405,647.40 | 539,876.41 |
| Last quarter | 370,140.24 | 203,388.41 |
| Totals | $1,525,468.59 | $1,470,030.10 |

# Cooperage Stock in Export Markets

## Requirements of Other Countries—Important Trade for Canadian Goods in Many Foreign Markets

**Contributed specially to the Canada Lumberman by J. Innes**

The market for cooperage stock abroad is a very important one, but is practically in the hands of a few manufacturers who cater to the specifications required by foreign countries, which are not generally the standard specifications on this continent. Metrical measurements are used in a great many cases. In others the English standard is used, so that the export business is confined to manufacturers who are willing to specialize in this trade. The war has affected shipments seriously. The demand is good, but freight room is hard to secure. Freight rates have trebled, quadrupled and in some cases are even worse than this.

The German, Austrian, and in fact the whole of the Baltic markets are practically closed, and these markets consumed a lot of tight barrel stock. On the other hand, the demand for Mediterranean ports has increased as these ports drew their principal supplies from Austria and Russia, in the former case slack barrel and in the latter case, tight barrel stock; while a large quantity of slack barrel stock was imported from Norway and Sweden and these countries find difficulty in getting freight room.

Canada and the United States ship large quantities of tight barrel stock to nearly every foreign country, France, Germany and Italy being the largest consumers.

Slack barrel stock is exported principally to the United Kingdom, Jamaica, Cuba, South America and Mediterranean ports, other countries only buying in small quantities, occasional car loads principally.

Staves and heading exported are for oil, syrup, wine, spirit, herring, olives and all kinds of liquids, being made from white and red oak, ash and gum, and for flour, sugar, bottling, cement, lime and all other kinds of slack packages, made from elm maple, birch and poplar. Hoops made from elm.

Most foreign buyers prefer to deal with Canadian firms as they know the export demand and keep strictly to the standards required in the different countries, and do not try to substitute something "just as good" or to have the foreign buyers conform to their own ideas, but give them what they want.

The chief export markets for Canadian cooperage stock are Great Britain and Ireland, France, Italy, Holland, Germany, South America, West Indies, Australia and South Africa.

In Great Britain and Ireland there is a demand for our slack barrel, white oak pipe, hogshead barrel and keg staves, red oak hogshead staves, both rough and dressed; also flat dressed heading. Some shipments of oil and glucose staves and heading are also made to these markets.

France takes white oak claret staves principally, some rough hogshead and barrel staves and heading.

Italy takes wine staves principally 34 to 36 x 1-in., oil, pipe and hogshead staves and heading for olive and vegetable oils.

Holland and Germany have in the past been markets for pipe hogshead and herring staves, mostly in the rough. Large quantities of oil staves and heading are also used in Germany.

South America takes tight barrel shooks, slack barrel shooks and staves and heading of various dimensions for all kinds of packages, which are made up locally.

The West Indies takes rum, molasses and sugar shooks, in white and red oak, orange and pineapple shooks, and slack barrel stock. Very little dressed or rough staves are used in the West Indies.

Australia takes principally dressed white oak staves and heading. Some red oak stock is also used.

South Africa takes rough white oak staves and heading, but more dressed white oak staves and heading.

Business customs in connection with the cooperage export trade are as follows:—

Credits are usually opened by buyers in London, New York or Montreal so that drafts may be drawn on bankers at these ports on approved credits at 30, 60 or 90 days. All drafts are attached to bills of lading, invoices, inspection certificates and insurance policies where goods are sold cost, freight and insurance. If sold cost and freight only, insurance is left to the buyers or their agents.

Freight rates are governed by other goods being shipped. Dunnage rates are sometimes secured especially for rough and dressed tight barrel staves and heading, but shippers must be careful if shipping at dunnage rates (which are nominal) to specify that they are guaranteed against damage by lubricating or other oils or anything else which will spoil the stock.

Insurance rates (except in war times) are low on liners; being one-eighth of 1 per cent. and sometimes even lower. On tramp steamers and sailing vessels rates are higher, one-quarter of 1 per cent. to 1 per cent. being demanded according to the class of vessel.

The trade in slack barrel stock meets with competition from Norway and Austria, which are the principal countries looking for export markets. Germany produces 25 per cent. of its own requirements.

Russia is our largest competitor in tight barrel stock; then Austria and to a small extent Germany. The United States produces more tight barrel and slack barrel stock than all other countries combined, and Canada comes next.

The export trade is a large one and is growing. Canada unfortunately has wasted millions of feet of available timber, and is consequently unable to export much tight barrel stock, but is still in a position to meet world competition in slack barrel stock, and the manufacturers here depend on the export business to a very large extent.

The export market is a close one and manufacturers have to work on a small margin to compete with the United States, Norway and Russia, but the excellence of Canadian products gives them the preference and foreign buyers like to deal with Canadian houses, as invariably they endeavor to make their word as good as their bond.

### Currency and Measurements Used in Export Markets

British and Foreign currencies and measures of length with their Canadian equivalents are as follows:—

| Country | Monetary Unit | Canadian Equivalent | Measure of Length | Canadian Equivalent |
|---|---|---|---|---|
| United Kingdom | Pound or sovereign. | $4.86 2/3 | Same as Canadian | |
| British Possessions, viz:— | | | | |
| Antigua | Pound | 4.86 2/3 | Same as Canadian | |
| Australian Commonwealth | " | 4.86 2/3 | Same as Canadian | |
| Bahamas | " | 4.86 2/3 | Same as Canadian | |
| Barbados | " | 4.86 2/3 | Same as Canadian | |
| Bermuda | " | 4.86 2/3 | Same as Canadian | |
| British Guiana | " | 4.86 2/3 | Same as Canadian | |
| British S. Africa | " | 4.86 2/3 | Same as Canadian | |
| Dominica | " | 4.86 2/3 | | |
| Grenada | " | 4.86 2/3 | | |
| | | W. F. | | |
| Hong Kong | Dollar | .8701 .903 | | |
| Jamaica | Pound | $4.86 2/3 | | |
| Montserrat | " | 4.86 2/3 | | |
| Newfoundland | Dollar | 1.01388 | | |
| New Zealand | Pound | 4.86 2/3 | | |
| St. Kitts | " | 4.86 2/3 | | |
| Nevis | " | 4.86 2/3 | | |
| St. Lucia | " | 4.86 2/3 | | |
| St. Vincent | " | 4.86 2/3 | | |
| Trinidad & Tobago | " | 4.86 2/3 | | |
| Argentine Republic | Peso | 96.5 cents | Metric. | |
| Belgium | Franc | 19.3 " | " | |
| Brazil | Milreis | 54.61 " | " | |
| | | W. F. | | |
| China | Shanghai tael. | 1.20775 .885 | 10 fun = 1 tsun = | 1.41 E. in. |
| | ‡Haikwan tael. | 1.20975 1.000 | 10 tsun = 1 chek = | 14.1 " |
| | | (See note) | 10 chek = 1 ch'eung = | 141 E. in. or nearly 4 yds. |
| Columbia | Dollar | $1.00 | Metric. | |
| | | | Vara | 38.874 in. |
| Cuba | " | 100 cents | Metric. | |
| Denmark | Krone | 26.8 " | " | |
| | | | Ell | 2.06 ft. |
| France | Franc | 19.3 " | Foot | 1.03 ft. |
| German Empire | Mark | 23.8 " | Metric. | |
| Japan | Yen | 49.8 " | " | |
| | | | 10 bu = 1 sun = | 1.193 in. |
| | | | 10 sun = 1 shaku = | 11.93 in. |
| | | | 10 shaku = 1 jo. = | 119.3 in. |
| Mexico | Peso | 49.8 " | Metric. | |
| | | | Vara | 32.9 in. |
| Netherlands | Floria | 40.2 " | Metric. | |
| Norway | Krone | 26.8 " | " | |
| | | | Fot | .974 ft. |
| Russia | Rouble | 51.5 " | Sajene = 3 arshins | 7 ft. |
| | | | Arshin = 16 vershoks | 28 inches |
| | | | Russian inch | English Inch. |

Note.—The average value of the Haikwan Tael for 1908 was 65 cents; 1909, 66 cents; 1910, 69 cents; 1911, 65 cents, and for 1912, 74 cents.

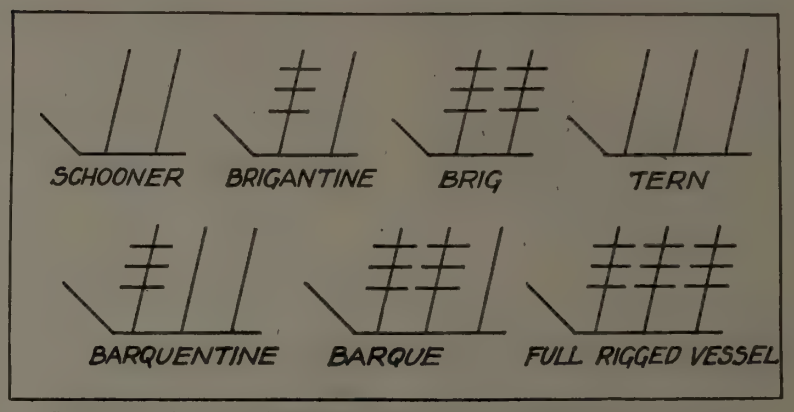
‡The values in Chinese Imperial Customs Returns are always given in Haikwan taels, which are relatively in value equal to about 1.113 Shanghai taels. The tael is in reality not a standard of value (there is no such coin), but of weight, and when used in the sense of a value it only represents its weight in gold or silver, as the case may be, the real difficulty is to establish its exact equivalent in grains.

# Nova Scotia's Export Trade in Lumber

## The Rise and Development of the Trade—Its Relation to the Shipping Industry.

Written specially for the Canada Lumberman By Elihu Woodworth

THE greater part of the lumber exported from Nova Scotia finds a market in the United Kingdom of Great Britain and Ireland. That market takes practically all the deals shipped, all the ton timber and a considerable portion of the battens and scantling. The other lumber exports, consisting chiefly of spruce and hemlock boards, laths and scantling, go to the United States, the West Indies and South America. Large shipments of piling are made to the United States from some parts of the province, and large quantities of pulp wood were formerly exported, but a home market for this class of wood has been created by the erection of pulp mills in the southern and western parts of Nova Scotia. These mills consume about 25,000 cords of pulp wood annually and turn out about 50,000 wet tons of pulp, worth $400,000. In the eastern part of the province the trees such as are elsewhere used for pulp wood are converted into pit props and find a ready and unfailing market, It is estimated that the quantity of wood used annually in the mines for props is twice as large as the quantity required to supply the pulp mills. The demand for pit props is steadily increasing, and a commission has been appointed to investigate the problem of supply, but it is believed that with proper care the supply of small spruce will continue to be equal to the demand. Among the exports are occasional shipments of lumber unlike any of the kinds already specified and somewhat difficult of measurement and classification. For instance, one firm exported last year 3,400,000 dowels, varying in length from twelve inches to four feet. Two large cargoes of maple logs have been exported from Parrsboro this season to be made into lasts, and occasionally a cargo or part of a cargo of black spruce poles is exported from Cumberland County to Boston or New York to be used for boat masts, flab poles and props for clothes lines.



Diagrams showing rigging of Ocean Going Sailing Vessels, from information furnished by F. G. Wheaton.

### Beginnings of the Export Trade

The lumber export trade of Nova Scotia began about one hundred and forty years ago, when some of the early British settlers commenced shipping ton timber—birch logs hewed square—to England. The price obtained per ton—forty cubic feet—was twenty shillings, which does not differ very materially from present quotations. The export of ton timber led to the shipment of spruce deals to the British market, and the trade thus established had a rapid development which was for a time very profitable to the exporters through the demands caused during the wars of Napoleon by the closing of the Baltic.

The growth of the export trade led directly to the development of the wooden shipbuilding industry in Nova Scotia. Lumber could not be exported without ships, and ships of any kind were not easily obtained. The lumbermen were equal to the emergency. They utilized the crooked logs, which were of little value for lumber, and built sturdy brigs, which, if not so finely finished as modern vessels, were at least staunch and seaworthy and were good carriers. As the export trade expanded, these vessels were succeeded by barks and ships, and vessels of even increasing tonnage were turned out from the numerous shipyards, until Nova Scotia had a fleet of which her people were justly proud, and Nova Scotian ships were seen on every sea. But a change came which proved somewhat disastrous to many shipowners. The Board of Trade in their praiseworthy solicitude for the safety of seamen condemned a large number of ships which had seen their best days, and thus practically put them out of commission so far as their owners were concerned. If the old ships had been destroyed they would have been replaced by newer and better vessels and the lumber trade would have suffered little interruption. But instead of that course being pursued the condemned vessels were sold for a song to the Norwegians, who fitted them up with windmills to do the required pumping, and, in many cases, changed their names. These vessels, representing a small outlay of capital, paying low wages and very cheaply outfitted, were at once placed in competition with the costly and well-found ships of the provincial fleet. Under these conditions and with no insurance to pay, it is evident that the Norwegian and other foreign owners could easily underbid their competitors and could carry lumber profitably at prices which would not pay the running expenses of the home fleet. There was little encouragement to build more ships under such conditions, and besides that, big ship-timber was less accessible than in former years. Many of the shipyards in Nova Scotia were closed and the others were chiefly devoted to the building of schooners for the coasting trade and for the fisheries. Larger vessels were built from year to year as the demand increased, until the province now owns a fine fleet of handsomely modelled and well-built three-masted schooners with an occasional four-master among them, while a large fleet of smaller craft with yacht-like lines and handsome, up-to-date rig and outfit are engaged in the fisheries.

### Entrance of the Tramp Steamers

While the reorganization or readjustment of the provincial fleet was taking place another change occurred which was destined to have a marked effect upon the export trade in lumber. Some twenty years ago a few tram steamers came to Nova Scotia looking for deal cargoes. They were able to compete with the Norwegian and other foreign sailing ships in prices, and as they could give greater dispatch and carry larger cargoes, they were better adapted to meet the requirements of the exporters. As a natural consequence they soon had entire control of the lumber trade to British markets. The Norwegian and other ships which had driven the home fleet out of the home market had, in their turn, to give way to the steamers. The triumph of steam over sail appeared to be complete, and the new condition promised to be permanent. This spring, however, another change developed. Lumber operators, who had largely increased their output on account of the advance in prices, found that owing to war conditions very few if any steamers could be obtained. Wooden ships were no longer available; the steamers which had supplanted them were employed elsewhere; lumber prices were soaring in England; freights were advancing by leaps and bounds, and the problem that confronted the lumber operators was how to find bottoms to transport their output. At this junction it was suggested that our larger schooners might be employed in carrying lumber to the British markets, but the objection was at once made that only square-rigged vessels were suitable for ocean voyages. However, as the demand became increasingly urgent, a considerable number of schooners accepted charters and commenced loading. Several of these have gone across safely, others have started on the voyage, while many others are loading or preparing to load. One schooner which was caught in a gale, lost her sails and had a rough experience generally, but she fared as well as a lumber-laden bark that was out in the same storm. In fact this vessel's experience appears to have demonstrated that, contrary to the belief that has long been generally accepted, a staunch schooner with good sails and gear will make as good a showing on an ocean voyage as any square-rigged vessel.

And now a word concerning freight charges. The rates of freight on lumber fluctuate very much as they do on other commodities. Sometimes they are very low—much too low for a living profit, as seen from the ship-owner's point of view. Sometimes they are so high that they are regarded as profit-killers from the exporter's view point. Many millions of feet have been shipped at from thirty shillings to forty shillings, and frequently the price has gone above forty shillings, so that the average rate during the last twenty years has been about thirty-eight shillings per standard. Last fall a few cargoes were shipped at a small advance on fifty shillings, but never before within the memory of man have freights soared to their present altitude, when the current rate is 130 shillings per standard. The rates

on lumber to South America have also shown a mavellous advance. A few years ago cargoes were carried at $6.75 per thousand feet, and ten dollars per thousand was, until recently, considered good business by the vessel men. Now the rate has soared to $21 per thousand, and bottoms are not easily obtained even at that price. Shipowners are reaping a rich harvest and can well afford to pay the added cost of war insurance.

### Details of the Nova Scotia Export Trade

The different kinds of wood cut in Nova Scotia for export may be divided approximately as follows: spruce 60 per cent., hemlock 20 per cent., pine 10 per cent. Spruce, in one form or another, finds a market in Great Britain, the Eastern States, the West Indies and South America. Hemlock goes chiefly to the United States and particularly to New York. The most of the pine is sent to the West Indies. Hardwood, which ranges from five per cent. to 10 per cent. of the total output, according to circumstances, goes almost exclusively to the British market in the form of deals or ton timber, but occasionally a cargo of a specified kind is shipped to the United States to order. The only exporters engaged in the ton timber business at present are Messrs. J. D. & P. A. McGregor, Limited, of New Glasgow, to whose courtesy I am indebted for information received. They have not been shipping so much timber as in former years, but they still handle some every season. Their maximum shipments in recent years have been about 2,500 tons, or 100,000 cubic feet, but their output some seasons has fallen to 500 tons. Nearly all the timber they export is made by farmers off their own lands, and very much depends upon the current prices and the kind of winter. If there happens to be much other lumbering in progress in the district where it is made very little ton timber will come out. The timber is always sold as birch, but occasionally a few pieces of maple or elm are shipped with it. The buyers, however, object very strongly to taking any beech. Most of the timber now shipped is made in the eastern part of Picton County and the western part of Antigonish and is hauled out to various points along the railway. The average size of the timber is fifteen inches, but occasional pieces are still brought out that will measure up to twenty-eight inches. The growth of hardwood is so slow that the available supply of big trees is becoming scarce, but if the proposed Guysboro railway is built, as it undoubtedly will be sooner or later, and is fairly certain to be at once, it will give access to wide tracts of virgin forest and should open up a large quantity of hardwood suitable for this trade. The chief markets are Liverpool and Glasgow with occasional shipments to London and Bristol. In the old days great quantities were shipped from Pictou in the wooden sailing ships, but now it nearly always goes forward in the Liners from Halifax, although small lots are occasionally shipped with the deal cargoes from Pictou. In the old days large quantities were shipped from various ports in the province, and old shipmasters tell marvellous tales of timber that measured up to three feet square, but the old times are departed, never to return, and while the trade in ton timber lasts it will be held exclusively by the eastern part of the province.

It is evidently of little use to attempt to forecast the outcome of the present extraordinary conditions. If it had been known six months ago that the war would continue until now without any indications whatever of a speedy ending, it is probable that more ships would have been built, although very few could have foreseen the abnormal advance in freight rates. As it is, the vessels that were being built have been rushed to completion or are being rapidly finished. Their owners will receive part of the benefit of the war prices, but some of them do not care to venture further for fear of the inevitable slump in freights which must occur when peace is restored. It is true that the demand for lumber in Europe may be even greater when the war is ended than it is at present, but the Baltic ports will then be open and will have the advantage of being comparatively near to the places where lumber will be needed. Then, too, many of the steamers now employed elsewhere will be released and will be seeking lumber freights with their old time readiness to cut prices, so that it really seems practically impossible that the present freight rates or anything near them shall continue very long after the war is over. Meanwhile the lumber operators and the fortunate owners of vessels are using every effort to take the fullest advantage of their very unusual opportunities, and are not, as a rule, taking the trouble to peer very far into the future.

---

The importation of matches into the West India Islands is extensive, but Canada seems to have done nothing to share in the trade. Although there is a large match factory in British Guiana that country imported 3,586,680 boxes of matches in 1914 from the United Kingdom, Denmark, Norway and Sweden. Trinidad imported 6,240,160 boxes. Barbados imported 2,007,840 boxes from the United Kingdom and the United States. The Leeward Islands imported in 1913, 1,984,080 boxes. Thus the colonies within the preferential agreement import annually over 16,500,000 boxes of matches. Jamaica imported last year 5,861,280 boxes.

# Lumbering Industry of Nova Scotia

## Its Chief Resources and Important Markets—England Likely to be the Chief Export Market in Future

Written specially for the Canada Lumberman By O. T. Daniels, Attorney General for Nova Scotia

Hon. O. T. Daniels, Attorney General for Nova Scotia.

The value of the forests of Nova Scotia as a factor in the industrial life of the province may be determined by figures recently published by the Department of the Interior, from which we learn that during the year 1913, the last year for which approximately accurate returns are available, the quantity of lumber cut within this province represented a total of 274,722,000 superficial feet with a market value of $3,669,264.

In comparison with 1912 we find the above quantity about thirteen per cent. less than the cut of 1912, and if figures for 1914 were available we would doubtless find the cut for 1913 considerably exceeded the quantity harvested in 1914.

Various causes may be assigned for the apparently diminishing quantity produced in recent years, chief of which may be noted the suspension of lumbering operations at various points within the province by some of our larger operators.

The principal wood shipped from Nova Scotia to the United States is hemlock, although there is also a considerable quantity of spruce and pine shipped. Most of the hemlock is shipped to New York and vicinity. Nova Scotia hemlock has to compete there with American lumber which comes chiefly from Pennsylvania, New Hampshire and New York States. Our spruce is chiefly shipped to the British market. At the present time there is no difficulty in securing a market for any and all Nova Scotia lumber. The great obstacle is scarcity of tonnage. Freights are extremely high and shippers are confronted with an unusual situation. Despite the rates, however, which range at 135 shillings per standard, substantial profits are being made.

### Future of the Export Trade

The Eastern Provinces of Canada have had practically a monopoly of the American Atlantic markets, but there can be no question of doubt that the link of the two great oceans by the Panama Canal will eventually establish a new order of things. Consequently the Nova Scotia lumberman must continue to regard England as his chief customer. Present lumber conditions are, of course, abnormal in the Motherland. Nevertheless, these conditions have given our lumbermen an opportunity never before enjoyed. On a resumption of normal trading it may well be that Nova Scotia will continue to fill requirements heretofore met by dealers in Russia and the Scandinavian countries.

With the increasing local consumption of all classes of lumber due to the steady development which is taking place, and the multiplication of pulp mills in Canada, coupled with the fact that the price of pulp wood has nearly doubled within ten years, the wood lands of this province have taken on a new value. As in most of the other provinces of the Confederation, the Crown lands of Nova Scotia at the time of the Union (due to a policy it is not my present purpose to discuss) had little of real value from the lumbermen's standpoint. Like all other countries, the forests were regarded by the early settlers as an enemy, and any means that would most quickly clear the land was resorted to. Such a sentiment naturally led to a succession of fires which annually, for many years, burned over large areas. An awakened sentiment as to the value and possibilities of that part of our forest lands still owned by the Government resulted in the passage of advanced legislation from time to time. These Acts were amended and consolidated in 1913 by the Forest Protection Act. This measure enlisted the sympathy and support of all classes, and its enforcement was made easy by its popularity.

### Preserving the Timber Resources

The result of this legislation has been that since 1904 we have not had any serious fires in this province and have demonstrated the popularity of controlling forest fires even under most difficult conditions. It is estimated that we have in forest area within this province about 5,000,000 acres that are not suitable for settlement, but are exceptionally qualified as a continuous forest area. With an annual growth of 100 feet per acre, a conservative estimate for our climate and location, this present forest area would produce an annual growth of 500,000,000 feet. Besides what is termed the forest area above referred to,

there are large tracts of lands previously regarded as waste, due to frequent burnings, that are now coming into forest bearing, and it is entirely possible with proper care that our regular forest area may nearly be doubled if only the forest fires can be entirely eliminated or controlled.

Such an addition to the wealth of the province would justify large expenditures and they might safely be made with the expectation that the experience of many of the European countries, which have developed their State Forests under an advanced system of forestry and are today reaping a large income from their holdings, which income is annually increasing, might be duplicated in this province.

To enumerate the value of forests in relation to agriculture and to mechanical industry and as conserving the stream flow of brooks and rivers is not my purpose, but I wish to reiterate this principle of nature—no forests, no waterways. The treeless and waterless districts of Europe furnish the proof.

The Hon. O. T. Daniels, Attorney General of Nova Scotia, whose portrait appears herewith, is a native of that province, having been born at Lawrencetown, Annapolis County, in 1860. He was educated in the public schools and at Acadia College, Wolfville. He was elected to represent Annapolis County in the Legislature Assembly in 1906 and re-elected in two subsequent provincial elections. In 1907 he was appointed a member of the Executive Council of Nova Scotia without portfolio, and in 1911 succeeded the Honourable A. K. McLean as Attorney General.

## Cargo Specification

As there does not seem to be any fixed rule for making up specifications in a uniform manner, reference to the subject will not be out of place. Some mills adopt the system of making all domestic and foreign export specifications out in feet board measure for each size and length, while others make out their specifications in lineal feet for each length and then add up their total and bring same to board measure. The latter system of making out the extensions in lineal feet should be universally adopted, as everyone who is familiar with this class of work knows that a specification with the extensions in lineal feet, and showing the totals in board measure, can be finished in a quarter the time of a specification that shows the feet board measure for each length.

Foreign buyers, especially in the British trade, use the lineal measure more extensively than any other, and when they receive specifications in feet board measure they are put to the unnecessary inconvenience of converting them to lineal feet to correspond with their tables and price lists.

### Short Method of Figuring Specifications

A very easy and short method of obtaining the board measure contents of each size and length, when required, is to halve the length and double the thickness. Simple as this rule seems, it is unknown to many experts.

Example: Find the board measure contents of the following:

| Pieces | Size | Length | Feet B. M. |
|---|---|---|---|
| 53 | 2 x 10 | 12 | 1060 |

In the above example, instead of saying twelve times fifty-three, halve the length and say six times fifty-three is three hundred and eighteen (318); now by doubling the thickness, we have the equal of 4 x 10 instead of 2 x 10; therefore, by adding a cipher to the 318 and dividing by 3, we have the board measure contents.

## To Figure Capacity of Freight Cars

Lumber:—To find the amount of rough green lumber any car will carry, cut off a cipher from the marked capacity in pounds, add 10 per cent. and multiply by 3; the result will be the limit of feet board measure the car is allowed to carry.

Example: What is the limit in feet board measure allowed a car of 80,000 pounds capacity?

8000 pounds.
800 10 per cent.

8800 x 3 equals 26,400 ft. board measure.—Answer.

Shingles:—To find approximate number of 16-inch shingles that can be loaded in a box car; ascertain cubical capacity of the car, and to the number of cubic feet add two ciphers; the result will be the number of shingles.

Mr. F. N. McCrea, M.P., has been again chosen as Liberal candidate for Sherbrooke County, P.Q. Mr. McCrea is extensively interested in lumber enterprises in the Eastern Townships district, and is a director of a large number of companies.

During the year 1914 Germany imported timber to the value of $95,778,578, of which Canada's share was $18,326. Germany's exports of timber were valued at $7,361,340, of which timber to the value of $19,516 was sent to Canada.

# Nova Scotia's Export Opportunities

### An Outline of the Foreign Trade in Forest Products and the Possibility of Increasing its Importance

In an address recently delivered before the Commercial Club of Halifax, N.S., Hon. R. M. MacGregor, of D. J. & P. A. MacGregor, Limited, New Glasgow, N.S., gave an interesting summary of the importance of the lumber industry to the province of Nova Scotia. Some of Hon. Mr. MacGregor's references to features of the industry, which are of interest from an export point of view, were as follows:—

While Nova Scotia is not a lumbering province in the same sense as British Columbia, Ontario, Quebec or New Brunswick, yet few of our own people have any idea of the magnitude of the industry even in this province.

When the first settlers came to our shores they found practically an unbroken forest right to the water's edge. This forest abounded with woods of great variety and value. Of these the pine and the oak were probably the most valuable. There were no sawmills in those early days, and the settlers set to work to hew the timber, as an immediate source of revenue and with the ultimate object of clearing the land for cultivation. For instance, we find that the famous band of Scottish pioneers, who came to Pictou in the ship "Hector" in the year 1773, a year later had hewn sufficient timber to ship a cargo to Britain. This trade rapidly developed all over the province. The prices received in those early days for hewn timber were remarkably high; birch bringing often as high as twenty shillings per ton of forty cubic feet. This is practically as much as it brings today, and having regard to the purchasing power of money in those early days, the price at that time was remarkable. During a period of about twenty years at the beginning of the nineteenth century, the timber trade in Nova Scotia flourished. It is curious and interesting how history is wont to repeat itself. The famous Berlin Decree of Napoleon Bonaparte, which closed the Baltic and the Scandinavian ports to trade with Great Britain one hundred years ago, had precisely the same effect upon the timber trade of Nova Scotia as the present great war is having upon it today. The prices of all kinds of lumber soared high and Nova Scotians profited directly as a result of the Napoleonic War.

We are wont to point back with feelings of pride to the great days of our wooden shipbuilding industry, when Nova Scotia boasted a fleet of merchantmen sailing the seven seas, and when our per capita tonnage of sea-going vessels was the greatest of any country in the world. It is interesting to remember, however, that the development of this shipbuilding industry was a direct outcome of the timber trade. I have noted how the early settlers soon began to export timber to Great Britain. It was not long until they commenced to build the vessels to carry this timber. It is true that these ships were at first crudely constructed and were generally sold with the cargo upon making a single trip across the Atlantic in the summer weather. It is none the less true, however, that it was these humble beginnings of shipbuilding that ultimately resulted in the great Nova Scotia fleets of thirty and forty years ago.

Spruce from the central and eastern portions of the province goes almost wholly to Great Britain; so also does hardwood in the form of deals, with a small quantity of hewn birch. In the western portion of Nova Scotia, however, the spruce and the pine are sent largely to South America, the West Indies and the United States. The reasons why this is the case are partly geographical and partly owing to custom.

### Importance of Nova Scotia Export Trade

The importance of the export trade to the various ports of the province is very considerable. From the port of Halifax, there was shipped last year over sixty million feet of lumber. The stevedoring of this alone would amount to a very considerable item, to say nothing of the money left in the port by the many vessels required to move this stock. The same is true to a lesser extent of Pugwash, Pictou, Bridgewater, Annapolis, Parrsboro' and the other points of export.

Dr. Fernow estimates the annual lumber production of the province at from three hundred and fifty million to four hundred million superficial feet. With the increased activity this year, owing to war prices, I would think the production for 1915 would not fall short of five hundred million superficial feet, representing a cash value of from $7,000,000 to $8,000,000. Dr. Fernow's estimate of the proportions of value of output is as follows:—

| | |
|---|---|
| Spruce | 62 per cent. |
| Hemlock | 20 per cent. |
| Pine | 10 per cent. |
| Hardwood | 4.5 per cent. |

Of the output, he considers that fully eighty per cent. is exported. He estimates the standing coniferous timber of the province at ten billion feet. This would represent about twenty-five years' supply

at the present rate of consumption, without taking into regard the new growth.

In the estimates that I have given you, I have not dealt at all with the production of pulp wood, or the making of mechanical pulp. As we have very few water powers in Nova Scotia capable of great development, our manufacture of pulp has been thus far on a limited scale. This industry is confined to the southern and western part of the province, where there are manufactured at some half dozen pulp mills about 50,000 wet tons of pulp per year. This has a value of about $400,000, and represents about twenty-five thousand cords of wood. But although there is no pulp industry in the eastern part of Nova Scotia, there is a continuously increasing demand for pit timber for our collieries. This consumes a large quantity of wood of a similar nature to that required for pulp in the western part of Nova Scotia. From the annual report of the Department of Mines, I find that for pit props, etc., there were used by the collieries of Nova Scotia last year about twenty million lineal feet, or probably forty thousand cords. At the present time an investigation is being undertaken jointly by the Conservation Commission and McGill University respecting the supply of pit wood available for our colleries, and the nature and possibilities of the various woods used for this purpose. Principal Sexton has already conducted some most interesting experiments in our own Technical College as to the relative strengths of the various pit woods. Personally I do not think that there is any possibility of a shortage of pit timber for many, many years to come. The prices paid by the collieries have always been extremely low, being sufficient merely to pay for the labor of cutting the wood, without allowing anything for the wood itself. Even with these low prices, it has always been found possible to obtain an ample supply of pit wood, and in my judgment there is no need for any anxiety for the future in this respect.

Supplementing the remarks quoted above, Hon. R. M. MacGregor, in a letter to the Canada Lumberman, says:—The spruce deals, hardwood planks and hewn timber (birch) exported from Nova Scotia are practically all shipped to Great Britain. Inch boards, both in pine and spruce, go to South America and the West Indies. A large quantity of hemlock is shipped to the United States, the greater part of it in 2-in. scantling, cut to sizes. Practically all the wood cut in the central and eastern parts of Nova Scotia goes to Great Britain, and in a large measure what is cut in the western part of the province goes to South America, the West Indies and the United States. The United States takes a considerable quantity of 2-in. spruce scantling, as well as the 2-in. hemlock. Very little has ever been done in Nova Scotia in the manufacture and export of spool wood, though a large quantity of this is always shipped from the State of Maine.

There would also seem to be a good export market for cheap furniture. One or two concerns, working in a small way and at great natural disadvantages in respect to their supply of hardwood, have made quite a success at this trade, and there would seem to be great possibilities in it. The same thing applies to the working up of our red birch and our maple, into flooring and finishing, for which there is an almost unlimited market in the United States. Since the war began, there have been numerous inquiries for pit props to Great Britain. It is probable that quite a large trade would have been done in these this winter had not such exceptionally high ocean freights prevailed. From Great Britain also, inquiries ar now coming for hemlock sleepers. There may be great possibilities in this direction.

In speaking before the Commercial Club, I may have left the impression that no use whatever was made of the slabs at our sawmills. I should have pointed out that a great quantity of laths were cut, most of which are exported to the United States. The difficulty, of course, remains that where a portable mill is sawing at any distance in the woods, it seldom pays to cut laths, and the slabs are all wasted.

## A New Montreal Export Firm

The Camwick Lumber Company, Limited, has been formed, with offices at 809 Drummond Building, Montreal, mainly for the purpose of doing an export business. Mr. Irving G. Ludwick is the president, Mr. D. R. Cameron, vice-president and general manager, and Mr. A. M. MacGregor, secertary-treasurer. Mr. Ludwick made his first visit to Canada 19 years ago, and has crossed the Atlantic twenty times. He has also travelled extensively in Australia, the United States, and other countries. He had intended to return to England by the Lusitania, but fortunately was detained in Canada. Mr. Ludwick informs us that he has been engaged on a tour of inspection of the different lumber sections of Canada and Newfoundland. During February and March he drove for six weeks through the timber areas of Nova Scotia. He also traversed on foot, attended by a native cruiser, many frozen lakes and rivers, thus obtainng first hand information regarding what he considers the finest soft wood belt in the Dominion, if not on the whole of the North American continent, the transportation and accessible shipping facilites for export trade to the British Isles and foreign markets being unexcelled.

# Canadian Commisssion Firms Need

### South African Trade Too Often Handled by U. S. Firms—Dependable Inspection Would Build Large Business

In connection with the trade in Canadian lumber in South Africa one of the most important points to consider is the manner in which the transaction is handled at the Canadian end and the manner in which the shipment is made. As on the Pacific Coast, it appears that on the Atlantic Coast also Canadians have been greatly handicapped in the export trade by the lack of commission houses to handle their stocks. Canadian stocks from British Columbia to Australia are handled very largely by San Francisco brokers and on the Atlantic Coast, New York Commission houses handle a large amount of the stock exported to South Africa. This is a great drawback to the Canadian manufacturers and one which ought to be removed at the earliest opportunity. This point is well brought out in letters received by a prominent Canadian wholesaler from the Canadian Trade Commissioner at Capetown, South Africa. In one of these letters the Trade Commissioner, referring to visits which he had paid to a number of South African lumber firms, reported that " all had expressed a desire to arrange purchases of Canadian lumber direct from Canadian dealers and through Canadian ports instead of through New York commission houses. Many of these people, " the Commissioner says, "have made efforts in the past for direct trading, but the obstacle to overcome is standard of grade. Their experience has been that a lumber dealer in one section of Canada would ship as number one, an article which another dealer would ship as number three, and very often the shipper of grade number three would, on the next shipment, send as number two or number one a board that was no better than his previous number three; whereas with an indent for Canadian lumber through New York commission houses, although more expensive, results were more satisfactory, as the New York commission houses invariably inspect all lumber that is shipped for export to South Africa, so, **if you are prepared and will establish a reputation for a fair standard grade, there is no limit to the business that you can do in twelve-inch boards at the right price.**

### A Handicap to Canadian Business

Of course, you will appreciate that the placing of orders for Canadian lumber to South Africa through American channels is a big handicap, as, very often the American commission houses will claim that they have not been able to fill indents for Canadian lumber and they ship American, or very often Canadian at a higher price, through American channels, and my object now is to overcome the New York commission business. This can be done if Canadian lumber dealers, anxious for export, will prove to the trade here that they can be depended on for standard grading.

In further reference to twelve-inch planks, I may say that while on my trip, knowing, of course, that twelve-inch was in comparison more expensive than eight inch, I tried to create a demand among these different people for a narrower board, but it seems to be an almost hopeless task, as the twelve-inch is the only one they use.

You will find also on any correspondence or orders that may come to you, that for coast consumption, they will order dressed lumber; however, for up-country, the orders will be placed for the rough board, as the railway rate of freight on rough lumber from the coast to inland towns is about half the price that it is on the dressed.

I have interviewed a couple of the people here who state that your price sounds very reasonable provided that they get a good grade of board, and there is no doubt that trade can be done in large quantities if suggestions as made are carried out.

In reply to this letter the Canadian wholesaler said that in some cases South African importers asked for delivery at St. John, N. B., and that the freight from an inland point in Ontario to St. John was too high to warrant making shipment. The Canadian Trade Commissioner at Capetown thereupon suggested that quotations might be made on shipments to Montreal instead of St. John. Continuing the Trade Commissioner said, "one of the big difficulties I have to overcome is this indenting of Canadian orders through New York houses, and it can only be overcome by establishing in Canada some export commission houses on the same lines as the Americans have established in New York and Boston. This will have to come in time, and I hope in the near future. Canada's general exports are growing to such an extent that we should be able to interest some of our financial people in establishing a house of this kind. Then, instead of being shipped for inspection in New York, it can be done under many conditions at home, say such as inspection in any one yard to which you may be prepared to ship from, or to the port where you would deliver your goods for the steamer.

---

James Grafton, president of the Foreign Lumber Company, Huntington, West Va., a former resident of Aldborough Twp., Ont., paid a visit recently to West Lorne, Ont.

All the Pacific Coast lumber imported into Glasgow is sold as "Oregon." For this reason British Columbia does not obtain the credit due for its shipments to Glasgow. Glasgow merchants however, are desirous of giving a preference to British Columbia lumber so far as market conditions will permit. The following statistics of import are interesting:—

### Oregon Pine, Logs and Planks

| Year | Imported to Clyde. |
|---|---|
| 1911 | 253,850 cubic feet |
| 1912 | 571,050 cubic feet |
| 1913 | 360,000 cubic feet |

The undernoted are the recognized sizes used at Glasgow:—2½ x 5 full, 3 x 5 full, 20 foot and up long—average 26 to 27.

Clear lumber free from sap and all other defects. These are used largely for ships decks.

Three-inch to 6-inch and up, length 12 feet used principally by saw mills.

During the year 1913 the imports of timber into the United Kingdom were valued at $164,439,235, Canada's share of which was $18,442,124. Other important sources were as follows:—Russia, $66,866,765; United States, $25,086,946; Sweden, $22,372,431.

## Canadian Exports of Forest Products for Year Ending March 31st, 1914, Showing Destinations.

The box shook trade of Great Britain is of large dimensions and holds out promising opportunities for Canadian manufacturers. Conditions have greatly altered during the war, in favor of Canadian trade, and it is probable that proper attention to the requirements of the market will result in a greatly increased volume of trade in this line after the conclusion of the war. Previous to the war Canadian manufacturers were securing a small amount of this trade. While quotations received from Canada upon large specifications were slightly higher than the prices made by certain Baltic firms, the difference was much less than it had formerly been. Had it not been that Baltic mills, on account of scarcity of orders were willing to make special reductions in their prices, so as to keep their mills going, a large proportion of the orders would have come to Canada. Canadians have necessarily to pay higher rates for transportation than their Baltic competitors, but the difference in favor of the Baltic is considerably reduced in connection with shipments to the West Coast of Great Britain. English firms of importers of box shooks believe that, with a favorable location and concentration upon export trade, Canadian sawmills could secure a large portion of the trade.

## An Analysis of its Sources of Supply for Wood Goods—Canada's Share in the Trade

In the Canada Lumberman of February 1st we published an extensive discussion of the lumber markets of Great Britain and the course of trade therein during the past year. In order to publish a complete discussion of these markets in the present issue we would have to repeat the greater part of the reports in the previous issue. For this reason we ask our readers to turn up the issue of February 1st to supplement the information which appears in the present issue.

A great deal of information regarding the markets of Great Britain will also be found in special articles appearing elsewhere in this issue referring to the trade of the Maritime Provinces, and also in an article upon the general export trade, written by Mr. A. E. Trotman.

The course of the lumber trade of Great Britain, from an importing point of view, and in fact the whole situation in condensed form is very definitely set forth in the following table:—

Nearly the whole of the deficiency in the year 1914 as compared with 1913 may be accounted for by the diminished shipments from Russia, the shortage amounting to about 500,000 standards.

All imports of wood and timber into the United Kingdom are free of duty.

### Great Britain's Import Figures

No business in the United Kingdom was more definitely and directly affected by the war than the timber trade. Many sources of import were greatly interfered with and enquiry was immediately turned to Canada as an alternative source of supply, notably for railway sleepers, telegraph poles, pitwood, and structural lumber.

The imports of wood into the United Kingdom for 1914 and preceding years were as follows:—

| Kinds of wood and countries. | Quantity. | | | Value. | | |
|---|---|---|---|---|---|---|
| | 1912 | 1913 | 1914 | 1912 | 1913 | 1914 |
| Hewn (fir, oak, teak, etc.), other than pit props or pit wood: | *Loads.* | *Loads.* | *Loads.* | | | |
| British East Indies | 34,973 | 37,092 | 28,653 | $3,011,482 | $3,406,905 | $2,658,984 |
| Canada | 53,109 | 39,656 | 37,025 | 2,297,036 | 1,513,432 | 1,492,278 |

While the reports for 1914 show a falling off as compared with 1913, the result is good when it is considered that 1913 imports constituted a record. Canadians have been especially interested in the diminished shipments from Russia the shortage amounting to about 500,000 standards, nearly 90 per cent. of the total decrease in Great Britain's imports. According to a report issued by Foy, Morgan & Company the imports into Great Britain during recent years have been divided according to their origin as follows:—

| | 1914 | 1912 | 1910 | 1908 | 1906 | 1904 |
|---|---|---|---|---|---|---|
| | p.c. | p.c. | p.c. | p.c. | p.c. | p.c. |
| Russian goods | 35 | 49 | 47 | 42 | 35 | 32 |
| Scandinavian goods | 33 | 27 | 26 | 29 | 33 | 33 |
| Canada and United States | 25 | 23 | 25 | 26 | 29 | 31 |

The average import cost per standard for timber shipped to Great Britain has been increasing year by year, particularly during the past three years. Figures since 1906 are as follows:—

| | £ | s. | d. |
|---|---|---|---|
| 1914 | 10 | 13 | 0 |
| 1913 | 10 | 9 | 3 |
| 1912 | 9 | 18 | 3 |
| 1911 | 9 | 9 | 0 |
| 1910 | 9 | 9 | 3 |
| 1909 | 9 | 0 | 3 |
| 1908 | 8 | 16 | 6 |
| 1907 | 9 | 11 | 0 |
| 1906 | 9 | 4 | 9 |

### Liverpool Prices of Imports

The staple soft wood markets at Liverpool have shown a phenomenally steady rise in values since last summer, occasioned more by freights than by consumption. The following table, furnished by Smith & Tyrer, Limited, gives an interesting recapitulation of the spruce market during the past ten years:—

| | Spruce Stock | | Spruce Consumption | | Price | | Freight | |
|---|---|---|---|---|---|---|---|---|
| | Highest | Lowest | Highest | Lowest | Highest | Lowest | Highest | Lowest |
| | Stds. | Stds. | Stds. | Stds. | £ s. d. | £ s. d. | | |
| 1914 | 25,270 | 11,950 | 10,930 | 4,470 | 14 10 0 | 8 10 0 | 80/- | 35/- |
| 1913 | 36,030 | 7,970 | 9,430 | 3,640 | 10 15 0 | 9 7 6 | 60/- | 40/- |
| 1912 | 27,320 | 8,210 | 11,400 | 4,500 | 10 15 0 | 8 7 6 | 70/- | 45/- |
| 1911 | 29,320 | 9,080 | 10,830 | 5,500 | 8 7 6 | 7 17 6 | 45/- | 32/- |
| 1910 | 31,520 | 11,840 | 11,750 | 5,000 | 8 7 6 | 8 0 0 | 37/6 | 30/- |
| 1909 | 25,360 | 11,600 | 14,460 | 4,500 | 8 2 6 | 7 12 6 | 37/6 | 30/- |
| 1908 | 31,640 | 9,700 | 11,250 | 5,100 | 7 15 0 | 7 7 6 | 37/6 | 27/6 |
| 1907 | 43,100 | 18,700 | 15,340 | 6,350 | 8 5 0 | 7 2 6 | 41/3 | 35/- |
| 1906 | 41,390 | 8,670 | 11,620 | 5,540 | 8 5 0 | 7 7 6 | .... | .... |
| 1905 | 29,290 | 11,000 | 12,600 | 5,000 | 8 5 0 | 6 10 0 | .... | .... |
| 1904 | 32,080 | 21,420 | 13,000 | 5,000 | 7 12 6 | 6 0 0 | .... | .... |
| Average for 11 years | 32,029 | 11,831 | 12,055 | 4,973 | 9 3 8 | 7 12 11 | .... | .... |

At the beginning of last year the market for New Brunswick and Nova Scotia spruce deals was depressed as stocks of Liverpool and neighboring ports were heavy. Parcels of the usual specification, about 50 to 60 per cent. of 3 x 7 and 8-in. were bringing about £9 5s. per standard c.i.f. The market weakened until the end of April when the lowest price of the year was reached, namely, £8 10s. per standard c.i.f. A slight improvement occurred until July when the freight market commenced to stiffen and spruce deals advanced until the end of the year when they reached £14 10s. and £15 per standard c.i.f.

### Canadian Stocks at The Clyde

The Clyde Timber Brokers' Association report that Canadian stocks at the various Clyde markets on March 31, 1915 and 1914, were as follows:—

| | Stock at March 31, 1914. | | Stock at March 31, 1915. | |
|---|---|---|---|---|
| | Pieces | Cubic Ft. | Pieces | Cubic Ft. |
| Quebec square yellow pine | 2,169 | 143,342 | 1,009 | 67,196 |

## Imports into Manchester Canal

Timber imports into all sections of the Manchester Canal for the twelve months ending December 31, 1914 and 1913, totalled 442,681 loads and 594,249 loads respectively. During 1914 the consumption exceeded the import by about 10,000 standards, but was 14,766 standards less than during 1913. Quebec pine deals, etc., imported reached 5,692 standards, and the consumption was 7,002 standards. The quantity received was about 1,000 standards less than during 1913, but the consumption showed an increase of about 700 standards. Stocks therefore were seriously depleted at the close of the year and amounted to only 974 standards. Spruce values at the beginning of 1914 were as follows:—

| | Per std. | | | | Per std. | | |
|---|---|---|---|---|---|---|---|
| 3 x 7 and 8 at | £10 | 7 | 6 | 4 x 9 at | £13 | 0 | 0 |
| 3 x 9 and 10 at | 11 | 10 | 0 | 4 x 11 at | 13 | 10 | 0 |
| 3 x 11 at | 12 | 5 | 0 | 3 x 6 at | 10 | 0 | 0 |
| 2½ x 7 at | 11 | 0 | 0 | 3 x 4 and 5 at | 9 | 15 | 0 |
| 4 x 7 at | 10 | 10 | 0 | | | | |

At the end of the year they had passed all previous records and stood as follows:—

| | Per std. | | | | Per std. | | |
|---|---|---|---|---|---|---|---|
| 3 x 7 at | £15 | 0 | 0 | 3 x 11 at | £17 | 0 | 0 |
| 3 x 9 at | 16 | 0 | 0 | 3 x 4 to 6 at | 14 | 10 | 0 |

Imports of Quebec board pine during 1914 amounted to 6,549 logs, as compared with 1,841 during 1913. Deliveries amounted to 4,203 logs, a decrease of over 1,500. The stock carried over amounted to 5,885 logs, which it was expected would be seriously depleted very shortly. The quantity of birch logs imported was 5,215, and the consumption was 4,489, which showed increases of 1,509 and 485 logs respectively. The stock on hand at the beginning of the year was about 1,500 logs. Birch planks were imported to the amount of 1,425 standards, as compared with 903 standards during 1913. The deliveries were 1,366 standards as compared with 870 standards during 1913. At the close of the year the stock amounted to 631 standards.

Spruce imports during 1914 amounted to 41,097 standards, or 15,661 standards less than during 1913, and 7,569 standards less than during 1912. The consumption during the year amounted to 51,506 standards as compared with 46,536 standards during 1913. The increased demand is to a great extent the result of the shortage in shipments of white wood from Riga and Petrograd.

Imports of Quebec square elm logs have steadily increased during recent years. Last year's import was 1,379 logs and the consumption was 1,277 logs as compared with 1,182 and 1,031 logs respectively during 1913.

## London's Imports of Wood Goods

London's imports of sawn wood, or deals, battens, boards and ends in pieces, from Canada during the past three years were as follows:—1914, 2,738,000; 1913, 3,339,000; 1912, 2,797,000. The imports of timber, spars, sleepers, etc., in loads were as follows:—1914, 1,430; 1913, 5,400; 1912, 2,820.

The following table is a summary of the wood imported into London from Canada during the last four years:—

| | 1911. Pieces. | 1912. Pieces. | 1913. Pieces. | 1914. Pieces. |
|---|---|---|---|---|
| Pine Deals, etc., from the St. Lawrence | 400,000 | 590,000 | 508,000 | 249,000 |
| Spruce Deals, etc., from the St. Lawrence | 970,000 | 804,000 | 1,155,000 | 1,084,000 |
| Birch Deals, etc., from the St. Lawrence | 320,000 | 342,000 | 303,000 | 185,000 |
| Spruce Deals, etc., from New Brunswick, etc. | 436,000 | 490,000 | 468,000 | 835,000 |
| Birch Deals, etc., from New Brunswick, etc. | 249,000 | 400,000 | 373,000 | 385,000 |
| | Timber 1911. Loads. | 1912. Loads. | 1913. Loads. | 1914. Loads. |
| Yellow Pine from Quebec | ..... | ..... | 420 | ..... |
| Red Pine from Quebec | 27 | 154 | 15 | ..... |
| Elm from Quebec | 1,718 | 1,059 | 2,952 | 601 |
| Ash from Quebec | 16 | 69 | 52 | ..... |
| Oak from Quebec | 108 | 34 | 210 | ..... |
| Birch from Quebec | 1,619 | 1,246 | 1,761 | 806 |
| Birch Nova Scotian, etc. | 138 | 225 | ..... | 30 |

## British Government's Demand for Wood Goods

Although the business of last year was unequal, the dullness of the first half being succeeded by a sequence of interruptions and dislocations, surprises and uncertainties, unexampled in the previous experience of the trade, authorities consider that 1914 was a most favourable year for importers, because in spite of anxieties and disorganization, the steady upward movement of prices since the end of August has enabled them to secure a scale of profit which has rarely, if ever, been surpassed.

The main factor in the creation of this situation has been the phenomenal demand by the Government for timber of many kinds for purposes connected with the campaign, which has caused values of all kinds to rise to a level which in ordinary times would be regarded as hazardous.

The year 1914 ended with no relaxation in the demand, and as practically no contracts had been concluded concerning shipments from Scandinavia and Russia for 1915, the trade and future outlook were almost wholly controlled by the duration of the war.

## A Large Trade Possible in Creosoted Blocks

Great Britain imports annually many millions of wood blocks for street paving, chiefly from Australia. Municipalities invite tenders periodically and Canadian firms interested should communicate with the surveyors of the larger cities and towns. The blocks are cut in various sizes from hardwoods susceptible to creosote. Canadian manufacturers intending to seek this trade will probably have to make arrangements with creosoting works at English ports to despatch the blocks to their destination after creosoting. If the timber submitted and the prices are satisfactory, sales in Great Britain are large enough to warrant the appointment of a resident agent. Information will be furnished by the Canadian Trade Commissioner at Birmingham, Mr. J. E. Ray, concerning cost of creosoting and inland freight charges.

The following are details of a specification issued by one municipality, which may be taken as an average sample of most of the specifications:—Unless otherwise arranged the blocks are to measure exactly 3 in. wide, 6 in. to 9 in. long and 5 in. deep, and to be cut perfectly die square and true to these dimensions. All the blocks are to be of the very best quality of red wood, fine grain, fair weight, with no waney edges, free from sap, large or dead knots, shakes and all other defects, and thoroughly well seasoned. Before the order is given, the contractor shall submit a fair sample, say six or more blocks of each kind required, uncreosoted. If these are approved by the borough surveyor, the sample shall be taken to represent the bulk of the blocks intended to be supplied and shall be strictly adhered to.

The best redwood blocks shall be creosoted in either of the following manners:—

(1) The timber to be thoroughly well dried and seasoned, and placed in the creosoting tank and subjected to a vacuum of 3 to 5 pounds per square inch for half an hour. The creosote oil at a temperature of not less than 100 degrees Fahr. is then to be forced into the tank at a pressure of not less than 150 pounds per square inch, until the timber has absorbed 1 gallon of creosote oil per cube foot, and is thoroughly saturated with oil to the heart of the block; or

(2) The timber as above to be thoroughly well dried and seasoned and placed in large tanks of creosote oil heated to a temperature of not less than 100 degrees Fahr. for a period of not less than eight hours, until the timber has become thoroughly saturated with oil to the heart of the block.

The whole of the blocks before being creosoted shall be inspected in bulk and approved by the borough surveyor or his inspector.

The Canadian High Commissioner, 17 Victoria Street, London, S.W., recently forwarded to the Department of Trade and Commerce, Ottawa, a report to the effect that the Westminster city engineer and surveyor had made enquiry regarding the supply of timber from Canada for street paving. The city of Westminster uses about two or three million blocks every year and there are also 28 Metropolitan districts that are large users. The specifications provide roughly for blocks to be creosoted 10 lbs. to the cubic foot; no block to contain more than 10 per cent. of sap wood; to be die square; no waney edges and no large loose or unsound knots. The deals are to be dead true in thickness. Prices which were being asked in January last were £12 per 1,000 for 9 in. x 3 in. x 5 in. blocks, creosote 10 lbs. to the cubic foot, and delivered in London. Nine months ago the normal price for these blocks was £9 10s. per 1,000. Contracts now being entered into call for six months supplies and for deliveries of a definite amount during the six months. This is an important trade and several city engineers in Great Britain have expressed the opinion that it will repay Canadians to establish an agency in the United Kingdom so that a permanent business may be built up.

## United States Report on Wood Block Export Trade

Crosoted wood block when properly treated and laid will fill all requirements expected of the best paving material, when final cost and comfort are considered. It is noiseless and smooth. It does not crumble away like other pavements, but under heavy traffic compresses and becomes more compact. It is the easiest kind of road upon which to draw a load. It is not slippery, and as it is laid with the end grain up it cannot splinter. Being impregnated with creosote it is highly antiseptic and sanitary and is easily cleaned on account of its smooth surface. When repairs are necessary, or if it is taken up to lay conduits, sewers, etc., the blocks can easily be removed and a large percentage of the material replaced.

Wood block make an ideal pavement for automobiles. There are so many reasons for favoring creosoted wood block pavement that its use is certain to be far greater in the future than it has been in the past. The heaviest block manufactured, 4 in. deep, such as is used for the most severe traffic, weighs only 188 lbs. to the square yard, as against 400 lbs. for brick and 900 lbs. to 1,000 lbs. for granite block, possessing less durability. This is a fact of special interest in connection with the selection of material for bridge floors. By laying a thoroughly treated plank floor with wood block placed directly thereon, an enormous saving can be realized in the construction of bridges.

This form of construction is being adopted on some of the most important and expensive bridges in the Eastern States.

Wood blocks when used for bridge and road pavements, factory, warehouse or stable floors are laid with the grain showing the natural rings up to the surface. In size they are usually as follows:—depth parallel to the fibre, 3 in., 3½ in. or 4 in.; width not less than 3 in. or more than 4 in.; length not less than 6 in. or more than 10 in. Blocks should be all of sound timber free from bark, wane, shakes, loose or rotten knots or other defects, detrimental to the life of the block. In depth and width they should not vary more than one-eighth of an inch from dimensions specified in the contract. A small proportion of bright sap should be allowed because when creosoted the sap wood has been shown to be as strong as the heart wood. A still more suitable grade could be obtained by excluding blocks of exceptionally coarse grain.

In Europe natural seasoning is used almost entirely with excellent results, but in the United States steam and vacuum pumps are used to remove the moisture from the sap and heart wood. The creosoting oil is forced into the blocks under pressure of from 125 to 150 lbs. per square inch, varying from 12 to 20 lbs. per cubic foot (the whole treatment taking from 8 to 10 hours). The blocks are then removed and after drying, are ready for use.

Definite efforts should be made by Canadian lumbermen to promote the use of creosoted blocks for pavement purposes in the chief export markets in which they are interested. There is no question but that such a course will bring good results, probably in a shorter time than any other line of export effort.

## Miscellaneous Opportunities for Trade in Great Britain

**Small Woodware:**—The British market for small woodware covers a lengthy list of articles, many of which are interesting to Canadian woodworkers. Among the articles required are the following: Wheelbarrows, cheap cricket bats and croquet sets, skipping rope handles, bowls, tool boxes, pencil cases, rulers, writing and other cabinets, pipe racks, wooden brackets of all kinds, fretwork of all kinds, clock cases, wooden clogs and sabots, walking sticks, billiard cues, golf sticks, fancy boxes and small cabinet ware, writing desks, slates and school fittings, draughts and chess sets, ninepins, brush backs and ware, clothes pegs, wooden handles and knobs of all kinds, spokes, hammer and pick handles, gun stocks, boot lasts, brooms and brushes, broom handles, cornice poles and rings, wooden platters, spoons and butter prints, wooden hoops, spades, wickets, table and chair legs, balusters, bungs and spile pegs, wood wool, wooden pipe lighters, veneers, tree-nails, railway kegs, dowel pegs, wooden boot heels, mangle rollers, saddle trees, hubs, felloes, and cart and carriage ware, prepared woodwork for casks, bentwood furniture, parquet flooring, blind and builders' laths, electric light casements and fittings, wickerwork, chip boxes, jewel cases, tea chests, writing desks, pen holders, wood screws, phohographic cameras and stands, serviette rings, paint brushes and handles, large quantities of cheap picture frames and mouldings.

**Veneer Wood:**—The Department of Trade and Commerce at Ottawa, have recently secured and placed on file names of firms in Glasgow who are in the market for veneer wood. These firms are desirous of knowing what Canadians can offer. One firm writing to the Department says, "We stock 3-ply wood in thicknesses 4 to 9 m/m, various sizes. Our chief requirements consist of birch, both in veneer and log timber, and any information you can give us respecting supplies will be greatly esteemed. The stock must be 3 equal ply, 4½/4¾ m/m thick, cemented together with waterproof cement (not glue), and the principal sizes required are about 24 in. x 18½ in. and 18½ in. x 18½ in. We shall be glad to hear from you if this material can be brought over from Canada, and the probable price."

**Butter Cask Staves:**—A firm of produce dealers of London, England, recently reported to the Canadian Trade Commissioner that they wished to secure supplies of staves for butter casks, sufficient for 10,000 casks per month. The stock is for a large butter producing and shipping organization in Siberia. Beechwood is usually employed for making these casks, but other kinds of wood may be used if without smell and taste. Douglas fir, to be suitable, the Trade Commissioner reports, would probably require deodorizing. The approximate measurements and other specifications of the staves required are as follows:—

Length, 1 foot 11 inches.

Width, from 2 inches to 3½ inches in centre, tapering off to ½ inch less at ends.

Thickness, ¼ inch.

One-sixteenth inch groove, ¾ inch from each end.

One end to be tapered from groove to end down to ½ inch thick.

The wood to be planed smooth.

Lids of casks, 14 inches diameter.

Quotations would probably have to be made f.o.b. steamer, Canadian ports. The firm making the above enquiry wish to receive quotations from Canadian shoppers for staves, both of beech and Douglas fir. The name and address of the firm may be had from the Department of Trade and Commerce, Ottawa, if readers will ask for information regarding trade enquiry 579.

**Mouldings:**—Consumers of mouldings, comprising composite, polished and natural woods, bronze, gilt, gilt slips and picture mouldings in Great Britain have several times advised the Canadian Trade Commissioner at Glasgow that there is an opening for such goods from Canada. Importers are desirous of receiving Canadian samples. Quotations should be made in a very definite manner so that importers may arrive at an estimate of what the goods will cost laid down in Great Britain. The usual manner of quotations seems to be 100 feet in 9-foot lengths. Careful packing is of great importance. Italian manufacturers are already looking after the Glasgow market in composite goods. Canadians, however, would be given every opportunity for competing. Imports of mouldings into Great Britain during recent years were valued as follows:—

| Country whence consigned. | Value. 1909. £ | 1910. £ | 1911. £ | 1912. £ | 1913. £ |
|---|---|---|---|---|---|
| Norway | 3,573 | 5,547 | 4,908 | 2,273 | 4,316 |
| Germany | 157,285 | 149,466 | 155,678 | 147,630 | 171,569 |
| Netherlands | 14,883 | 11,612 | 17,112 | 16,881 | 21,765 |
| Belgium | 4,818 | 5,953 | 7,415 | 4,833 | 3,950 |
| United States of America. | 10,207 | 11,096 | 8,583 | 7,528 | 7,922 |
| Other Foreign Countries. | 1,874 | 1,611 | 3,879 | 4,718 | 10,896 |
| Total from Foreign Countries | 193,640 | 185,285 | 197,575 | 184,363 | 220,418 |
| Total from British Possessions | 169 | 18 | 58 | ..... | |
| Total | 193,809 | 185,303 | 197,633 | 174,363 | 220,418 |

**Broom handles:**—A number of enquiries have recently been received by the Canadian Trade Commissioner at London, England, regarding supplies of broom handles from Canada. A leading London firm states that the following were current quotations in April of the present year:—

| | | |
|---|---|---|
| 1st quality | 50 in. x 1 in. at 17s. | per gross. |
| 2nd quality | 50 in. x 1 in. at 14s. | per gross. |
| 1st quality | 50 in. x 1⅛ in. at 22s. | per gross. |
| 2nd quality | 50 in. x 1⅛ in. at 18s. 6d. | per gross. |
| 1st quality | 50 in. x 1¼ in. at 30s. | per gross. |
| 2nd quality | 50 in. x 1¼ in. at 25s. | per gross. |

They state that these values are abnormal and are about double those of a year ago.

## Useful Knowledge for Exporters—Standards

One of the most essential factors in successful export lumber trading is an intimate knowledge of methods of measurement, and familiarity with the conversion of one country's measure into that of another. For the following material we are indebted to Mr. Bernard Brereton's interesting book entitled "The Practical Lumberman," a third edition of which has just been issued.

### Standards of Various Countries

The "St. Petersburg Standard" is used in Great Britain, almost to the entire exclusion of all other standards.

The wholesale trade as a rule sells boards, battens, deals, planks, etc., by the Standard.

### Composition of Standards

| | Pcs. | Size. Inches | Leugth Feet | Contents B. M. | Cu. Ft. |
|---|---|---|---|---|---|
| St. Petersburg | 120 | 3 x 11 | 6 | 1980 | 165 |
| Irish or London | 120 | 3 x 9 | 12 | 3240 | 270 |
| Christiania | 120 | 1¼ x 9 | 11 | 1237½ | 103⅛ |
| Drammen | 120 | 2½ x 6½ | 9 | 1462½ | 121⅞ |
| Quebec | 100 | 2½ x 11 | 12 | 2750 | 229 |

The Drontheim Standard varies for different kinds of lumber. It contains:

2376 feet B. M. of Sawn Deals.
2160 feet B. M. Square Timber.
1728 feet B. M. of Round Timber.

The Wyburg Standard contains:

2160 feet B. M. of Sawn Deals.
1963 2/3 feet B. M. of Square Timber.
1560 feet B. M. of Round Timber.
100 St. Petersburg Standard Deals equal 60 Quebec Deals.

The Riga "Last" contains 960 feet B. M. of Sawn Deals of Square Timber.

A load contains 600 ft. B. M.

One ton of timber contains 480 feet B. M.

A cubic fathom of lathwood is 6 ft. x 6 ft. x 6 ft. and contains 216 cubic feet or 2592 feet B. M.

A gross hundred (120 pieces) makes a standard hundred.

A Typical Nova Scotia Plant—Mill at Lake Jolly, N. S., Owned by Messrs. Clarke Bros. & W. E. Miller.

Large New Brunswick Operators—The Bathurst Lumber Company's Mill, Bathurst, N. B.

Shipping Scene at J. B. Snowball Company's Plant. Chatham, N. B.

Calumet, Que., Plant of the Riordon Pulp and Paper Company.

# Ontario's Export Lumber Trade

Written Specially for the Canada Lumberman by Hon. G. Howard Ferguson, Minister of Lands, Forest and Mines.

Hon. G. Howard Ferguson, in charge of Ontario Forests.

It is always interesting to know who your customers are for what you have to sell and where your markets lie. In this connection the Canada Lumberman has asked me to say a few words about Canada's export of forest products, distinguishing Ontario's contribution thereto.

The total export from Canada of the products of the forest in the year 1912 was valued at $40,892,674. Of this $25,483,532 went to the United States; $10,950,840 to the United Kingdom, and $4,458,302 to all other countries. Of the $25,483,532 that went from Canada to the United States $9,351,813 went from Ontario.

The total export from Canada of the products of the forest in the year 1913 was valued at $43,255,060. Of this $29,951,880 went to the United States; $10,103,469 to the United Kingdom, and $3,199,711 to all other countries. Of the $29,951,880 that went from Canada to the United States, $8,388,239 went from the Province of Ontario.

The total export from Canada of the products of the forest in the year 1914 was valued at $42,792,137. Of this $29,304,546 went to the United States; $10,647,123 to the United Kingdom, and $2,840,468 to all other countries. Of the $29,304,546 that went from Canada to the United States, $9,236,031 went from the Province of Ontario.

The heaviest export of forest products from Canada to the United States was in the year 1910, when $31,835,326 worth of lumber went to that market. The next largest year was in 1913 when $29,951,880 worth of lumber went to the market. 1914 comes third with only a few hundred thousand dollars less than 1913—viz. $29,304,546 worth of lumber exported to that market.

It will thus be seen that the total export of lumber from Canada in the three years 1912, 1913, and 1914, was $126,939,871. Of this $84,739,958 went to the United States; $31,701,432 to the United Kingdom, and $10,498,481 to all other countries. Of the $84,739,958 that went from Canada to the United States, $26,976,083 went from the Province of Ontario.

---

Hon. George Howard Ferguson, K.C., B.A., LL.B., M.P.P., Minister of Lands, Forests and Mines for the province of Ontario, was born at Kemptville, Ont., on June 18th, 1870. He inherited his taste for politics from his father Chas. Frederick Ferguson, M.D., who represented North Leeds and Grenville in the House of Commons from 1873 to 1896. Hon. Mr. Ferguson was educated at the Kemptville High School, Toronto University and Osgoode Hall. He was called to the bar in 1894, and was created a K.C. in 1905. His political career commenced when he was elected to the Imperial Legislature in 1905. He was re-elected in 1908-11, and 14, and in the latter year was appointed Minister of Lands, Forests and Mines. Previous to his election to the Legislature, Hon. Mr. Ferguson had been a Councillor for Kemptville for three years and had occupied the position of reeve for three years.

---

The Canadian Trade Commissioner at Bristol reports that he has frequently found complaints of carelessness in the manufacture of Canadian deals, especially those from New Brunswick. It is very important, he says, that absolute accuracy in measurements be maintained, otherwise loss will occur in cutting up in Great Britain. Canadian deals, he says, too often have waney edges, while Baltic deals are entirely free of this.

---

The forests of New York produce about 200 board feet per acre per year, or about 525,000,000 board feet per year. The annual consumption is nearly 2,000,000,000, or over three times as much as is grown.

---

Mr. Alex. Baird, who, for many years, was Superintendent of the Cowan & Company, Limited, of Galt, has accepted a position with the Canada Machinery Corporation, Limited, as Superintendent of their Hespeler factory. The company will resume operations in this plant at an early date.

## Georgian Bay's North Shore Trade

The north shore of the Georgian Bay, that is to say, the district lying between Sault Ste. Marie and Little Current, practically depends upon the United States markets for the consumption of its lumber output. Operators along the lower parts of the Georgian Bay are in closer touch with Ontario markets and have better freight rates and better facilities for shipping their lumber throughout Ontario than the North Shore firms. Without the United States market, there would probably be comparatively little production on the North Shore, until the demand runs far in excess of the supply from other sources. As it is, however, the industry upon the North Shore of the Georgian Bay is one of considerable extent and of much importance. From information which has been secured by a lumber manufacturer in one of the largest North Shore mills, the following outline of the present manufacturing and trade situation has been prepared:—

During the past winter there has been about 250,000,000 feet of saw logs taken out on the North Shore, or more properly speaking in the district between Sault Ste. Marie and Sudbury. This, of course, is more or less in the nature of an estimate, as the Crown timber agents have not yet received complete reports. Probably, when these reports are all in, and when the logs have been converted into lumber, it will be found that the total is closer to 300,000,000 feet.

The production of the North Shore mills is largely in the form of rough lumber. This is shipped to the United States markets by vessel, the cost of making shipment varying according to the distance of the point of destination. Lumber being shipped say to Saginaw, Detroit, Cleveland and similar points would cost $2 per thousand feet for freight rate. To put it into Buffalo, Pittsburgh, Boston and New York markets from Saginaw, Detroit and the other points mentioned would cost, for instance, from Saginaw to New York, $5.50 per thousand feet, to Boston $6 per thousand feet, to Pittsburgh, $3.70 per thousand feet, and to Philadelphia $5. This, of course, would be in addition to the vessel rate to Saginaw of $2 per thousand feet.

Yard men in these United States cities, who purchase the rough lumber from the North Shore, are dressing the white pine and selling it on a basis of $30 per thousand feet. The lower grades of white pine, such as 4, 5 and 6 in. strips do not bring as high a price, but better grades bring more than $30 per thousand feet. The basis of $30, however, is used today for figuring cost under present market conditions. Purchasers of stock on the North Shore today are reporting that the lumber market in the consuming districts is a great deal less active than a year ago and that prices are correspondingly lower. There is no extensive amount of buying going on and the export trade to foreign countries is apparently very quiet. Therefore, today, all the lumber markets that are of interest to the Georgian Bay operators are those of the Eastern States and Old Ontario.

So far as the Ontario market is concerned the lower Georgian Bay lumbermen, being so much nearer to the chief points of consumption obtain a very large percentage of the trade. Moreover, the lower Georgian Bay firms in most cases have the Grand Trunk and Canadian Pacific railways in competition and can get much better freight rates than the firms on the North Shore, who are dependent solely upon the C. P. R. Therefore, the probability is that less than 10 per cent. of the lumber manufactured on the North Shore has been shipped by rail to many points in Canada. Absolutely none goes by rail into the United States.

Estimating the output of logs on the North Shore during the past winter at 300,000,000 feet, it is quite a question still whether all of these logs will get to the mills this year, as many of the drives were practically hung up, according to the latest reports. One prominent firm reports the probability that out of its cut of 20,000,000 feet, about 3,000,000 feet will be hung up.

Referring to general market conditions, the report given us by the lumberman above referred to is to the effect that the lumber business on the North Shore was never in just such a state as at present. The lumbermen of the Southern States, he says, are in a position to put their southern pine on the market much cheaper than the Norway pine from the North Shore can be put there, so that the Norway market is practically gone. At one time this Norway was bringing $20 to $22. Today it is difficult to get an offer of $15. Firms which have been holding their Norway for $18 report that they have no present expectation of securing this price and that they have decided not to offer it for sale, but to hold it over in the log. Most of the mills on the North Shore had started operations early in May.

Although the market conditions referred to above are not as encouraging as one would wish, there is good reason for feeling some measure of satisfaction because the output of the North Shore for the present season has practically all been sold for export to the United States. It is certain, therefore that none of this stock will be unmarketed, or will be shipped into Ontario markets at a possible loss. The prices secured have not been so good as in former years, but all of the stock will ultimately find its way to United States markets.

# Government Aid in Marketing Lumber

By The Hon. William R. Ross, Minister of Lands, British Columbia

Hon. W. Ross, Minister of Lands, Victoria, B. C.

The enormous quantity of merchantable timber in the province, the fact that lumbering is our premier industry, the importance of our forest revenue—all these considerations combine to make the marketing of British Columbia lumber a matter that demands the closest co-operation of the Provincial Government.

Therefore, since it became evident that the existing markets for our forest products were hopelessly insufficient, one of the main duties of the Government has been to discover the reasons why, and to set to work in a practical way to remedy conditions as far as possible.

Investigation showed the need for tariff reciprocity with Australia. It revealed the grip which the shipping companies of San Francisco and the Pacific States had gained, by organization, upon the sea-borne lumber trade, so that British Columbia was almost excluded from markets within the Empire that should be naturally hers. It showed how little was known in foreign countries concerning a mysterious wood described as Douglas fir. The most grotesque misconceptions about our timber were found to be prevalent among some foreign buyers. Thus two things were clearly revealed—firstly, that a general advertising campaign to stimulate the demand for British Columbia lumber must be carried on in every accessible foreign market; secondly, definite action must be taken to supply the shipping without which the commercial expansion of our lumbering industry is impossible. With 350 billion feet of standing timber and a mill capacity of 2½ billion feet a year, stagnation will continue to be inevitable unless adequate ocean transportation is provided, for only thus can we relieve our coast and interior mills from ruinous competition with each other in the restricted Western Canadian market.

There is so much useful work that can be done by governmental agency at the present time that I do not feel that we can claim to have made more than a promising beginning at the task confronting us in British Columbia. The Dominion Government is negotiation with Australia for a tariff preference that would secure to British Columbia her proper share of a lumber and paper business running into twenty million dollars yearly, while the despatch of a Special Trade Commissioner to study foreign markets throughout the world will benefit Western as well as Eastern manufacturers. Sixty thousand dollars has been voted this year by British Columbia for the dual purpose of encouraging the sea-borne lumber trade and conducting an educational campaign directed at the consumer in the Prairie Provinces, and the user of construction timbers, finish and shingles in Eastern Canada. We want Canadians to buy Canadian material whenever possible, instead of importing pine from the Southern States. And, finally, all over the world, government departments, railroad boards, large and small importers and the timber trade generally are being given systematic and persistent information, accompanied by exhibits, concerning every way in which our British Columbia timbers may suit their needs, the stocks available and the range of prices. Australia, India, New Zealand, South Africa, China, Japan are our natural markets, while the United Kingdom and Europe generally are capable of taking from us certain products in far greater quantity than hitherto. Already we have been encouraged by new business offerings from these countries, and though, through lack of shipping, our operators have not been able to take advantage of all these opportunities, I fully anticipate that the shipping plans now being considered will effectually remove this obstacle.

---

The chief difficulty in connection with extending the market for British Columbia timber at Bristol in the past has been the cost and length of time required for shipment. Timber from Russia and Sweden has had a great advantage in this regard. It is expected that the opening of the Panama Canal will soon show that British Columbia timber can be marketed profitably at Bristol and that the demand will increase.

# A World-Wide Export Timber Trade

By H. R. MacMillan, Chief Forester for British Columbia

H. R. MacMillan, Chief Forester, Victoria, B. C.

The present war has profoundly affected the general attitude of Canadians towards economics. Many who had previously not given the situation a thought now realize the necessity of paying for our importations and for our interest charges, with exports of our produce.

The proportion of forest land in Canada is, and always has been so great, that for three hundred years, from the earliest of trading days, Canadians have paid their foreign debts with the produce of the forest. This produce has shifted from fir to pine, and now is shifting from pine to spruce, pulp and paper, Douglas fir and manufactured wooden articles. Though the proportion of forest products in our exports has decreased—it is still greater than any other country—the Western Hemisphere being $45,000 in 1913, or 1212 per cent. of our total exports. This total would be still greater if there were included in it all exports of manufactured wooden articles, the total quantity of which cannot be ascertained. The exports of forest products in Canada equal $5.97 per capita per annum. In the United States the total is only $1.37 per capita per annum. The reason for this is to be found in the fact that Canada is naturally a forest country, a condition which Canadians are prone to overlook. Of the whole of Canada only 25.9 per cent. is agricultural. The remainder of the country will produce no crop but a crop of timber. The forest is therefore our greatest resource. It is a resource so wide in area it should always, if well managed, assist Canadians in maintaining a world-wide export trade in timber products.

The future of Canada in the export timber trade may possibly be judged from the present condition of Sweden. Sweden is a country somewhat similar in forest wealth to New Brunswick, Quebec, and Ontario, only it is no greater in area than a portion of the forest regions of Ontario and Quebec. Yet Sweden, so small in area, supports an export trade in timber products of $60,000,000 per year, greater than the whole trade of Canada. Sweden has at present a great advantage over Canada, cheap transportation and the densely populated countries of Europe. The situation of Canada with regard to markets is, however, yearly improving; on the east the dense populations of the United States, Europe, the West Indies and South America are each year increasing their demands. Concurrently Canada's chief competitors, American spruce and southern yellow pine, are diminishing in quantity and competitive ability. Before the lumbermen of Eastern Canada there is opening out each year a wider export market.

On the west coast development is slower owing to the great quantities of competing timber in the North Western States. There are however, great markets in right for the Douglas fir regions, a portion of which will be supplied from British Columbia. Chief amongst the purchasers will be the densely populated countries of Asia, which are increasing each year in purchasing ability and timber requirements; Australia, South Africa and the west Coast of South America, countries which are developing in the same manner as are the Canadian prairies. The West Coast will, while not competing with Eastern Canada, ship to the Eastern States and to Europe timbers of special grades which are not produced in the east.

### Export of Finished Products Should Increase

A natural development of the export trade both in the east and the west will be a gradual increase in the proportion of more highly manufactured material shipped. Timbers and rough lumber should decrease, while pulp and paper, pulp products, doors, wood finish and trim and manufactured wooden articles should increase. Canada should consequently be always in a position to compete favorably with manufactured forest products where she can compete with any manufactured articles. Three-quarters of the country will produce timber only. Canada cannot be a great trading or commercial country unless that three-quarters of the area is productive, supporting timber industries, effective forest fire protection is therefore essen-

tial throughout every province of Canada. Forest fire protection is not more effective in Canada and already in eastern Canada no permanent extension of the export timber trade is possible for the reason that the forest has not been protected from fire and reckless exploitation.

# First Fruits of the Export Campaign

### B.C. Government Announces Good Order for Dimension Lumber—June and July Shipment for British Admiralty

Victoria, B.C., May 18th (Special to the Canada Lumberman): Hon. W. R. Ross has announced that the British Admiralty is placing an order with British Coumbia mills for 10,000,000 feet of dimension lumber for shipments in June and July. The Provincial Government was informed of its successful efforts on behalf of the export lumber trade by cable from Sir Richard McBride. Hitherto, British Columbia firms whether bidding on private or British Government orders have been able to deal only with American brokers through whom it has been the custom to place such orders. The order now secured is the first instance in which direct dealing between the Old Country and this portion of the Empire has been formally recognized as the proper method. In future, all British Government enquiries for Pacific Coast lumber will be addressed direct to British Columbia as a result of the representations made by the Provincial Government to the Home authorities. British Columbia lumbermen have also been handicapped by the control of available shipping secured by American brokers and American shipping companies which deal in lumber as well as carrying it to foreign markets. This feature was one of the main reasons for the despatch of Mr. H. R. MacMillan as Special Trade Commissioner to the United Kingdom, under instructions from Sir George Foster, whose energetic co-operation in this matter has been invaluable.

Furthermore, it was known that shipping engaged by the Admiralty was being used in the Pacific. With this in mind the Hon. W. R. Ross cabled Sir Richard McBride and the Agent General in London, and through their efforts it has been possible to secure the use of a number of British bottoms as lumber carriers from this Province on the return voyage. In the case of the 10,000,000 feet order now obtained the British Admiralty will itself make all arrangements for the necessary tonnage, thus making shipment a certainty.

The Minister of Lands, in an interview, laid much emphasis upon the success of the Province in securing this initial order. The Hon. W. J. Bowser also referred to the action of the Dominion Government through Sir George Foster, whose far-sighted work on behalf of the lumbering industry of British Columbia was very highly appreciated in this Province.

At the instance of the Hon. W. R. Ross, the Commissoner of Commerce at Ottawa, has written to every sawmill and shingle mill operator in the Province offering to supply free of charge future numbers of the Weekly Report issued by the Department of Trade and Commerce upon application.

This publication contains the various reports from the Canadian Trade Commissioners throughout the world, information on overseas markets, and a list of openings for Canadian manufacturers. From time to time there will be included the reports received from Mr. H. R. MacMillan, who is now investigating conditions in the principal markets on behalf of the Canadian timber trade in his capacity as Special Trade Commissioner. So keen is the interest shown in the States in such matters that it is necessary to print the publications corresponding to the above daily instead of weekly. It is, therefore, hoped that every British Columbia operator will take advantage of the offer, and so keep in touch with the movement for wider markets.

[Editor's note—Similarly it would be to the definite advantage of every lumber manufacturer in the other provinces of Canada to receive regular copies of the Weekly Report of the Department of Trade and Commerce, which, we understand, may be had free of charge, upon application.]

**Woodenware Coat Hangers:**—The trade in wooden coat hangers has been greatly affected by the war. These have been sent to Great Britain in large quantities in the past from Germany. These hangers should be made of hardwood and they are chiefly sold in two or three designs. For the usual circular shaped hanger which can be bought by the public at as cheap as 2c. each, German manufacturers have quoted a c.i.f. price to the importer of $1.08 per gross. Thousands of these hangers are sold in Great Britain and there are a number of firms who purchase in fifty gross lots. One Leeds firm reporting to Mr. Claude Dyer, Canadian Trade Commissioner, at Leeds, is prepared to undertake the purchase and sale of these goods for Canadian firms seeking to capture the trade.

# The Shipping Situation on the Pacific

### B.C. Firms Handicapped by Higher Costs of Production—Brokers of U.S. in Closer Touch with Trade

**From information furnished by C. Gardner, Johnson and Company, Ship Brokers, Vancouver, B.C.**

THE most important factor in connection with the export lumber trade of British Columbia today is unquestionably that of shipping facilities. There are abundant shipping facilities from British Columbia ports to trans-Pacific markets, that is to say, when conditions are normal, but it is quite certain that the bulk of the shipping business in connection with the export of lumber goes to the Sound ports, as lumber manufacturers using those ports seem to be in a better position to accept lower prices than the British Columbia mill owners. From British Columbia ports to the Orient the following lines of vessels run regularly:—Osaka Shosen Kaisha, Blue Funnel Line, Royal Mail Line, Canadian Pacific Steamships and the Russian Volunteer Fleet (to Vladivostock). In normal times the O. S. K. and the C. P. R. each run a fortnightly service and the other lines a monthly service, but on account of the war and the number of vessels commandeered by the Government, the above services are very much curtailed at present with the exception of the O. S. K. (which has continued a very fine fortnightly service from British Columbia and Sound ports to Japan, China, Manilla and India) and the Blue Funnel which is continuing its monthly service to Japan and China. In addition to these lines there are also the Nippon Yusen Kaisha, and Great Northern Steamships, which run monthly vessels from Seattle and Tacoma to the Orient. The rates on all these lines on lumber are from $10 per thousand feet B.M., according to lengths and sizes, to Japan, and $12 upwards to China, and Manilla. These liners, however, look upon lumber as an objectionable cargo and will only take it when other cargo is not obtainable, on account of the extra length of time required for handling lumber both at the loading and the discharging ports. Most of the lumber business, therefore, is handled by brokers who, from time to time charter special tonnage and ship full cargoes of lumber to various points in the Orient. The rates of freight on such charters vary from time to time in accordance with the freight market, and it is therefore quite impossible to give a reliable average rate.

#### Cost of Production Favors U. S. Mills

The shipping facilities in British Columbia are as good as those ruling at the United States Pacific ports as regards the rapidity of handling lumber and the cost, but there is no doubt that the lumber mills on the Pacific Coast of the United States have reduced their cost of production lower than have the British Columbia mills. They are therefore able to quote lower prices and secure the bulk of the business. Another important reason why so large an amount of the export trade is secured and shipped from United States Pacific ports is that practically all the lumber merchants are located there and are regularly in touch with their mills, so that, when an opportunity offers they buy a cargo, and charter tonnage to lift it, from practically their home port. One might naturally ask why they do not buy from British Columbia mills. The answer is, first, because they are Americans, and naturally give their own mills the preference on equal terms, and secondly, if they were able to secure an equal offer from a British Columbia mill they would have to take into consideration the extra cost of getting the steamer to British Columbia and back, which would mean at least a loss of three days and the extra cost of steaming the distance both ways. This is a very strong factor in preventing the British Columbia mills from getting their share of the export business. There are also lumber merchants on the Sound who control their own steamers or sailing vessels, as the case may be, and so are better able to sell lumber cargoes at a c.i.f. price, and transport these cargoes on their own vessels at whatever rate of freight the business will stand.

Practically all of the lumber export business to Australia, Japan, China and South Africa from this coast is done, as indicated above, by merchants, through the medium of chartered tonnage. Rates of freight to Australia during normal times run about 45s. per thousand superficial feet, board measure, and to South Africa about 65s., but at the present time, on account of the scarcity of tonnage occasioned by the war, it is almost impossible to make shipment. The rates which owners are asking for such business are in the vicinity of 90s. and 115s. respectively.

#### The Ship-owner and the Broker

The opening of the Panama Canal has caused quite a large enquiry on this market, as well as at the United States Sound ports, for lumber and shingles for New York, Boston, Philadelphia and other United States Atlantic ports, as well as for the St. Lawrence. A large business has already been done in this direction, but in every case lumber merchants who control tonnage have secured the business. The following firms are all in the lumber business:—W. R.

Grace & Company, Hind Rolph & Company, and the Robert Dollar Company. As each of these firms have steamers running regularly through the canal to the Atlantic, they are able to sell lumber c.i.f. and carry the lumber and shingles on their own boats. It can naturally be understood therefore, that they are always willing to give others room on their boats for parcels of lumber, but at rates which are higher than what they are charging for carrying their own lumber. This prevents the shipper who does not control tonnage from competing. Consequently these three firms have, up to the present, been able to secure most of the Atlantic lumber business. As there are no steamers running from British Columbia ports to the Atlantic Seaboard, our shippers are bound to go to the expense of shipping their lumber parcels to Seattle and trans-shipping, which expense prevents them from competing with United States Sound ports.

There is a very fine opening in this trade for an independent line of steamers, the owners of which should be ship-owners only and should give every shipper an equal chance of doing business, so long as they are willing to pay $12 per thousand feet B. M. for lumber, $1 per thousand for shingles, and about 40c. per hundred pounds, weight or measurement on general cargo. Other rates would be in proportion, and there is any amount of cargo securable both ways for a line giving monthly sailing.

There are practically no shipping facilities for carrying lumber between British Columbia and San Francisco, as the small coasting vessels that come to British Columbia have to trans-ship at Seattle. This at once prevents the British Columbia manufacturer from competing with United States coast mills, where the cheaper transportation gets them the business every time.

### B. C. Brokers Not Strong Enough Financially

There are quite a number of lumber brokers in British Columbia, but although they get the lumber enquiries for export business from time to time, they are not able to conclude transactions of any consequence, on account of the United States brokers having more direct and personal connections with the different markets, and more especially because they do not, or cannot control tonnage, as the United States brokers do. The United States broker is usually a firm of standing and strong financial position, whereas the British Columbia broker, from our experience, is not able to undertake the financial risk which his United States neighbor will shoulder. Moreover, the United States broker will, in nearly every case, control transportation in some way, either directly or indirectly. All this goes to show why most of the export business goes to the Sound, whereas, if the British Columbia lumber people would get down to a bona fide basis and show a disposition to compete with the Sound, there is no reason why they should not secure at least their share of export orders.

The above statements are made from personal experience. Take for instance an enquiry which we had a short time ago for 3,000,000 feet of square timbers for the United Kingdom for special friends of our own. We made great efforts to secure this order, but the very best price we could secure from mills in British Columbia was $9 G. list, which is looked upon as a very low cut. We felt sure that we could then secure the order. Very much to our surprise, however, our friends replied that as they had a 15 per cent. cheaper offer from one of the Sound mills they were unable to consider our offer. After receiving this information we made a further effort to get our lumber people to reduce their price, but they could not do so, as they said that the price quoted was just the bare cost of production. In view of this we think we are right in saying that the British Columbia mills must get down in their cost of production in order to compete adequately with their neighbors over the border.

Lumber is shipped from the Pacific Coast to Australia and South Africa at rates based upon the thousand superficial feet board measure. This is the only basis on which shipments are made from this coast. One thousand feet B.M. (or in other words, one mille) is practically two tons.

---

Timber sales completed by the Forest Branch of the Department of Lands for British Columbia during the month of March totalled 13,543,550 feet B.M. and 121,200 lineal feet, the estimated value being $21,900. During the month of March there was scaled in all districts of British Columbia a total of 36,322,698 feet B.M. of saw logs, 378,-853 lineal feet of piles and poles and 17,575 cords of railway ties, shingle bolts, fence posts and cordwood. The total quantity of saw logs exported from all districts in the province during March was 7,307,897 feet B.M., and the exports of piles and poles amounted to 82,890 lineal feet.

---

The imports of timber into Austria-Hungary, and the exports therefrom for the year ending December 31st, 1913, amounted in value to $5,681,609 for imports and $54,011,589 for exports. Canada's share in this trade was infinitesimal, amounting to $665 worth of timber sent to Austria.

# Trans-Pacific Trade of the West Coast

## Business Controlled by the Shippers Who Do the Least Towards the Joint Result

**Written specially for the Canada Lumberman by Niel Nielsen, Australian Commissioner to the Panama-Pacific Exposition**

THE present and future trade in lumber between the West Coast of North America and Australia is governed by several important factors. They are as follows:—

THE TIMBER ITSELF: Douglas fir has so many special qualifications that it is difficult to secure a substitute for it in any part of the world, once its uses have been made known. Its great strength, coupled with its lightness, are qualifications which stand out prominently wherever it has been introduced and secures for it a stable market.

THE FORESTS: In the first place Douglas fir grows in dense forests which contain enormous numbers of trees per acre. Secondly, these forests very often contain a remarkable proportion of trees of the same age and quality. Thirdly, it grows near the coast where water transportation may readily be used in all the earlier stages of manufacture; and then when manufactured it may be loaded directly into the deep-sea ships which take it to its destination. These two factors Nature has provided and has provided them in such a way that they could not well be more advantageous than they are.

The next factor is supplied by the manufacturers. It is

CHEAPNESS OF MANUFACTURE: This includes several sections principally

1. Scientific and systematic logging.
2. Provision of the most efficient machinery.
3. Organization and efficiency in handling.

So far Nature and the manufacturers have worked hand in hand and the result is that the manufactured lumber is produced at a remarkably small cost in proportion to the real intrinsic value of the lumber itself in use.

FREIGHT: This unfortunately is neither in the control of the lumber manufacturer nor the lumber user and therein lies the cause of the whole trouble. This fact throws the trade into the hands of the middleman, leaving the lumber industry to be controlled, not by the cost of production, not by the value in use, but by the cost of carriage from its point of production to its point of consumption.

The millers who produce the lumber have sunk too much of their money in their mills, their forests, and their machinery, trusting to luck to provide them with freight and luck has not always stood by them. Almost exactly the opposite has been the case. **In spite of the enormous amounts of capital invested by the mill owners, in spite of the energy displayed by the users, the trade is controlled by the shippers who do the least towards the joint result, yet in most cases make the most profit, and in every case control the trade, while taking the fewest risks and providing the merest trifle of the total amount of capital invested in the industry.**

Has this state of affairs been brought about by the fact that the trade is based upon an unstable foundation? I think not. True it is that the forests will not last for ever unless renewed, but there is still at hand countless square miles of virgin forest country yet to be logged, sufficient to provide for the requirements of the trade until the logged-off lands can be re-forested. The instability, if any, is therefore not in the production of the lumber. Is it in the consumption? Again I say no, emphatically no.

Australia is the largest oversea customer, the others being China, Japan, South America and South Africa. Are any of these countries likely to reduce their present consumption? Again I answer in the negative. None of these countries produce any timber that is of equal value in use consistent with its cheapness. Therefore as time goes on, the consumption will be greater instead of less. In the countries which are at present populous, the use of this class of lumber will increase because of the increased needs of the existing population, and in those countries where at present the population is scarce the consumption will increase with the increase of the population.

We have therefore stable conditions governing both production and consumption to a degree which practically puts the trade upon a permanent footing. **We therefore have but one link to add, namely, stability in the carrying trade. This can be secured if the producers and consumers act in co-operation and only by this means, and until this connecting link is supplied to the chain, the instability of the trade will continue while the controllers of the freights will fatten at the expense of both the producer and consumer.**

How are the producers and consumers to secure control of this connecting link? There are only two possible means. The first is by providing their own ships, and the second is by securing a reciprocal trade which will keep the ships constantly going back and forth from the point of supply to the point of consumption. To do this, rests upon one word—back-loading—therefore **the future stability of the trade rests upon one factor only and that is the equalization of the balance**

**of trade between the lumber producing countries and those which consume it.**

By balancing up the trade, the boats could be constantly kept upon the one run. The country that produces the lumber must not only arrange to sell its product in the lumber consuming country, but must see to it that it buys from the lumber-consuming country a sufficient quantity of the commodities it produces to fill the lumber ships on their return journey.

This needs, first, an investigation scientifically conducted of the commodities produced in the lumber-consuming countries which are required by the people in the lumber-producing countries; then a consistent agitation to remove all bars to the entry of those commodities whether such bars consist of unscientific customs tariffs or of the absence of the means of using the productions of the lumber-buying countries.

For instance taking Australia as an example. We produce many of the commodities which you require much cheaper than you can; we also produce other commodities which you require but which you cannot produce at all.

In the first category are, say, fresh meats, preserved meats, wool, hides and skins, oleo stearine, and other by-products of the pastoral industry, butter, hardwood and furniture timbers.

In the second category are, say, copra, cocoanut oil, tin ingots, gem stones, wines, pearls and pearl shell, all kinds of fresh fruits in the opposite seasons to yours, and tropical fruits and products of all descriptions, etc.

Surely a trade could be worked up in these which would fill the lumber ships on their return journey and so keep them on the run constantly and independent of outside freights.

The only other alternative is for each mill to assist in providing a lumber fleet by each owning at least one ship.

# Export Trade from the Pacific Coast

## Co-operation by Government and Banks Required to Place B.C. Exporters on a Level With Their United States Competitors

**Specially written for the Canada Lumberman by A. C. Flummerfelt**

Six years ago, when the Forestry Commission of British Columbia was appointed to make searching investigation into the lumber problem upon which the business development of the Province so largely depends, the lumbering industry of the west was enjoying a period of great activity. The early days which had witnessed the growth of a small export and domestic trade in lumber products, in which the export of seventy million a year formed a comparatively heavy proportion of the total business done, had passed away.

A great influx of population to the Canadian prairie had revolutionized the industry, and every effort of our lumbermen was concentrated upon supplying the sudden demand for building materials thus created. Eight and a half million acres of standing timber had been taken up under license during the years 1905, 1906 and 1907. Sawmills were being built at every strategic point and sending their output to the prairie markets which had at that time become more profitable than the export trade, and there was a heavy investment of British, American and eastern capital. Thus in 1910 when the Commission, of which I had the honor to be a member, was conducting its investigations, the lumber cut of the province for the year had jumped somewhat suddenly to 1,028 million feet. No less than 640 million of this total was shipped to the Prairies, less than 70 million going foreign.

This fact shows how completely the export trade had become eclipsed by the attraction of the home market, and the situation became intensified in the following years. In 1911 there was a cut of 1,200 million, prairie shipments being 760 million, and the water-borne trade being 47 million feet only. Business for the years 1912 and 1913 was similarly distributed. Hence when the building boom on the Prairies came to an end, British Columbia was left with limited markets, in consequence of which the Coast lumbermen began to turn their attention to the overseas trade, only to find that their neighbors to the south had meanwhile secured a firm grip on foreign countries. Then came the outbreak of war, followed by the scarcity of tonnage and the complete disorganization of freight rates.

Now, if we analyze the mill situation in the province, we find that out of the aggregate capacity of 2½ billion feet per annum, no less than one billion feet, or 40 per cent., is the capacity of Interior mills, whose chief market lies in the prairie provinces. During the recent past, to which I have above referred, over 60 per cent. of British Columbia's cut was sold prairie-wise. Hence the problem from both the Interior and Coast millmen's point of view is to divert as much as possible—of the Coast cut—seawards, so that Coast mills will not be obliged to compete in the limited prairie markets whose wants can be very largely supplied by the large capacity of the Interior mills. Overseas markets have therefore regained the importance which they never should have lost in the eyes of our Coast manufacturers.

In turning our attention to the overseas trade, we find that notable alterations have taken place in conditions. While, on account of war conditions, we have not as yet felt the benefit of the opening of the Panama Canal, it is obvious that that event is fore-ordained to effect radical changes in the world's lumber trade. In the first place, the canal will provide a new outlet for common lumber. If, as at present, eastern American cities can pay $20 to $25 for common grades of British Columbia lumber which sell for $8 to $12—and on which a freight rate of about $8 through the Canal can be anticipated,—will unquestionably be able to secure a large portion of this trade. The entry of this new material into the Atlantic Coast markets comes at a very opportune time, for supplies from the northeastern States are shrinking rapidly and the cut of the South has passed its zenith. My conviction is borne out by the U. S. Treasury reports, which state that the average price of Douglas fir exported in 1912 was $12.28, while that of long-leafed pine averaged as high at $20.91. Needless to say, there is no single factor which could have a more potent influence upon the export business than a wider sale for common lumber and the smaller sizes cut from sidings yielding high grades. With the added enormous demand which Europe is about to make upon the lumber producing centres of the world, British Columbia should, and in my opinion will, participate more largely in the world lumber markets than ever before.

This business, however, is absolutely dependent upon adequate shipping facilities. In early days the export trade in Douglas fir was carried on by means of sailing ships. At that time mills doing an export business chartered on speculation, often a year ahead, and were thus in a position to quote c.i.f. prices. This situation was entirely changed by the entry of tramp steamers into the trade. Large merchandising and shipping companies centering in San Francisco gradually gathered large fleets on time charters and established connections in foreign countries which enabled them to obtain return cargoes. The unorganized individual manufacturing concerns of British Columbia were unable to compete with these extensive organizations in making c.i.f. quotations. Similar commercial developments did not occur in British Columbia, because, as I have said before, the tempting prairie trade absorbed our manufacturers' attention. The result is that the lack of shipping from British Columbia ports has now become the main obstacle to the re-entry of our province into its natural overseas markets. In addition to this, the chaotic condition of the shipping business throughout the world, due to the war, creates a temporary situation that is unprecedented. Thus, for example, rates per M. on shipments to the United Kingdom have advanced since the war began from 68 to 70 shillings to 130-150 shillings, and even at these prices very limited tonnage is available. Thus for the time being we are powerless to take advantage of the abnormal demand.

But although one can see little that can be done (unless interned German steamers can be secured from the Imperial Government) that will immediately lift this temporary incubus upon our trade, it is apparent to any business man that some unusual steps must be taken at once or some plan devised to enable the British Columbia manufacture to take advantage of the business offering as soon as present abnormal conditions have passed away.

**In my opinion the following are requisite and essential:**

**1. The organization of a single selling association managed by the export mills, business being distributed pro-rata to members of the association according to their mill capacity.**

**2. Active support from the Provincial and Dominion Governments in pushing the sale of British Columbia lumber in every market.** I am glad to recognize how much the timely and energetic action of the Honourable W. R. Ross has already demonstrated the effectiveness of Government action, looking toward the securing of such definite changes as reciprocity with Australia, which would probably bring about as great an increase as experienced in the South African trade—in the last ten years from 17 to 64 per cent.

**3. Co-operation by the Bankers' Association of Canada, so that the financing of bills of exchange should be shared among the banks, just as the export of lumber would be shared among the mills.**

**4. The establishment by the Government of some system of royalty rebates or ship subsidies so as to guarantee the necessary minimum supply of shipping** which will secure the progressive, continuous growth of a solid export trade for British Columbia lumber.

# Australia and the Orient

**Written Specially for the Canada Lumberman by a Lumberman with wide Export Experience**

**An Analysis of the Market Situation from the British Columbia Point of View.**

IN analyzing the export trade to Australia, and seeking the reasons for British Columbia falling off in shipments there for the past few years, the fact stands out that any useful deductions require the trade to the Orient and Antipodes to be considered together.

Lumbering in every part of the world is in the same position in regard to inability to manufacture solely the market requirements. One has to make whatever the logs yield, and not what any one market calls for entirely. Consequently the art of marketing consists, not in selling the plums for which buyers will always compete, but in quitting the lemons to the best possible advantage. European mill men have got this down to a fine point, and will not sell their popular goods except in combination with others of a less saleable character.

Australia requires the highest grade goods of any market in the world, and probably not more than 30 per cent. of the average B. C mill product is now disposed of there. The remaining 70 per cent. constitutes the factor that must have an outlet found for it, and this is the direction in which B. C. enterprise should be applied. Australia will take all that the Coast mills can make of suitable goods, and that she cannot get all she requires from that source of supply is shown by the details of Swedish and Norwegian goods that are imported, which figures are given later.

The U. S. A. Department of Commerce shows the following figures of lumber exports for the past three years:—

| | 1912 | | 1913 | | 1914 | |
|---|---|---|---|---|---|---|
| To | M. Ft. | Value | M. Ft. | Value | M. Ft. | Value |
| Australia ... | 241,919 | $3,934,221 | 289,207 | $4,860,854 | 260,395 | $4,218,719 |
| (Average values $16.26 per M.) | | | | $16.80 | | $16.20 |
| China ... .. | 38,719 | $404,854 | 95,537 | $1,060,318 | 107,506 | $1,098,149 |
| (Average value $10.46 per M.) | | | | $11.07 | | $10.21 |

These Government figures show that the U. S. A. increased her Australian exports in 1913 by 20 per cent. of the 1912 total, and while 1914 shows a loss as regards the preceding year, the figures still show a gain of about 10 per cent. in 1914 as against 1912. There is no doubt that the increase would have continued at the higher rate if war had not upset shipping movements.

The China exports show a gain of 150 per cent. in 1913 over the trade of 1912, and a further gain of 12½ per cent. in 1914 over the preceding year; in other words the China market took over 2½ times the quantity in 1914 that was shipped there in 1912.

### The Chinese Market An Important Factor

Bearing in mind the relative values of goods taken by these two countries (Australian average for the three years is $16.42, and for China $10.58—the 1913 high average for China was probably due to shipment to Hong Kong for special purposes, of goods higher valued than usual, which raised the average). Two facts stand out, namely, the stability of prices realized, and the great help that ability to use the China market affords in securing the Australian trade.

The same facts are apparent in the Siberian trade through Vladivostock, Harbin, etc. The timber stands in that country are anywhere from 500 to 1,500 miles from mills, and shipping ports. The trees are over-mature, rotten, and coarse, to such an extent that one is quite conservative in stating that not 50 per cent. of them would be taken if one had any option in the matter. Yet in 4 years the trade grew from nothing in 1909 to 42,000,000 ft. B.M. to Australia, and 8,000,000 ft. to the United Kingdom in 1912, and at very attractive prices as the "broads" (3 x 12/20) fetch up to $50 per M., being sizes not usually made by the European mills, and which have hitherto been shipped by Canada and the U. S. A. No exact figures are available as to what China takes from this territory, but it will probably be about 80 per cent. of the cut, and without this outlet for a large proportion of the make in common goods it is a fair inference that not a foot could be exported, or in fact operations carried on at all. China can be exploited to an indefinite extent, as one is warranted in saying that educational work in the matter of lumber will create a demand unthought of by those not familiar with conditions there, but it is association work that must create the demand, as no individual exporter can possibly cover the ground properly.

### Comparative Figures of West Coast Exports

The feeble showing of B. C. in the China trade probably arose from the fact that up to early 1913 the local and rail trade took care of a much greater part of the lower grade goods than has since been the case.

The following statistics show the exports from the West by states and destinations (except for 1911 where separate figures for China and Japan are not available):—

| | | Australia and New Zealand ft. B. M. | China ft. B. M. | Japan ft. B. M. |
|---|---|---|---|---|
| British Columbia | 1911 ... ... ... | 26,665,409 | 2,966,101 | |
| | 1912 ... ... ... | 25,788,248 | 5,400 | 2,705,283 |
| | 1913 ... ... ... | 10,750,629 | 452,412 | 4,723,745 |
| | 1914 ... ... ... | 8,746,065 | 1,290,139 | 2,082,327 |
| Washington | 1911 ... ... ... | 114,695,869 | 27,832,314 | |
| | 1912 ... ... ... | 115,294,033 | 18,366,900 | 4,109,462 |
| | 1913 ... ... ... | 133,095,368 | 39,140,717 | 9,175,183 |
| | 1914 ... ... ... | 147,407,568 | 45,281,774 | 6,633,423 |
| Oregon | 1911 ... ... ... | 33,536,541 | 50,998,868 | |
| | 1912 ... ... ... | 67,560,860 | 42,493,027 | 9,175,183 |
| | 1913 ... ... ... | 103,539,470 | 66,836,447 | 6,633,423 |
| | 1914 ... ... ... | 49,661,547 | 78,362,450 | 4,744,347 |

Japan has a bearing on the questions under discussion, not so much in the matter of lumber as in the adjustment of trade in general. Her lumber purchases from the U. S. A. were:—

| 1912 | | 1913 | |
|---|---|---|---|
| Feet | Value | Feet | Value |
| 14,533,000 | $190,723 | 14,499,000 | $208,083 |
| (Average value $13.12) | | (Average value $14.35) | |

### The Balance of Trade

Taking the total values of all goods exchanged between the U. S. A. and the countries named the figures show as follows:—

| To | 1912 | 1913 | From | 1912 | 1913 |
|---|---|---|---|---|---|
| China ... .. | $36,743,322 | $34,241,569 | China ... .. | $33,797,619 | $43,780,323 |
| Japan ... .. | 53,478,046 | 57,741,815 | Japan ... .. | 80,607,469 | 91,633,240 |
| Australia ... | 47,365,867 | 52,708,168 | Australia ... | 12,137,299 | 15,450,442 |
| | $137,587,235 | $144,619,552 | | $126,542,387 | $150,864,005 |

The writer has not the necessary figures relating to the trade between the countries cited (Japan and China to Australia, and vice versa) to prove the axiom that commodities pay for commodities (imports pay for exports) but feels little doubt that it applies, and the net balance of trade (of six millions odd in 1913) shown by above figures is adjusted through Great Britain, probably at a cost of double exchange. Any action on the part of the Canadian Government whereby exchange of trade, in any commodity, is faciltated with any of the above countries must have a beneficial effect, indirectly but surely, on the lumber industry.

Our friends to the south have consistently cultivated the China trade as is shown by the figures for the past ten years:—

| | | | | |
|---|---|---|---|---|
| 1905 ... ... ... ... | 13,910,784 | 4,838,004 | 49,460,945 | 80,285,114 |
| 1906 ... ... ... ... | 23,937,218 | 4,595,753 | 86,338,765 | 101,299,343 |
| 1907 ... ... ... ... | 24,336,690 | 5,617,248 | 91,151,263 | 92,246,093 |
| 1908 ... ... ... ... | 20,538,674 | 3,806,283 | 77,461,857 | 88,386,956 |
| 1909 ... ... ... ... | 27,703,054 | 9,883,480 | 58,855,283 | 70,481,705 |
| 1910 ... ... ... ... | 34,254,050 | 2,948,729 | 100,946,445 | 109,244,082 |
| 1911 ... ... ... ... | 26,665,409 | 2,966,101 | 148,232,410 | 78,831,174 |
| 1912 ... ... ... ... | 25,406,046 | 2,710,683 | 173,668,279 | 74,820,467 |
| 1913 ... ... ... ... | 10,100,036 | 5,176,157 | 228,673,576 | 122,442,362 |
| 1914 ... ... ... ... | 7,535,776 | 3,372,466 | 185,217,630 | 132,498,033 |
| Totals for 10 years. | 214,387,737 | 45,914,904 | 1,200,006,453 | 950,535,329 |

These figures show that in the ten years 17¾ per cent. only of B. C. shipments to the Orient, etc., went to China and Japan, against 44 per cent. of the U. S. A. movement. Furthermore if the reader will turn to the figures given previously, showing China and Japan separately, and recall the fact that Japan takes higher grade goods than China, he will find that B. C. has exported considerably more to Japan than China, whereas the U. S. A. sends only a comparatively negligible quantity to Japan when compared with her China trade. And those conversant with both trades are of the opinion that Australia would take a considerable part of the goods that go to Japan and pay better prices.

### United States Now Reaping Its Reward

The U. S. A. is now reaping the benefit of cultivating the trade in the way she has, by having a very firm hold of the market, and is also fully alive to the possibilities of further expansion. The Government has had for some months a representative there in the interests of the industry, and also one of the most successful and prominent shipowner lumber exporters has been down recently with a view to strengthening his hold on the trade, and his past success safely assures the fact that his visit will have definite and practical results.

The Pacific Coast stands geographically as the natural source of supply for wood goods to the countries under discussion. The timber

is there; the mills are in existence to take care of the demand; prices for the past few years would seem to compel the trade to come that way. Freights are lower than from competing points of supply, being normally about $12 as against $15 from Europe. Loss of interest, and chance of depreciation, are less by reason of the shorter time in transit. Yet Sweden and Norway figure very largely in the Australian trade—and they are exactly in the same position as B. C. in respect to only having a limited output of goods suitable for the market. Australia stands as Europe's second heaviest buyer of planed goods, being outranked only by Great Britain, and her imports from Scandinavian countries were 95 per cent. floorings, matchings, and other dressed material. The remaining 5 per cent. is very largely 3 x 9 x 11 red deal. It is not a question of price that enables the European mills to retain a firm hold on the market, and also considerably extend their trade there each year. The secret of their success lies in their careful study of the trade and its requirements and attention in detail to the local needs. The statistics for 1912 and 1913 were as follows:—

**FROM SWEDEN**

| | SAWN GOODS | | | | | | | PLANED GOODS | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 9" and up Broad. | | 6 to 8 inches. | | Under 6 inches. | | | 9" and up Broad. | | 6 to 8 inches. | | Under 6 inches. | | |
| | Red | White | Red | White | Red | White | Total | Red | White | Red | White | Red | White | Total |
| 1912—Ft. B.M.— | 1,702,560 | 103,020 | 1,381,680 | 69,600 | 224,220 | ..... | 6,472,080 | 1912—Ft. B.M.— ..... | | 22,220 | 6,326,640 | 13,723,880 | 181,800 | 2,389,660 | 22,644,20 |
| 1913— | 3,263,360 | ..... | 1,955,360 | ..... | 244,420 | ..... | 5,508,140 | 1913— | 216,140 | 1,012,020 | 7,465,920 | 20,745,400 | 1,119,080 | 3,472,380 | 34,030,940 |

| | Ft. B.M. |
|---|---|
| From Norway planed goods, 1912 ... ... ... ... | 39,082,512 |
| From Norway planed goods, 1913 ... ... ... ... | 62,625,883 |

Recapitulation of imports from Norway and Sweden:—

| 1912 | Sawn | Planed | Total |
|---|---|---|---|
| Sweden ... ... ... ... | 6,472,080 | 22,644,200 | |
| Norway ... ... ... ... | ..... | 39,082,512 | |
| Ft. B.M. ... ... ..... | 6,472,080 | 61,726,712 | 68,198,792 |
| 1913 | Sawn | Planed | Total |
| Sweden ... ... ... ... | 5,508,140 | 34,030,940 | |
| Norway ... ... ... ... | ..... | 62,625,883 | |
| Ft. B.M. ... ... ... .. | 5,508,140 | 96,656,823 | 102,164,963 |

The principal demand in sawn goods is for 3 x 9 Swedish red in 2nd (normal value about $34.75), 3rd ($27.50), and 4th ($25.25) f.o.b. respectively, sometimes with a proportion of 5th ($21.75) to cover and protect any better goods needed for deck load. Any white deals shipped will be 1st ($28.75), and 2nd ($25.00). The normal f.o.b. price for floorings will be based on 1 and 6 Colonial assortment being $25 for white, and $26.50 for red goods.

### Necessity For Exactness in Sizes and Grades

A great factor in the Scandinavian hold on the trade is the extreme care used in seasoning, or conditioning, the goods before shipment, and another important point is in manufacture being very regular. Planing to exact thicknesses is required. Both in Australia and South Africa the goods are handled on the measure they hold up, and not on the nominal (measure before planing) as in Europe. For instance a board ⅞-inch, reduced to ¾-inch in dressing, is bought and sold at the latter measure, and if it is shy or scant will only be accepted in resale as ⅝-inch. Swedish goods are dressed—taking square edged flooring for example on ⅛-inch in thickness, ¼-inch in width; t. & g. flooring same in thickness, ½-inch in width. Dressing on these measures could not be done except for the fact that goods are properly seasoned—naturally, and not kiln dried.

A description of the sort of timber being worked will probably give a practical mill man a better line on grading than any other method of description will do. In Europe the grading varies somewhat with the different mills and districts; in consequence the marks owned by the most careful mills situated so as to get the best logs command higher prices than marks from mills not so favourably placed, or in which buyers have not as great confidence.

The red is from Pinus Sylvestris (also called Northern Pine, Scots fir, Swedish yellow, etc.) is a hard pine, but with less resin contents than others of same class. It approximates to Douglas fir in respect to weight, resin, variation in number of annual rings, and proportion of summer wood. Douglas fir is rather coarser grained, slightly harder, and does not work quite as well as the Baltic red, but the variation between the products of different districts is more in the red than the variation of Douglas fir from different ports—say Alberni and Columbia River. The European trees average about 90 feet (extreme say 140 ft. by 5 ft. diameter in old trees) and of such diameters as to make it uncommon to square 15-inch sound timbers. Very little above 12-inch by 30 feet comes to market, and not much of that. Practically 3 x 11 is the largest size cut, and that in limited quantities. This tree gets rid of its branches only about one-third of the way up, whereas Douglas fir sheds them about two-thirds that height, so its greatest diameter, with this fact, sets up the inference that it should yield cleaner lumber.

The Baltic white is from spruce (Picea excelsa, Norway spruce) and grows about the same height as the red, not quite as large in diameter, and is clothed closer to the ground than the red, consequently carries a greater number of knots which makes it more difficult to work. Both the red and white are straight grained, tough, and elastic woods, neither being quite so stiff as Douglas fir under load. The red is probably inferior in strength to the fir, but not very much, while the white will be decidedly so, as is the case with any spruce. Its principal use is in joinery, prepared goods, and fir joists, and scantlings in a cheap class of buildings, but for work of any pretention red is always specified.

The intimate relationship between the command of suitable tonnage, and success in the lumber is established by the history of the Scandinavian trade and emphasized by U. S. A. records.

### Ownership of Vessels Established Norway's and Sweden's Trade

In the eighties for various reasons British shipowners sold out to the Norwegians a great deal of sail tonnage, which by class, and age, could only be employed in carrying wood, coal, and ice cargoes; some was classed sufficiently high to permit of its use in the summer season for the St. Lawrence with the cargoes specified. From 1880 to 1890 the St. Lawrence spring fleet was composed of very many vessels under the Norwegian flag, which took wood cargoes from Scandinavian ports to London, or English Channel ports, and then proceeded to the St. Lawrence in ballast. They would often do also a voyage from Scandinavia to the United Kingdom or continent in the fall. Possession of this tonnage, practically confined to lumber cargoes, placed both Sweden and Norway in an excellent strategic position to build up the trade in that commodity, and enabled Norway to take a commanding position in the industry which her timber stand resources hardly seemed to warrant. Her forest acreage was less than half that of Sweden, and probably not 3 per cent. of Russia in Europe. Even to-day she stands pre-eminent in the planed goods trade—although her exports for 1913 were only about two-thirds those of 1906. Her total exports of wood goods of all kinds are only about 60 per cent. of the 1909 volume. The statistics show that Sweden exported to Norway about 70,000,000 ft. B.M. lumber, more than half of which consisted of red and white battens and boards from 4 to 8 inches wide, most of which doubtless passed through her planing mills, and was re-exported. Norway's exports will decrease still more in the near future owing to diminution of suitable mill timber, but her hold on the trade in planed stuff, and her international reputation for these goods, is so valuable as to cause Russian exporters who have recently embarked on the prepared goods manufacture to advertise that their mills are "under Norwegian management, and with Norwegian workmen." Without the absolute assurance of stability to the trade that was given by the possession of tonnage to move their goods it is doubtful if the capital investments would have been so heavy, or the consequent high skill of her planing mill staffs developed.

### Control of Tonnage on the Pacific Coast

The establishment of a regular line of steamers, sailing monthly, from the Scandinavian ports to Australia led undoubtedly to a gain of over 10,000,000 ft. B.M. (nearly 50 per cent.) in the planed goods exported by Sweden to Australia in 1913 as against 1912. And no doubt the figures for 1914 will show a further gain, when they come to hand, as the range of loading ports has been considerably increased.

Recent events in the U. S. A. also show that tonnage controlled in the same territory as the export mills plays a big part in getting trade. In B. C. some operators state that the U. S. A. has cheaper labor. The States say that B. C., by the use of Chinese labor, has cheaper production, and that its stumpage costs less. B. C. states that supplies, machinery, etc., are higher priced. And so far as actual costs of operations are available they show but little difference between Washington, Oregon, and British Columbia, with the present cut in wages this will be wiped out, and both territories placed on a par. British Columbia has lost orders lately to her southern neighbors, and to try and deduce the reason for the U. S. A. being able to get tonnage where B. C. failed, the writer looked up the owners of 19 fixtures over the past 9 months from Washington ports to Australia, etc., and found they represented 13 owners (mostly San Francisco domicile) with 107 sailing ships, ranging from 900 T.N.R. down, of a total net register of 76,108 tons.

In several instances mill men in the U. S. A. say that certain shipping concerns that own, or have control of, steam tonnage, and also speculate by buying lumber now dominate the market and are

responsible to some extent for the low level of prices. If such is the case, as it surely appears to be, it simply upholds the foregoing statements as to the vital need for tonnage to be assured. Lumber will always have to give way to other cargoes offering if competing in the open market as it is expensive, and slow, in handling, and time is money always with steamers as with most other things.

Certain firms in Scotland, and on the east coast of England own and operate their own timber limits, saw mills, and steamers, and they are amongst the largest and most successful lumber concerns. It is difficult to estimate too highly the help that control of tonnage is to them.

### What The Situation Requires

The facts and figures presented herein warrant the assertion that strenuous efforts should be made by all concerned to extend the China trade. This would place shippers in a better position to regain their proper standing in the Australian market.

As well as sending samples of what we have to sell in lumber it would be a very useful educational effort to have on view, at the coast, exhibits of the various grades of lumber sent from Europe to Australia, South Africa, and the United Kingdom as this will clearly set up the fact that at present British Columbia is not exporting as much of the lower middle grades as the market will take, and in all probability this would lead to some alteration in the grading rules now governing export—in favour of shippers. These might also be supplemented by photographs as, while not at all satisfactory by themselves, they will convey information when used in conjunction with actual specimens. Care should be taken to get representative stocks—not the highest, or the lowest. If any one is sufficiently interested the editor will be able to give these marks in sawn and planed goods that would be best for this purpose.

The question of tonnage is most difficult to make any suggestions about. An eminent authority—as Mr. H. D. Langille, of Portland—says that B. C. using British bottoms is better off by 20 to 25 per cent. in freights in reaching the Atlantic U. S. A. markets. And where American ships are used in other trades (Sydney for instance) the same disability would seem to apply. Sweden and Norway pay a higher freight than B. C., yet these countries retain and enlarge their trade while B. C. slips back. The importance of ending the present unsatisfactory state of the lumber industry cannot be overestimated in view of the dependence of the community thereon for a great part of its living. The railways have been subsidized, agriculture has had help from the Government, a great deal of the population has been attracted by Government effort, all of which make a strong case for Government assistance either by subsidies, loans to secure the necessary tonnage, financial assistance to build them or in some other way that nature and thorough consideration shall show to be best adapted to the end in view. The general welfare is too deeply bound up with the industry to allow the situation to continue, and even if some part of the evils should be the result of excessive capitalization, and consequent over-production, no efforts should be spared to deal with the matter as it exists.

## China Customs Duty on Wood

The tariff on wood entering China includes the following:—

| | Quantity | Rate of Duty |
|---|---|---|
| Timber: | | |
| Beams—Hardwood | per cu. ft. | .02 tael |
| Softwood, including Oregon pine and California redwood, on a thickness of 1 inch | 1000 sup. ft. | 1.15 tael |
| Laths | per 1000 | .21 tael |
| Masts and spars—Hardwood | | 5% |
| Softwood | | 5% |
| Piles and piling, including Oregon pine and California redwood, on a thickness of 1 inch | 1000 sup. ft. | 1.15 tael |
| Planks, hardwood | cubic foot | .02 tael |
| Planks and flooring, softwood, including Oregon Pine and California Redwood, and allowing 10 per cent. of each shipment to be tongued and grooved; on a thickness of 1 inch | 1000 sup. ft. | 1.15 tael |
| Planks and flooring, softwood, tongued and grooved, in excess of above 10 per cent. | .... | 5% |
| Railway sleepers | .... | 5% |

Note:—Haikwan tael, is reckoned at 2s. 5/16 d. (about 49 cents).

## Japan Customs Duty on Wood

The tariff on wood entering Japan includes the following:—

Cut, sawn or split, simply:—

| | Quantity | Rates of Duty |
|---|---|---|
| Oak | .... | 5% |
| Pine and fir | .... | Free |
| Cedar not exceeding 20 centimetres in length, 7 centimetres in width and 7 millimetres in thickness | .... | Free |
| Other cedar:—not exceeding 65 millimetres in thickness | Cu. Met. | 3.1 yen |
| Other cedar | Cu. Met. | 1.8 yen |
| Picture frames and mouldings | 100 kin | 8.1 yen |

Note:—Yen = 49.8 cents. Kin = 1.3228 lbs.

# B. C. Export of Lumber and Shingles

### Shippers Have Serious Difficulties to Meet—Shingle Trade via Panama Made a Bad Start

(Contributed by our Vancouver Correspondent)

We are passing through a period of uncertainties,—a period of lack of confidence,—when people think but don't know. Such periods in the world's history are unhealthy for business. Even though the causes may differ the result is invariably the same, and it is always most keenly felt in the export trade, for the reason chiefly, that when people are spending freely they like variety, but when the purse strings are tight they can get along with the home production.

At this particular time, under the economic conditions brought about by the greatest of world disasters—**War**—unusual difficulties are placed in the way of export trade, such as high ocean freight rates and the scarcity of tonnage. So many vessels are engaged in the service of the belligerent nations that it is almost impossible to obtain tonnage for ordinary commercial purposes at any price. Lumber being a bulky and low rate commodity, is one of the greatest sufferers, and more particularly so on the Pacific Coast, on account of our greater distance from the various markets where the shortage is felt at this particular time, such as the United Kingdom, where their ordinary supply from Baltic ports is practically shut off, and also France and Belgium. The spruce deal manufacturers of Quebec and the Maritime provinces, and the yellow pine people of the South Atlantic, are better situated to serve this demand than we are, owing to the shorter distance. A tramp steamer can reach Liverpool from Eastern Canadian ports in about eight days, whereas from Vancouver it will take three times as long. It is plain, therefore, that we are at a serious disadvantage in reaching European markets; also that the higher the rate the greater our disadvantage.

For instance, suppose the rate on lumber from Halifax to Liverpool in normal times were $5 per thousand feet, and from Vancouver $12.50, we thus are at a disadvantage of $7.50 per thousand feet; but suppose the rates double—then from Halifax they are $10, and from Vancouver $25, therefore the disadvantage is $15 per thousand feet, or, in other words, the disability increases at the greater distance as rates advance. At the present time, rates have more than doubled—they have almost trebled in fact, which makes the disadvantage under which British Columbia exporters are laboring almost prohibitive. On the other hand, the manufacturers of spruce in Quebec and the Maritime Provinces are selling at higher prices than they have been able to command for years—in fact higher than many of them have ever received, as sales of spruce deals are reported at $22 per thousand feet alongside vessel, while $15 has been considered a good average price for many years past. If Douglas fir were bringing $22, mill run, alongside vessel in Burrard Inlet, there would be few idle mills in British Columbia today.

But while we are at a disadvantage in serving European markets, there are portions of the earth's surface that we are about as well situated to serve as anyone, and if our lumbermen in recent years had devoted as much money and thought to building or purchasing a few steamers or sailing vessels and establishing foreign selling connections, as they expended on real estate speculations, they might now be enjoying a much greater portion of the world's trade in forest products.

In regard to the British Columbia shingle industry the situation is different, the market for shingles being almost entirely on this continent and therefore not dependent on cargo transportation—in fact the scarcity of tonnage is no disadvantage to the shingle trade, and perhaps rather a protection. Previous to the opening of the Panama Canal very few shingles were shipped by water, and the rail trade had grown and become established right across the continent to the shores of the Atlantic. As rail rates are fixed, our manufacturers were on a par in reaching those markets, but on the opening of the Canal certain steamship companies put on lines of steamers, and instead of accepting freight at uniform rates, as the railroads do, they launched out as traders, buying from the manufacturers on the Pacific Coast and selling to the dealers on the East Coast. This plan proved to be a disturbing factor, as the transportation companies sold to the dealers at lower prices than prevailed for rail deliveries. They continued to take around unsold cargoes during the winter months, when the demand for shingles is very light on the East Coast, and as a consequence bargain prices prevailed and speculative buyers filled up with stock. Spring buying did not manifest the improvement over fall prices that is usually a feature of the market. Indeed prices were lower than they were the previous fall. Some dealers were supplied, while others hesitated to buy, expecting still greater bargains in water shipments.

When the spring retail trade started up, those who had invested in cargo shingles found that they did not have as desirable an article as they had expected. The shingles were wet and heavy. The covers

were marked with hob-nails from the trampling of the stevedores. The bunches were loose and irregular from the rough handling. The edges of the shingles were broken by the vessel's slings, and some were stained and dirty from smoke, coal dust, etc. They noted also the absence of the familiar brands that had been favorably known in that market, as the bulk of the shipments were picked up from outlying mills that were not conveniently situated to make rail shipments, and for that reason were satisfied to accept lower prices. In many cases the eastern buyers "passed up" the bargain shingles for the light, clean, symmetrical bunches bearing favorably known brands that had been shipped by rail, and in most cases cheerfully paid higher prices for them. Gradually the demand for rail shipments improved, but it is harder to move prices up than down, and as yet there has been but little recovery. The trend is upwards, however.

Just what would be the effect on the shingle industry under normal freight conditions is problematical. It is possible that with foreign bottoms offering, the manufacturers could get into the game and compete successfully with the trading companies, but the proof is already evident that the eastern dealers prefer rail shipments for several reasons, viz., that they arrive in better condition; in desirable quantities; with dependable regularity; and also that the building contractors prefer the dry shingle to the green.

The irregularity of water shipments would be partly overcome by a regular line of steamers operating between British Columbia and New York City. This would necessarily involve a Canadian customs officer being stationed at the port of New York. The matter has been mooted, but it is understood the railway interests are strongly opposing the suggestion.

# Analysis of the Export Trade of B. C.

## The Australian Market—How U. S. Firms Have Beaten us by Controlling Shipping—Other Important Factors Discussed

**Written specially for the Canada Lumberman by E. H. Newton**

CAUSE for considerable satisfaction in all circles in British Columbia has been given by the activity which is in evidence in lumber circles in the formulating of plans for re-capturing the trade which we have lost in Australia and other foreign markets, and for pursuing prospects of new markets in Europe. The loss of anything of value is not a thing of pleasant memory, and therefore not a heartsome thing to discuss, and so I trust that those who read this article will not blame me if everything contained in it is not pleasant reading. It will be my aim to hew to the line, but I have no desire to drop the ships on anybody's toes.

In looking over the lumber business of British Columbia covering the past few years, and examining it from every angle from which we are able to get a glimpse, one might at first feel inclined to ask many questions, and particularly is this so in the case of the inquiring minds of those who are not lumbermen. When we search into the depths of the mysteries though, (for that is what some people call them) they are not so great as many seem to imagine. We admit that we lost our grip on the Australian trade for the time being, but when all the circumstances are taken into consideration there is nothing about that loss that seems extraordinary. Many things for which the lumbermen cannot be held responsible, and some perhaps for which they can, contributed to that and other losses, the conceding of which brings to the fore many different opinions, but they do not alter the fact that in 1902 we supplied 33 per cent. of the total consumption of Pacific Coast forest products in Australia, while today we hold less than four per cent. of that trade. The Americans during that time have increased their trade in that market 390 per cent., while we have lost fifty per cent. of what trade we had there at that time. It must be admitted though, in explanation of this, that the American trade at home did not increase in proportion to their capacity during those years as did ours, and thus, while they had to reach out for more trade in Australia in order to keep their mills going, we had to drop some of ours, partly through want of proper connection and transportation facilities, and partly for the sake of taking care of home trade, which was more profitable. It must be remembered also that the American firms had been in business in a large way for many years prior to 1902, and had their mills built and fully equipped and were yearning for the business when it came, and have also enjoyed the heartiest co-operation and encouragement of both the government and the banking institutions of that country, while we at the same time were very poorly equipped for handling a large volume of trade, and when it did come it was in such unprecedented volume that we found we had to build mills to enable us to cope with the situation, and that was done as fast as money and the available supply of men could do it, but not in time to enable us to hold fast upon our Australian trade and at the same time guard our home market against American invasion. Therefore we were not exactly crowded out of the Australian market, but simply could not take care of it at that time.

### The Influence of the Prairie Markets

It must not be forgotten that the great Canadian West rose up, as in a day, and for a time it was a considerable undertaking to supply the demand for lumber in this market. It is also a thing of sorry rememberance that although we were obliged to pay thirty per cent. duty on the machinery for the equipment of our mills, yet the bars were left down for the free importation of American lumber into our market. This created a keen competition, and many of our then existing mills were run day and night in an effort to hold our markets against invaders, and this along with the rapid growth of the industry and the ever increasing demand upon labor from other sources left us with insufficient labor to satisfy the demand made upon it, and as a consequence wages went soaring.

At this interesting stage of the game our provincial government became an antagonistic competitor by fixing a minimum rate of $3.00 for an eight-hour day on all government, or civic works, which made it impossible for us to get the efficiency in labor at even $3.00 per day in the mills here, which the mills across the line could get at $2.50 per day, because men with sufficient intelligence and life to make good mill men could get more than the minimum fixed by the government at other work. This worked a very great hardship on the mills of British Columbia, as it not only prevented the mills here from building up and educating an intelligent and efficient staff of mill labor, which is undeniably one of the greatest secrets of success in any business, but it also automatically put up the bars between us and any business which had to be handled on a close margin of profit even under more favorable circumstances. In other words, it let the Americans in where we could not go, even into our own markets.

### The Export of Cedar Logs

I concede the point in part, that logging is perhaps more expensive in some sections in British Columbia, aside from the extra cost of labor and other impositions, than it is on the American side, owing to the rougher coast line from which the timber must be taken, but in the main, this argument does not hold good, and proof of this is found in the fact that the Americans are always ready to clean up any surplus of logs that our loggers may have in the water just as soon as the embargo is lifted, or partially lifted, as reports of shipments in the past few months show. As there is considerable risk in towing logs from here to the Sound mills, it is hardly likely that they would come over here and buy and take that risk if the logs cost them more than logs in their own market. The Americans are known to be good business men, but it is not on record that they are great philantropists in such matters as these. There is one reason, though, why they will take our surplus whenever they can get it, and that is, that it conserves their own supply just that much, or helps to make a surplus in their market, and consequently easier buying for them. But there is a greater reason than this, for it must be remembered that our American friends camp right on their job for six days in the week, and they know that when our mills are loaded up to the limit of their buying capacity, and there is a great surplus of logs in the water seeking buyers, and the Government seeking the royalty, and the teredo seeking to deprive the Government of its dues by destroying the logs, it is their move next to deprive the teredo of his prey, protect our Government against loss of revenue, and incidentally, of course, put our mills up against a stiffer market when they want to buy again, and so they make it known that they are in the market for logs. The Government, to protect the people from loss of revenue, lifts the embargo, and the Americans step up to our "bargain counter" and bid for our surplus. This is a dangerous weapon to place in their hands, because it is double acting. They have not only come into our market and bought logs under the stress of conditions for less money than ours cost us, but they are then privileged to turn round and compete with us in our own markets with the lumber from these logs, thereby being in a position to underbid us for our own business. This is why they are advertising today for British Columbia logs.

I agree too, that we are placed at some disadvantage in the purchasing of machinery for the equipment of our mills—not a very great item, perhaps, when figured against the year's operation, but still it is an item. Then, too, the class of labor which necessity has driven us to use has no conception of the importance of saving either the

material being manufactured, or the supplies or rigging which they are allowed to use. This is why it costs three times as much to lubricate machinery here as it does in the American mills, as was shown by a writer recently in these columns in a table of comparison. This is a splendid illustration of the disadvantages which we experience in every way by having to use "cheap," uneducated labor.

Lumber interests in British Columbia, instead of having been encouraged, have been ignominously dealt with by our Provincial Government in years past, a fact due, perhaps, to the inability of our legislators to grasp and understand the true status of the industry, or its importance, and they have gone on and helped every other undertaking, feeling secure in their belief that when the surplus in the treasury was dissipated they could levy upon the lumber business which still able to go alone and unaided, and which in their belief, which was based upon prospectuses issued by promoters, was making huge profits. It was not until the treasury was depleted, and they needed more money to help other dependencies that they pricked this bubble. When they found their new levy opposed they ordered an audit of our books, and it was then they found that their conception of our big profits was a myth. Neither has the Dominion Government treated us with any more consideration, as is instanced by harbor regulations and dues imposed in connection therewith; Crown grants for water frontage and what is implied therein in the shape of privileges for lumbermen ("Nothing," says the Exchequer Court); also in the coasting laws, which forbid masters of ships on the east coast navigating the west coast, and vice versa. It is stated that Nova Scotia has business to offer which we cannot reach on this account. Then, too, in the matter of protection, why should we have to pay thirty per cent. duty upon machinery with which to equip our mills, and then have to face the unfair competition of lumber manufactured by American mills being dumped into our market duty free?

The movement which is now on, in which the Governments at Ottawa and Victoria are working in conjunction, gives us renewed hopes (mingled, we admit, with some fears), that whatever may be said of the past concerning this industry following the guiding star of vainglorious superficiality can hardly be said of the future, because while calamity may not be generally recognized as a dispenser of knowledge and education, yet it is likely to act as a deterrent in future, as such a course is not likely to be encouraged much longer by either financial or moral support, and this should bring about a policy of collaboration, with knowledge and wisdom to the fore. Why, I would like to ask, should a man, or men who have not a dollar invested in the business be allowed to run away with our independence, and control our prices as is being done? Is this not a case of the tail wagging the dog? We often hear things said about the large corporations controlling in business, and crowding the smaller ones out, but this does not apply to the shingle or lumber industry, for here it is just the opposite. The large manufacturer goes into the business with a large investment upon a basis of permanency and with thoughts of legitimate profits, and after a time he finds himself surrounded by scores of competitors who have gone into the business in such a small way that they have practically nothing to lose and less to gain. They are not known in the market past the local broker, who has not only made it possible for them to begin, but who also hastens their end. He rustles the business and names the prices, and the manufacturer, who gets no reduction on his saws or anything used in the process of manufacturing, has got to come to his terms and accept his quotation. Such practises as these are what are handicapping our best mills and our best manufacturers today. We have some good mills and some that are not so good, managed by good men—as good and capable as are to be found anywhere, men who know how to conduct legitimate and successful business, but this is what they have to meet. I believe, though, that these last named, whose intentions are of the very best, are suffering from extreme modesty. They are probably ashamed that they are in the lumber business, and perhaps this is why they do not make the fact known, but prefer to remain in seclusion, while the broker before referred to makes the big noise, and attracts the attention of the prospective buyer. Modesty is alright in its place, but it should wear petticoats.

### The Governments' Co-operation

The fact that the governments have now experienced a change of heart concerning our industry, even though that change is born of necessity, shows that they recognize and acknowledge at last the importance of our industry to the well-being of the country, and will probably brush aside the obstacles which have been placed in our way, and thus be able to approach the Australian Government with clean hands. We hope that when Mr. H. R. MacMillan, the Chief Forester of British Columbia, reaches Australia, where it is proposed that he will take up the work started by Sir Geo. E. Foster, he may be able to start something moving, and that some good may be accomplished. It is a long way to Australia, though, by the trail which has been mapped out for Mr. MacMillan, and if it is assumed that this tour is going to meet our requirements, the directors of that policy are undervaluing our necessity. While I look upon the errand upon which Mr. MacMillan has gone as being a very important and necessary one, yet if we rest our case there, I fear that the only thing that will be accomplished will be the spending of that $150,000 voted for this purpose, for while we are going through with formalities, the wily American manufacturers have got their men in the field taking orders.

**Give us the Business,** is the crying need of British Columbia today. It is not so much a question of getting satisfactory prices just now, for no one hopes to realize this until the world settles down again, and transportation finds its level, but from the Government, all down through the trades and professions, as well as from the common laborers, comes the cry **give us business.** The people of this province have reached the stage where they are prepared to meet any condition which will save the situation, which to say the least, is at present deplorable. We want men in those fields where there are prospects of business who are lumbermen, and who know the business and can talk intelligently and convincingly on all topics pertaining to the business, down to the smallest detail, and the man who can do this will get more and better business than a man who may have only a superficial knowledge of the business, and is afraid of leading his customer into detail when necessary, for fear of getting lost himself. Customs and usages, as well as languages and terms of expression will be found very different to ours, and many obstacles, and perhaps even prejudice, will have to be overcome, but let us hope that this will not be approached only by the method of price competition, as is too often the case.

### Should Do Our Own Shipping

It has always seemed strange to me, too, that the lumber manufacturers of British Columbia should be satisfied to go into the Australian and other foreign markets through the agency of their competitors in the United States. What would be our position in a business way, as well as in the eyes of the world, if we had none of our transcontinental railways today, and had to depend upon American-owned and controlled railways to carry our commodities for us? This is exactly our position on the water in so far as the lumber business is concerned, incomprehensible though it may seem. We are actually depending upon people to sell and carry our lumber for us into a market which they want for themselves, and are making every effort to wrest from us. Isn't this extreme innocence? They are in that market working it for all it is worth, and no blame to them, either, and they offer us just enough business from time to time to take the curse off, hoping in this way to keep us satisfied. We know that to establish an entrance of our own which will be satisfactory, and which will meet all the requirements of the case means not only energy, but also a considerable outlay of capital, but to my mind anything short of such an entrance will not meet the needs. I know there are people even in this day of advanced thought, who think that trade will find its natural channel without any effort on their part. **Experience teaches differently,** however. It shows that it will flow just as freely, and sometimes in greater volume through diverted channels when such channels are thrown open. Any man who has had experience in stream driving knows what care is necessary at the diverging point in a stream to protect, or prevent timber from going in the wrong direction, or into what we call "lost channels." It is just as important that our channels of trade be improved and protected if we are to keep our business from running into lost channels.

It is within the bounds of possibility that lumber interests, as has been intimated by an interested and responsible party, will build and operate a line of locally-owned lumber carriers. Notwithstanding anything that may be said to the contrary, this would be the most sensible thing which the lumbermen have yet been accused of doing. British Columbia, with all her vast timber wealth, and with a market upon which she has just claim, and which is within easy reach, lying open to her, should certainly realize her importance and rise to the occasion. It is admitted by some that this is the proper mode of procedure, but, they argue, it will not meet the immediate needs! This is quite true, but as it is manifestly impossible for this project to be entered into at an earlier date than the present, or in time to relieve the present awkward situation, since we cannot turn the wheels of time backwards, it must be remembered that there will be a "present" in one year, or ten years from now just as there is now, and why should we not be prepared for it? Shall we have "a little more sleep?" "A little more slumber?" Some resent this quotation, and say that we are fully awake to our needs, and that we do not require any more light, but we are only now entering into preliminary negotiations in investigations as to how to do what our neighbors have been doing for years before our eyes.

It is obviously a waste of time and money for us to try to reclaim that market, and divert that trade which we have lost back into its natural channel again, while we are depending upon Americans to do this work for us, and therefore, now that the Government is realizing that it is a partner in all our transactions in this respect, and very much interested in the movement of our forest products, it should

if necessary, stand ready to subsidize such an undertaking by responsible parties, as I am sure such an enterprise is just as necessary to the development of the province as some of the undertakings which have received such aid, if not very much more so, because it is obvious that such is the natural route through which much of our trade must flow, and through which much of the revenue for the further development of the province must come. I would go still further than this and say that if necessary the Government should establish and operate a line of lumber carriers for the handling of this trade. I believe that if we were entering these markets by an established route of our own, and were obtaining the business in a business-like way—going in at the front door, instead of at the back door, as at present, we would find no difficulty in financing our shipments, as in time past

### An Australian Preference

If the governments of these two sister colonies can get together and arrange a basis upon which we may be favored with a preference in the tariff, then this makes our entry very much easier, or perhaps turns the barely possible into a hopeful prospect. Of the probability of such an arrangement being made, though, I have my doubts, and I think the reasons why it will not be made are so plain that they need not be given. But while I would like to see such an agreement consumated, I do not think we should throw up our hands in despair if it is not, for I believe that there are many details dealing with imports as well as exports which should be worked out if this trade is to be nurtured. With the trade assured, and transportation and financing facilities properly and satisfactorily arranged, British Columbia will adjust herself to the conditions, and will meet the competition of the American mills. If this were done, and we had our hold, perhaps the proposed preference would come later, even though it might be killed for the present.

The following figures will show the quantities of Pacific Coast lumber shipped to seven of the export markets during 1914, and also our proportion:—

| | | | |
|---|---|---|---|
| Australia | 7,535,111 | 183,216,710 | 190,751,821 |
| Japan | 2,082,327 | 8,535,751 | 10,618,078 |
| China | 1,290,139 | 121,540,939 | 122,831,078 |
| India | 344,631 | 1,614,898 | 1,959,529 |
| New Zealand | 902,289 | 11,309,062 | 12,211,351 |
| South Africa | 9,521,137 | 3,042,214 | 12,563,351 |
| South America | ..... | 85,164,067 | 85,164,067 |
| Total | 21,675,634 | 414,423,641 | 436,099,275 |

The above figures show that British Columbia has got some work to do before she gets her proper share of this trade. It will be noted that we have nothing in South America, chiefly due, I belive, to the difficulty in making satisfactory arrangements for financing shipments to that country. It will also be seen by these figures that we had in 1914 75 per cent. of the South African trade—a fact which makes for a strong argument in favor of a preferential arrangement in the tariff with Australia, such as we have with South Africa.

The following figures show the shipments of fir lumber from this coast to Australia for the past thirteen years, from which it will be seen that our percentage is astoundingly small.

| | | | |
|---|---|---|---|
| 1902 | 20,631,920 | 40,668,373 | 61,300,293 |
| 1903 | 5,155,175 | 74,577,269 | 79,732,444 |
| 1904 | 7,699,076 | 94,384,911 | 102,083,987 |
| 1905 | 13,910,784 | 49,460,945 | 63,371,729 |
| 1906 | 25,241,110 | 82,377,126 | 107,618,236 |
| 1907 | 25,281,057 | 75,652,089 | 100,933,146 |
| 1908 | 12,063,042 | 119,895,764 | 131,958,806 |
| 1909 | 31,389,803 | 55,268,439 | 86,658,242 |
| 1910 | 39,068,228 | 110,101,945 | 149,170,173 |
| 1911 | 28,788,159 | 158,476,721 | 187,264,880 |
| 1912 | 25,406,046 | 172,526,274 | 197,732,320 |
| 1913 | 10,100,036 | 228,673,576 | 238,773,612 |
| 1914 | 7,535,111 | 183,216,710 | 190,751,821 |
| | 252,269,547 | 1,445,080,142 | 1,697,349,689 |

Are we satisfied with these figures? Satisfied with less than 15 per cent. of our own natural market for all those years? Satisfied with less than 4 per cent. of that market for 1914? Satisfied to sell through American agents and ship by American-owned or controlled boats, so that they can divert the business to their own mills at a time when we need it most? Satisfied to leave our mills closed down with heavy fixed charges going on which must be met wholly from the pockets of the stockholders? Satisfied to leave our mill and camp employees in the bread line, and our merchants on the street? Satisfied to let our province go undeveloped for want of the revenue from this business for the sake of our more aggressive friends to the south of us? Satisfied to leave ourselves in the position that our shipping rates can be doubled without our being able to raise our voices in effective protest? These are some of the questions which we are called upon to answer, and who will say that they are not serious enough to demand attention?

I do not advocate reckless competition in our home markets, but when it comes to outside markets which are being supplied almost wholly by Americans is it not better that we have a share of that business even though it will not cover all the fixed charges, or as high a scale of wages as British Columbia mill and woods employees have been used to, than to have conditions as they are today, with our mills closed, and so many of our logs going out of the country to be manufactured, and the fixed charges going entirely out of pocket? It has been shown in these columns before, and will stand showing again that the annual expenditure for labor and supplies alone in the lumber business in this province amounts to the handsome sum of more than $16,000,000 when the mills are all running. Is that not worth thinking about, and even writing about? We each have a share in that, and it is up to each one to do his part to help to solve the problem. The whole community is mightily interested in this matter, whether they know it or not, for that sixteen million dollars is all liquid, as the bank magnates say, and it does not stop with the lumbermen or their employees, but finds its way into the pockets of all and sundry. Living expenses, rents, and values of every kind have tumbled in the past few months, and things generally are fast finding their level. This will enable us to reduce our costs of production considerably, not only at the mills, but also in he logging operations. It is a time of readjustment in everything, and we must conform.

Just what effect this foreign trade, if captured, will have on the mills of the interior, is hard to say, but if it takes away part of the Coast trade it relieves the pressure to that extent in the home market, and even that must help.

Of course, the amount of lumber that these markets to which we have been shipping are likely to use during the next few years is somewhat problematical at this time, as we do not know whether they will be years of expansion or retrenchemnt with them—whether their season of prosperity has passed, or is yet to come. But there is Europe yet to be figured with, and the amount required there is incalculable.

Since writing the foregoing I notice that Sir Richard McBride, in a speech at Ottawa, said that the Government of British Columbia has not the power to subsidize a line of lumber carriers, but thinks that the Dominion Government should do so. This sounds like an admission in our favor. Sir Richard did not make himself clear as to whether the British Columbia Government's lack of power is financial or legal. We know, of course, it is the latter.

## Douglas Fir Opportunities in Cuba

Since the opening of the Panama Canal, exporters on the Pacific Coast have been looking to Cuba with deep concern; especially lumber merchants who are eager to enter the Cuban market taking an advantage of the facilities that this important waterway will offer to the trade.

While Douglas fir lumber is comparatively unknown in Cuba, a leading Cuban merchant, after investigations made from data provided, expresses the opinion that it could be put to the same uses as yellow pine in a considerable number of cases, with the advantage over the latter that boards of greater length could be obtained and as the grain is not very different from that of spruce, it could enter the Cuban market as a strong competitor of yellow pine.

Considering that the annual import into Cuba of yellow pine amounts to more than 100,000,000 feet, it is evident that Cuba would open a valuable market to the lumber industry of British Columbia.

## New Zealand Customs Duty on Wood

The tariff on wood entering New Zealand includes the following:—

| | Quantity | General Tariff | Pref'tl. Tariff |
|---|---|---|---|
| Timber, hewn (square, octagonal or round) | | Free | Free |
| Ash, hickory, and beechwood; shafts, spokes, and felloes in the rough; hubs; poles, unbent and unplaned; bent wheel rims; tool handles; wooden lasts | | Free | Free |
| Palings, split | per 100 | 2s. | 2s. |
| Posts, split | per 100 | 8s. | 8s. |
| Rails, split | per 100 | 4s. | 4s. |
| Shingles and laths | per 1000 | 2s. | 2s. |
| Timber sawn:— | | | |
| Dressed | per 100 s. ft. | 4s. | 4s. |

Note:—The preferential tariff for New Zealand applies to goods of all British countries.

# Rhodes, Curry Company, Limited

## Development of a Great Woodworking Industry with Extensive Export Trade

A. S. Curry, General Manager.

C. D. Dennis, Sec'y-Treas.

Virgin Hardwood.

Virgin Spruce.

Prominent among the great manufacturing and exporting firms of Eastern Canada is the widely-known Rhodes, Curry Company, Limited, of Amherst, N.S., whose operations have extended over a period of 38 years. Rhodes, Curry Company, Limited, was established in the year 1877. The late Mr. N. A. Rhodes, father of Mr. E. N. Rhodes, M.P., Member for Cumberland, and Mr. N. Curry, now Senator, were its founders, establishing a woodworking business in Amherst, N.S., in the summer of 1877. They continued to do a building and contracting business until the year 1893, when they absorbed the Harris Car Company of St. John, N.B., and moved it to Amherst. The combined business was operated under the name of Rhodes, Curry & Company, both as a woodworking plant and car works. Subsequently, in the year 1909, this company was merged with the Canadian Car & Foundry, Limited, of Montreal, one of the largest concerns of its kind in the Dominion of Canada.

The woodworking and contracting business is still managed under the name of Rhodes, Curry Company, Limited. The main plant is situated at Amherst, N.S., the busy hub of the Maritime Provinces; the central location of which, with rail and water facilities at its doors, is extremely advantageous for the collection of raw material and distribution of its products. In addition to the plant at Amherst, this company operates branches at Halifax, Sydney and New Glasgow, besides being owners and operators of saw mills at Athol, Wentworth, Londonderry, Mapleton and Antigonish. The products comprise building materials of every description, also church, school, bank and office furniture. The company have extended the market for this portion of their business as far as the interior of South Africa.

The company also acts as contractors for, and builders of, private and public buildings. The first contract entered into by this company was for the erection of Acadia College and Seminary Buildings at Wolfville, N.S., in the year 1878. These buildings are still standing today. The company have built, during the interim, many of the notable banks and public buildings in the Maritime Provinces, and are completing this year a handsome new Post office building for the city of St. John, New Brunswick.

As a feeder to its factories and yards, the company carry on large lumber operations yearly, being owners of very extensive spruce and hardwood timber tracts throughout Cumberland, Colchester and Antigonish counties. Thus they are able to furnish materials from the virgin forest to the home.

The flooring and sheathing manufactured from these natural woods produced from the company's limits, are unexcelled. Within the last year the woodworking factory at Amherst was extended over four hundred feet; new machinery installed; new dry kilns built with kiln capacity of six million feet per annum; additional sidings laid; steam-heated warehouses erected to take care of all finished product, and every convenience made for the handling of their increased output.

### A Live Firm of Hardwood Exporters

The advertisement on page 7 gives an outline of the business carried on by Robert Bury & Company, large exporters to Europe of Canadian and United States hardwoods. For many years this firm has been introducing Canadian hardwoods to British manufacturers. The English company, known as Robert Bury Company, England, Limited, whose office is at Bootle, Liverpool, has been established for twenty-two years. The managing director and chief shareholder is Mr. Robert Bury. Eighteen months ago the company was incor-

Rhodes, Curry Company, Limited—the plant as it appears to-day.

Rhodes, Curry Company, Limited—the plant as it appeared in 1877.

porated, and as the business was in a very flourishing condition Mr. Robert Bury decided not to allow shares to be held by any but working members of the firm, and he took into partnership Messrs. F. M. Thompson and R. Buchan, of the Toronto branch, who hold the balance of the shares of the company.

The Canadian office, known as Robert Bury & Company, 79 Spadina Avenue, Toronto, has its yard and sidings on the bay front. The business is operated as a private company partnership between Robert Bury, F. M. Thompson and R. Buchan. The Toronto business is an increasing one, and conducts all the Canadian and United States buying and shipping for the English office. It has also an extensive local connection, supplying all grades of hardwood to the important local and United States markets.

On account of the great increase in the company's business they have found it necessary to extend their yard space at Toronto by taking an additional siding and by extending the length of their original siding so as to lay down a sawmill plant. The chief object in installing this plant has been to keep up with the English demand for piano action white maple manufactured to dimension stock in quartered and plain sawn, for a trade which was held previously to a great extent by German piano action makers. In addition to turning out this special work the company have installed machinery to manufacture piano rails, flooring strips and bobbin wood. They buy and ship large quantities of these goods from mills all over Ontario, and with their new equipment are in a position to execute rush orders and orders for special sizes from their own plant.

A varied stock of half a million feet is carried in the Toronto yards, and the company have on hand at country points a similar quantity always ready for immediate shipment. The firm employ two Ontario inspectors, one Quebec and New Brunswick inspector and one resident New York inspector. These men are thoroughly experienced in their work and enable Robert Bury & Company to guarantee their customers high class grades.

## Metrical Lengths for France and Belgium

Orders from France and Belgium usually call for lengths of lumber to be cut to what is termed metrical feet. The required length is equivalent to 13⅛ inches. The thickness and width correspond to English measure.

To convert metrical to English lengths, multiply by 35 and divide by 32, or to the metrical feet add one-twelfth and one-eighth of one-twelfth. In bringing metrical to English lengths, the use of decimals will be an advantage. How many feet, board measure, are contained in the following items of 3 x 9 cut to metrical feet?

| Pcs. | Size. | Met. Ft. | Extension | |
|---|---|---|---|---|
| 60 | 3 x 9 | 12 | 720 | |
| 114 | 3 x 9 | 14 | 1,596 | |
| 112 | 3 x 9 | 16 | 1,792 | |
| 40 | 3 x 9 | 18 | 720 | |
| 60 | 3 x 9 | 20 | 1,200 | |
| 386 | | | 6,028 | Met. Lin. Ft. |
| | | | 502.33 | |
| | | | 62.79 | |
| | | | 6,593.12 | Eng. Lin. Ft. |
| | | | 2¼ | |
| | | | 13,186.24 | |
| | | | 1,648.28 | |
| | | | 14,834.52 | Ft. B. M. |

The addition of the extensions shows the number of metrical lin. feet, the line below shows that amount divided by 12, and this in turn is divided by 8.

The total thus obtained shows the English lineal feet. This is brought to board measure in the usual way by multiplying by 2¼.

## The Canadian Intelligence Service and Its Chief

Mr. R. Grigg, Commissioner of Commerce.

One of the most valuable aids in connection with the development of Canadian export trade is the work carried on by the Canadian Commerce Intelligence Service. A review of the work of the Service was recently published by Mr. R. Grigg, Commissioner of Commerce, which gives an excellent idea of its importance. In his introduction to the review Mr. Grigg outlines the extent of the service at present in existence, which includes 24 officers, serving abroad, of whom 18 are trade commissioners, stationed in the Argentine Republic, Australia, British West Indies, China, Cuba, France, Germany, Japan, Holland, Newfoundland, New Zealand, South Africa, and the United Kingdom, and six are commercial agents stationed in the British West Indies, Colombia, Norway and South Africa. In accordance with an arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, a large number of British Consols were also placed at the disposal of Canadians, who may wish to consult them in reference to trade matters. Valuable reports are continually received from these officers describing in detail the opportunities for increasing Canada's export trade in various lines. These reports are of an eminently practical nature, giving, in the great majority of cases, actual facts and figures in connection with the subject under discussion.

It is impossible to deal adequately with the value of this service in a brief reference. It would be advisable for Canadian lumbermen who are studying the export trade to get in touch with Mr. Grigg and request him to place their names upon the mailing list for the Weekly Trade & Commerce Reports. These reports contain the important reports received from the trade commissioners in foreign countries and, being published weekly, are thoroughly up-to-date. Our readers will also be well advised if they secure a copy of the annual review of the work of the Canadian Commercial Intelligence Service, referred to above.

The appointment of Mr. R. Grigg, as Commissioner of Commerce, was one which has proved to be exceptionally happy. Mr. Grigg's natural abilties are exactly suited for the handling of so important a work. Incidentally we wish to acknowledge that a great deal of the information contained in this issue of the Canada Lumberman comes from the reports of Mr. Grigg's department.

Mr. Grigg spent his early life on a farm in Ontario and later had a successful career as a manufacturer in Great Britain. During that period he was active in the press and on the platform as a mission-

Hauling to the mill—Rhodes, Curry Company, Limited, Amherst, N.S.

Ready for export or domestic market—Church furniture produced by Rhodes, Curry Company, Limited.

ary for the gospel of a great Canadian future, and the urgent need for a better understanding of that fact in the Mother country.

On retiring from business in 1905 he accepted a commission from the Imperial Government to visit Canada and report upon the economic condition of the country, having special regard to British trade. The report upon his visit attracted world-wide attention and probably enjoyed a larger circulation than any other blue book ever published. Nearly every British paper throughout the Empire dealt with it both by leaders and extracts, and long extracts were translated and appeared in foreign journals. It was stated in the Canadian press at the time that no single influence had so important a share in attracting favorable attentiona to Canada, with the resulting effect upon the money market and emigration, as this report.

In 1907 the British Government decided to appoint an officer as head of the British Commercial Intelligence Service in Canada. The appointment was offered to Mr. Grigg, and after four years' activty with headquarters in Montreal, the Canadian Government sought his services and he accepted the positon of Commissioner of Commerce with the rank of Deputy Minister. The result of his three years' work under Sir George Foster is apparent to all who avail themselves of the services of his Department as an aid to business. The Weekly Report has doubled in size and more than doubled in circulation during the last two years. Reorganization of a Department is a slow and difficult business but the energy and ability of Sir George Foster is laying the foundation of invaluable work for the Dominion. He has raised his Department from the positon of having been the most insignificant and least effective of the Government Agencies to the very front rank, and given it the authority it should command in a country of vast natural resources and destined to be a great manufacturing and exporting country.

What is being done in this Department recalls the transformation effected by Mr. Joseph Chamberlain when he chose to represent the Colonial office in London—at that time an insignificant Department. By the application of his commanding ability and energy he raised it to the position of one of the most important British Government Agencies.

Mr. Grigg has the warm appreciation and unstinted regard of every member of the community who has been brought into contact with his work.

# Reciprocity with Australia Required

## Would Put B. C. Logging Camps and Mills in Operation and Establish Export Trade on Sound Basis

That with reciprocal treaties with the Commonwealth and better facilities for shipping, the lumber industry would be enabled to recommence its activities in British Columbia, was the substance of an interesting paper read at a recent meeting of the Victoria Board of Trade, by Mr. E. J. Palmer, managing director of the Victoria Lumber & Manufacturing Company, Limited, Chemainus.

"The price of lumber in foreign countries," said Mr. Palmer, "is dominated by the ship brokers of San Francisco. As an example: Mr. Niel Nielsen, Trade Commissioner for Australia, was here recently, prepared to place orders for lumber for his government, and the freight quotations were advanced from 55s. to 90s. in seventy-two hours, or $8.40 per M. Mr. Nielsen made the statement to me that, after his experience in securing tonnage he was prepared to state to his government that he thought giving Canada a preferential duty would be a good thing for Australia, and would not cost the consumer one cent more (and he thought less). The amount of lumber shipped from the Pacific Coast to Australia in the last ten years has increased 390 per cent., while the amount furnished by British Columbia mills has steadily decreased from 36 per cent. ten years ago to 3.7 per cent. in 1914. Whereas our trade with South Africa has increased from 17 per cent. to 64 per cent. since they have given us a preference of 2s. per M.

Combined shipments to all parts of the world by water for British Columbia, Washington, and Oregon for 1914, reached approximately 700,000,000. Of this 700,000,000, 52½ per cent. went to Australia, New Zealand, United Kingdom, and South Africa, while 20 per cent. went to South America, and 21½ per cent. to the Hawaiian Islands and the Philippines and miscellaneous points; so that over one-half of the export trade went to the British possessions. Had we received but one-half of the Australian business (practically 200,000,000), it is unnecessary to say what this would have meant to the province, both in the employment of labor and the revenue to the government.

The price of lumber to the consumer is controlled by the ship brokers, and is simply a matter of manipulation of freight.

While the Allie Line was subsidized by the government, we enjoyed fully 70 per cent. of the business, while now I do not think we have over one per cent. of it.

### Co-operation Necessary

No doubt the question will be asked, "Why is it that the lumbermen have not exploited their product, and why our friends south of us enjoy so much greater a share of this trade than British Columbia?" In explanation, I would say: It would be impossible for any individual lumber manufacturer to exploit our foreign trade owing to the expense. The only way this can be done is by co-operation, or with the assistance of the government. The United States government, after their great hue and cry that there was a lumber combine, started investigations, the results of which were that their auditors, after auditing all the principal mills on the Pacific Coast, made a statement that lumber could not be produced at less than from $15 to $15.50 per M., pay 6 per cent. on the investment and allow for stumpage what the government charges for its stumpage. They then passed an appropriation, and, I think detailed some four or five men from the Department of Trade and Commerce to assist the lumbermen in exploiting their product and helped them to secure business.

The export lumber trade of the Pacific Coast commenced first in San Francisco, and it has been so long established there that it is difficult to divert it. The carrying trade is, to a large extent, in the hands of Pacific owned vessels, and their facilities for securing return cargoes enables them to time charter. For instance, I know of one firm that have three steamers under long time charter which will enable them to lay down lumber in Australia at from 27s. to 30s., against 90s. asked today; so you can see that the price of lumber cuts but little figure.

The provincial government has done everything in its power to urge reciprocity. Should we get reciprocity with Australia, it will mean the starting of all of our logging camps and every mill that can ship foreign. In making this statement, I am assuming that Australia will take as much this year as in 1914, but I hardly think this is possible owing to drought and war conditions, but this will be augmented, to a great extent, by the extra amount the government will require for its own uses in building a new city which they purpose to build.

### Use of Interned Vessels

There is another thing that will relieve the situation greatly. I understand there are some twenty-one German vessels that have been condemned in Australia. Mr. Nielsen cabled his government, while here, suggesting that enough of them be put in commission, with Australian crews, to transport material required by the government. If the Imperial government could be induced to put the balance of them in commission it would relieve the situation greatly, as there are orders for fully 50,000,000 of timbers for United Kingdom now on the market of the Pacific Coast, so anything that can be done to forward this would be of great assistance to the industry.

### Rail Business in Canada

The rail business for 1915 at the present time is anything but encouraging, and estimated volume of business for the Northwest Prairie provinces will not exceed 35 to 40 per cent. of the lumber movement to these prairie provinces the past five years. The country points should do a fair volume of business, although this will not be determined until July 1, at which time crop conditions will be the governing factor. We cannot expect any revival of building operations in the large cities on the prairies for several years until the country back of the cities has developed sufficiently to support the cities. Prices for lumber are at the lowest level in years, and should the manufacturer be able to secure full list price for his product delivered on the prairies at 40c. rate of freight (which is the minimum freight rate to his nearest market), he would not obtain an average price high enough to cover his cost of operations. The average cost of delivery to the prairies is $10 per M. The average net f.o.b. mill price for 1914 was $12.65 per M., making an average gross price received $22.65 delivered on 40c. freight rate. It cost the average Coast mill $15.50 per M. to produce their product and load on cars at the mill. Add to this the average freight of $10 per M. on the prairies and you have a gross delivered cost of $25.50 per M., showing a net loss to the producer of $2.85 per M.

Some of you present may ask why we do not increase the price of our product to at least cover the cost of production, and in answer to this I will say, the manufacturers on the American side have invaded our Canadian market to such an extent with low prices that we must either meet their prices or cease to operate. There is but one explanation to this, and that is the American mills are able to produce for less than the Canadian mills. I have before me statements of the cost of manufacturing lumber of twenty mills in Washington and Oregon, compiled from the books of these mills by a most able, certified public accountant, showing the average cost of manufacture exclusive of the cost of logs of $6.44 per M., as against our average cost of manufacture of $7.42 per M., making a difference in cost of manufacture of American mills and Canadian mills 98c. per M. Add to this the difference in the logging cost on this side of the line and the American side of the line, and you have the answer as to why we cannot advance our prices to cover the cost of our product.

Taking into account the topography of the country to be logged in the United States, together with the low cost of supplies and mach-

inery, the United States mills have a decided advantage in their favor in cost of production.

The 7½ per cent. duty recently established on all rough timber entering Canada from the United States gives Canadian lumber manufacturers very little relief from American competition, as the mills on the other side take a mill base price of $7.50 per M. from which to figure this duty. This base price is too low, and should not be less than $10 per M. mill base, which would give the Canadian manufacturers protection of 75c. per M. on all rough lumber entering Canada from the United States. This latter figure is much lower than the government figures as compiled by their committee only a year ago, showing the average cost of production to the manufacturer of $15.50 per M., and, in justice to the Canadian mills, this latter figure should form the basis from which to compute the new duty of 7½ per cent. on rough lumber.

## Australia Customs Duty on Wood

The tariff on wood entering Australia include the following:—

| | Quantity | Pref'tial. | General |
|---|---|---|---|
| Timber, viz:— | | | |
| Engravers' boxwood and engravers' maple-wood | .... | 5% | 5% |
| Hickory, undressed | .... | 5% | 5% |
| Logs, not sawn | .... | 5% | 5% |
| Spars, in the rough | .... | 5% | 5% |
| Timber, undressed, n.e.i. in sizes of 12 in. by 6 in. (or its equivalent) and over | per 100 sup. ft. | 1s. | 1s. |
| Timber, undressed, n.e.i. in sizes of 7 by 2½ in. (or its equivalent) and upwards, and less than 12 in. by 6 in. (or its equivalent.) | per 100 sup. ft. | 3s. | 3s. |
| Timber, undressed, n.e.i. in sizes less than 7 in. by 2½ in. (or its equivalent) | per 100 sup. ft. | 3s. 6d. | 3s. 6d. |
| Timber, undressed, cut to size for making boxes | per 100 sup. ft. | 5s. | 5s. |
| Timber for making boxes being cut into shape, and dressed or partly dressed | per 100 sup. ft. | 6s. | 6s. |
| Timber, bent or cut into shape, dressed or partly dressed n.e.i. | .... | 30% | 30% |
| Timber, dressed, n.e.i. | per 100 sup. ft. | 4s. | 4s. |
| Veneer, three-ply | per 100 sup. ft. | 7s. 6d. | 7s. 6d. |
| Veneers, n.e.i. | per 100 sup. ft. | 5s. | 5s. |
| Timber, viz:— | | | |
| Laths for blinds | .... | 30% | 30% |
| Laths, n.e.i. | per 1000 | 10s. | 10s. |
| Palings | per 1000 | 15s. | 15s. |
| Pickets, undressed | per 100 | 3s. 6d. | 3s. 6d. |
| Pickets, dressed | per 100 | 7s. | 7s. |
| Shingles | per 1000 | 5s. | 5s. |
| Architraves, mouldings, n.e.i., and skirtings, of any material | per 100 lin. ft. | 6s. | 6s. |
| Picture and room mouldings | .... | 30% | 35% |
| Timber, undressed, in sizes less than 7 ft. 6 in. by 10 in. by 2½ in. for door stocks | per 100 sup. ft. | 3s. | 3s. |
| Timber, for making doors being cut into shape, and dressed or partly dressed. | per 100 sup. ft. | 6s. | 6s. |
| Doors of wood, including fly doors— | | | |
| Sizes 1½ in. and under | each | 4s. 6d. | 4s. 6d. |
| Sizes over 1½ in. and under 1¾ in. | each | 6s. | 6s. |
| Sizes 1¾ in. and over | each | 8s. 6d. | 8s. 6d. |
| Staves, undressed | per 100 | 1s. | 1s. |
| Staves, dressed, or partly dressed, but not shaped | per 100 | 4s. | 4s. |

On shooks of various kinds there is a general duty ranging from 4s. 6d. to 13s. and a preferential duty for goods from Great Britain, the duty being in most cases 6d. less than under the general tariff. The duty on many lines of manufactured products is also specified in detail. The list would be much too lengthy to publish in our limited space. We will be pleased, however, to furnish any of our readers with definite information regarding any items in which they are interested.

**Box and Barrel Stock for Ceylon—Douglas Fir:**—Ceylon imports box and barrel shooks and crating which are free of duty provided they are certified at the time of export to be used for shipping Ceylon products. The only woods dutiable are finished pieces used in floorings and otherwise, which pay 5½ per cent. duty. The imports are practically all from Japan and the United Kingdom. In 1913 they were valued as follows: Japan, $500,000, United Kingdom, $400,000. Tea chests used in Ceylon are in two sizes. The full chests measure 24 in. x 19 in. x 19 in., and half chests 17 in. x 17 in. x 17 in. The full sized chests are purchased for about 26 cents, Canadian currency, c.i.f. Ceylon, and half chests for about 20 cents. The usual thickness of the wood is ½ inch. It has been suggested in Ceylon that Douglas fir could be used for vegetable-oil barrels. Box and barrel shooks are imported particularly by consumers, and to a less extent through brokers or merchants. Importers of Burma wood are granted thirty days sight. On shipments from Europe and America the usual terms cover a period of ninety days. Practically all goods imported go through the port of Ceylon. Goods from the Pacific Coast are frequently trans-shipped at Hong Kong. Shooks of all kinds are badly needed in Ceylon, but it is difficult to satisfy local merchants that such a wood as Douglas fir would be suitable. The wood must be insect proof and odorless.

# Export Trade in Hardwood Flooring

### Free Admission into the United States Assisting Our Industry—History of U. S. Tariff Changes

When, in 1913, the United States reduced the tariff on lumber, there were some lumbermen who were doubtful as to whether it would have any appreciable effect upon the volume of Canadian exports. Experience has shown that, in respect to hardwood flooring, the abolition of the duty of $2.37½ per 1,000 feet has increased our sales in the American market. The history of the placing of hardwood flooring on the free list is interesting, and the position of the wood in that category may perhaps be regarded as being unintentional. When the schedules were issued it was found that hardwood flooring was omitted from Paragraph 647 providing for the admission of certain classes of lumber free, and also from Paragraph 176, which imposed a 15 per cent. duty on certain descriptions of manufactured lumber.

In these circumstances, the United States Deputy Collectors of Customs put hardwood flooring under paragraph 176, the result being that the duty, instead of being lowered, was considerably raised—in some instances more than trebled. The Seaman, Kent Company, Limited, of Meaford, Ont., Fort William, Ont., and Montreal, Que., promptly got into communication with the authorities at New York, Boston and Washington, and Mr. Kent and Mr. J. A. Bernard, the Montreal manager, visited these points and put their case before the authorities. The case they presented was very simple—it was that the Act was intended to reduce the duties, whereas the effect of putting hardwood flooring under Paragraph 176 was to enormously increase them. The contention of the Customs authorities was that hardwood flooring without being specifically mentioned came within the definition of Paragraph 176, objection being taken to the ploughing, and matching, boring, and dressing on the back (being in fact further manufactured than planed, tongued and grooved), these constituting, it was argued, processes of manufacture which rendered hardwood flooring liable to the duty of 15 per cent. The answer to this was that if the flooring was hollow-backed and bored, it was manufactured for no further purpose than planed, tongued and grooved lumber. The boring and the hollow-backing was done to satisfy a caprice of the public, and was not a real necessity. The boring was practically never used, as the hollow-back answered only as reducing the weight of the flooring for freight and to enable to distinguish more easily the face from the back.

Considerable correspondence took place, and as a result the following decision was come to. It was contained in a letter from the Treasury Department, Washington, addressed to the Collector of Customs, Ogdensburg, N.Y.:—

### Outline or the Tariff Situation

"The Department duly received your letters of the 7th and 9th ultimo relative to the proper classification of the lumber described in the list enclosed in your last mentioned communication, consisting of pieces of novelty siding, stair rails, base molding, sash rail, sash mortice, etc., samples of which lumber you forwarded under separate cover. As paragraph 647 provides for the free entry of sawed boards, plank, deals, and other lumber not further manufactured than sawed, planed, tongued and grooved, you inquire whether any of the samples submitted represent lumber further advanced than planed, tongued and grooved. The Board, in Abs. 13267 (T. D. 27685), held that certain so-called novelty siding which has been so shaped that one board overlapped the other, was not subject to additional duty provided in paragraph 195 of the tariff Act 1897 for tonguing and grooving. In a later decision G. A. 5441 (T. D. 24719) the Board had before it for decision the proper classification of pieces of board ⅛ inch in thickness, and varying in width from 4 to 10 inches, and in length from 26 to 39 inches, the boards having been printed to represent cedar.

"The boards were assessed with duty as manufactures of wood under paragraph 208 of the Tariff Act of 1897. The Board held that the operation of printing did not constitute a manufacture of wood, for the reason that the boards had not been given a new name, character or use, but still remained wood, and as there was not provision for the importers that the wood was dutiable as sawed lumber under paragraph 195 of the said Act.

"The United States Circuit Court of Appeals for the second Circuit in T. D. 27385 affirmed that the decision of the Board of U. S. General Appraisers that ordinary sawed lumber which had been subject to the fireproofing process which greatly increased its value, was not, by reason of the process, removed from the provision in paragraph 195 of the Tariff Act 1897 for sawed lumber.

"It will be noted, from the decision cited, that lumber may be advanced in value and conditions beyond that of lumber, planed, sawed, tongued and grooved, and yet not be a manufacture of wood.

"While it is difficult to establish a well defined line of demarcation between lumber that is dutiable as manufactures of wood under paragraph 176 of the Tariff Act, and lumber which falls within the

provisions of paragraph 647 of the said Act, the Department is of the opinion, in view of the decisions cited, and giving due consideration to the purpose of the present Tariff Act, which is to reduce duties, that flooring, although in addition to being planed and tongued and grooved, is ploughed on the under side to ensure a perfect fit to the board as flooring, is not excluded from the classification under paragraph 647. The Department is also of the opinion that the ordinary novelty siding, ordinary window parting strips, outside baseboards, ordinary siding, and other articles which are not molded or beaded, are entitled to admission free of duty under paragraph 647.

"Articles such as sash rail, stair rail, crown molding, signboard molding, and similar articles, when beaded or molded, are, in the opinion of the Department, properly dutiable as manufactures of wood at the rate of 15 per centum ad volorem under paragraph 176 of the Tariff Act."

Prior to the tariff revision of 1913 Canadian manufacturers had been sending a fair quantity of hardwood flooring into the Eastern States, being able to compete, in times of good trade, owing to the favorable railway rates due to the geographical position of our mills. The great bulk of the American hardwood flooring comes from Michigan, and the long railway haul to the Eastern States was a handicap when competing with Canadian mills. The imposition of the 15 per cent. duty would have more than counterbalanced any advantage we held owing to close proximity to markets, and would, in fact, have killed our export business. The placing on the free list, on the other hand, is a decided advantage, and has tended to increase the trade.

There are a few mills in the Eastern States manufacturing hardwood flooring. These buy considerable quantities of lumber in Canada, and of course are able to import it free of duty. But in face of this, Canadian firms are able to compete successfully. The demand from over the border is not as brisk as it was, say a year ago. It is, however, still fairly good, the placing on the free list helping our exports.

## South Africa Market—What It Requires

The importance of the lumber trade of South Africa will be recognized when it is stated that in 1913, by no means the largest year of import, 187½ millions of feet B.M. were imported into the country, of which almost 115 million feet was pine; and 47½ million feet consisted of flooring and ceiling boards, manufactured for the most part out of the same raw material. The first thing that strikes one is the low grade of the importations, the great bulk being common, which is brought in for the most part as deals, boards, flooring and ceiling. By common is meant the grade known as such on the Pacific Coast; or lumber which has knots which are sound, but which is otherwise of good quality. The difference between one grade and another being that in some cases there are not quite so many knots or they are a little smaller, or that the material is a little better manufactured. Of the great bulk of lumber imported which is pine, practically all of it is common.

### Imports From Canada

As regards the trade from Canada, apart from comparatively small consignments, it is made up for the most part of cargoes per sailing ship from Vancouver or Vancouver Island ports. This timber is mostly for the South African Government railways, and consists of baulks running from 12 x 12 to 18 x 18, and deals 3 x 9 and 4 x 12. The railways also require from time to time consignments of clear pine, averaging about 200,000 feet a year; and they also buy shelving grade. There has been forwarded to the Department of Trade and Commerce, Ottawa, a specimen Tender Form, together with the conditions of timber contracts, which will be of service to those who may wish to enter the trade and deal direct with the Government.

There is no doubt that there is a large market in South Africa for Canadian lumber, and the Baltic is the competitive trade with which Canada must reckon. The sizes, which are based on 3 x 9 planks, are what the whole of the building trade is accustomed to and the architects specify. Provision should be made also for the smaller buyers to be able to get the quantities they want.

### Grades of Lumber Required

In deals, boards, and dimension lumber generally there is only one grade, common and often worse. The same applies to ceiling and skirting, which are nearly all OG in pattern. Bull nose and other casing are unknown, the simple non-dust-collecting lumber for interior finish not having been introduced. Flooring is also worse than No. 2 flooring as understood on the Pacific Coast. It is ordinary common lumber, grooved and tongued. The town hall at Durban, which cost over a million and a half dollars, is floored with material full of small knots, and the same fault applies to the best of Baltic flooring, the knots being often not even sound. There is little sentiment in business here, but if Canada can give a better article for the same price than can be had now, there is a large market. There will, however, be competition here from firms which are bound up to a certain extent with Swedish mills. People will need to know that Canadian lumber is better, can be procured as required, and that there will be regular sailings on which they can depend. From the east coast there is already a monthly service, but from the west coast there comes a full cargo only three or maybe four times a year.

## South Africa Customs Duty on Wood

The tariff on wood entering South Africa includes the following:—

| | General Tariff | Pref'tl. Tariff |
|---|---|---|
| Wood unmanufactured:—Ceiling and flooring boards, planed, tongued and grooved; materials for use in construction of telegraph and telephone lines; posts, gates, hurdles, and other materials ordinarily used for agricultural or railway fencing; railway or tramway sleepers; saddle trees; hubs, rims, spokes, felloes, shafts, tent-bows and poles, cut or fashioned, not finished, except when for wagons and carts | 3% | Free |
| Finished parts of carriages, carts, coaches and wagons | 25% | 22% |
| Cooperage, viz:—staves in the rough and vats for the manufacture of wine | Free | Free |
| Wood and timber not included in any other item. | 20% | 17% |

Note:—The preferential tariff for South Africa applies to goods of all British Countries.

## A Sample South African Box Shook Enquiry

**Box Shooks.**—The Canadian Trade Commissioner at Cape Town, South Africa, reports an enquiry for box shooks, of which 100,000 sets are wanted. The first lot of 50,000 sets is to be made up as follows:—

| | | | |
|---|---|---|---|
| Lot 1—Sides | 2 Pieces | 15½" x 5¼" x 5/16" |
| Ends | 2 Pieces | 9" x 5¼" x ⅝" |
| Tops and Bottoms | 2 Pieces | 15½" x 5¼" x 5/16" |
| Lot 2—Sides | 2 Pieces | 15½" x 6¼" x 5/16" |
| Ends | 2 Pieces | 9" x 6¼" x ⅝" |
| Tops and Bottoms | 2 Pieces | 15½" x 9⅝" x 5/16" |
| Lot 3—Sides | 2 Pieces | 15½" x 8" x 5/16" |
| Ends | 2 Pieces | 9" x 8" x ⅝" |
| Tops and Bottoms | 2 Pieces | 15½" x 9⅝" x 5/16" |
| Lot 4—Sides | 2 Pieces | 11½" x 4 9/16" x ¼" |
| Ends | 2 Pieces | 9¼" x 4 9/16" x ½" |
| Tops and Bottoms | 2 Pieces | 11½" x 6⅝" x ¼" |

These are about equally divided in quantity and the delivery should be regular throughout the year.

The second lot are in the following sizes:—

| | | |
|---|---|---|
| Lot 1a—Sides | 2 Pieces | 11" x 3½" x 3/16" |
| Ends | 2 Pieces | 5" x 3½" x ½" |
| Tops and Bottoms | 2 Pieces | 11" x 5¼" x 3/16" |
| Lot 2a—Sides | 2 Pieces | 11½" x 5" x ¼" |
| Ends | 2 Pieces | 6¼" x 5" x ½" |
| Tops and Bottoms | 2 Pieces | 11½" x 6½" x ¼" |
| Lot 3a—Sides | 2 Pieces | 15½" x 5¾" x ¼" |
| Ends | 2 Pieces | 9" x 5¾" x ⅝" |
| Tops and Bottoms | 2 Pieces | 15½" x 9½" x ¼" |

Delivery to be in September, 1915, and while the present demand is for 50,000 sets only, if the price is right the possibilities are for not less than 500,000 sets.

It will be noted that the demand is not for clear white pine; shooks made from the same wood as is used in the shipment of spruce deals to South Africa will be satisfactory. Prices should be quoted c.i.f. Cape Town.

---

New York uses over 470,000,000 board feet of wood for boxes and crating alone. This is equivalent to about three-fifths of the total amount of lumber cut in the State. Over 1,850,000,000 board feet of wood are used in New York every year.

---

During 1913 Belgium imported timber to the value of $24,065,120 and exports to the value of $791,108. In these totals the imports include timber to the value of $11,194 from Canada and the exports include timber to the value of $8,106 sent to Canada.

---

During 1912 Norway imported timber to the value of $3,256,066 and exported timber to the value of $8,646,350. Canada does not figure in this trade at all.

---

The Northern Hemlock and Hardwood Manufacturers' Association, which formerly had its head office at Wausau, Wis., has moved to Oshkosh, Wis.

---

During 1911 Sweden exported timber to the value of $44,858,832 and imported timber to the value of $3,543,603. Canada does not figure in this trade.

---

During the year 1913 France imported timber to the value of $41,470,276, Canada's share of which was $72,375.

## France Customs Duty on Wood

The tariff on wood entering France includes the following:—

| | Quantity Kilogs | General Tariff Francs | Treaty Tariff Francs |
|---|---|---|---|
| Logs, rough, not squared, any length not exceeding 60 centimetres in diameter at the thick- | | | |
| Wood, sawn or squared, 80 millimetres in thickest end | 100 | 1 | .65 |
| ness and above | 100 | 1.5 | 1 |
| Wood, squared or sawn, exceeding 35 millimetres but less than 80 millimetres in thickness | 100 | 1.75 | 1.25 |
| Wood, sawn 35 millimetres in thickness or less. | 100 | 2.5 | 1.75 |
| Paving blocks | 100 | 2.5 | 1.75 |
| Stave wood | 100 | 1.25 | .75 |
| Splints | 100 | 2 | 1.5 |
| Hoop wood and prepared poles | 100 | 2.5 | 1.75 |
| Perches, poles and staffs, rough, exceeding 1 metre 10 centimetres in length, and of a maximum circumference of 60 centimetres at the thickest end | 100 | .45 | .3 |
| Woods, saturated, or having undergone any form of chemical preparation. | | | |
| The duties on all saturated woods, or on those which have undergone any form of chemical preparation, shall be increased by 20 per cent. (This increase shall not apply to the surtaxes of origin or for warehousing). | | | |
| Wood, planed, grooved, and (or) tongued, planks, strips, or veneers for flooring, planed, grooved, and (or) tongued: | | | |
| Of oak or hardwood | 100 | 7.5 | 5 |
| Of firwood or softwood | 100 | 5.25 | 3.5 |
| Doors, windows, Venetian blinds, Venetian shutters, roll shutters, roller blinds, wood panelling, and joiners' wares, put together or not: | | | |
| Of hardwood, including articles made partly of hard and partly of softwood | 100 | 30 | 20 |
| Of softwood | 100 | 19 | 12.5 |
| Painted, varnished or lacquered of a uniform color | 100 | 45 | 30 |
| Carved or ornamental in relief or hollow carved, gilt or decorated with designs imitating the grain of wood or with other designs | 100 | 75 | 50 |

The duty on many lines of manufactured products is also specified in detail. The list would be much too lengthy to publish in our limited space. We will be pleased, however, to furnish any of our readers with definite information regarding any items in which they are interested.

Note:—The franc = 19.3c. The treaty rates quoted apply to Canadian goods.

## Creosoted Blocks—A Promising Export Trade

One of the lines of lumber products for which there is a very promising future in the export trade, as well as in the domestic trade, is that of wood blocks for pavement purposes. Creosoted wood blocks laid under modern conditions are superior in wearing qualities to macadam, brick, asphalt, granite or sandstone. As far back as 1901 the Metropolitan Street Railway Company of New York City made an experiment with creosoted wooden blocks for pavement between its tracks. A small area was laid, the wood being flanked at either end with granite, the material formerly used. The wood selected was long leaf yellow pine. There was a heavy truck traffic at the place where the experiment was made. At the part of the road where the trucks run with one wheel just outside the car rail the stresses on the pavement were very great and the granite showed a rut in six months, requiring renewal almost annually. At the end of four years, the wood, although showing a heavy rut, was still sound in position and good for at least one more year. The granite on either side had been renewed three times during the four years. The facts of this experiment are reported in United States Forest Circular No. 141.

# WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## Wanted–Lumber

### Wanted to Buy

Inch Cedar suitable for boats. Box 184, Canada Lumberman, Toronto. 9-12

### Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

### Wanted

Three hundred thousand feet of one inch and two inch spruce, and three hundred thousand feet of one inch and two inch No. 1 Hemlock, advise stating prices, lengths and widths. Box 202, Canada Lumberman, Toronto. 11-12

### Wanted–Rock Elm

250,000 to 350,000 feet of 10/4 No. 1 common and better, standard lengths, 6 ins. and wider. Will take the stock green or dry. Address American Lumber & Manufacturing Company, Pittsburg, Pa.

## For Sale–Lumber

### Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
c Montreal, Que.

### For Sale

PILING, any length in Spruce, Red, White and Jack Pine or Hardwood.
Telegraph Poles, Ties and Fence Posts. Square Cedar and Hemlock up to 12 in. x 12. Correspondence solicited.

ANGUS PRENTICE & SON,
189 Arthur Street,
9-14 Toronto, Ontario.

### FOR SALE
### Norway and Jack Pine—Mill Run

| | |
|---|---|
| 1 x 4/5 x 10/16 ft. | 1,000,000 ft. |
| 1 x 6 | 500,000 ft. |
| 1 x 8 | 85,000 ft. |
| 1 x 10 | 14,000 ft. |
| 2 x 4 | 165,000 ft. |
| 2 x 6 | 220,000 ft. |
| 2 x 8 | 320,000 ft. |
| 2 x 10 | 218,000 ft. |
| 2 x 12 | 65,000 ft. |
| Norway Pine Culls | |
| 1 x 4 and up x 10/16 ft. | 1,500,000 ft. |

DEVON LUMBER CO.,
5t.f. Ottawa, Ont.

### We Have a Full Stock

of Hardwood, Hemlock and White and Norway Pine Lumber, Norway and White Pine Piling, up to 60 ft. Keenan Bros., Limited, Owen Sound, Ont. 3t.f.

## For Sale–Machinery

### Machinery for Sale

One Double Surface Planer.
Power-Feed Rip Saw.
12-in. Moulder.
Heavy Flooring Machine.
Vertical Boring Machine.

A. J. LINDSAY,
11-13 92 Pembroke Street, Toronto.

### Woodworking Machinery For Sale

1 No. 51 Crescent universal woodworker; 2 24-in. planers and matchers; 3 12-in. buzz planers; 1 12-in. four-side moulder; 1 No. 802 Canada Machinery Corporation shaper; 5 30-in. Ideal pedestal bandsaws; 2 No. 619 Canada Machinery Corporation saw tables; 1 36-in. double drum sander; 1 20-in. American wood scraper.

H. W. PETRIE, LTD., Toronto.

### Rebuilt Veneer Machines

We have the following rebuilt veneer machines ready for immediate shipment.
1 Coe Lathe, 50-in. swing, 88-in. knife, 6-in. spindles.
1 Coe Lathe, 50-in. swing, 64-in. knife, 5-in. spindles.
1 Coe Lathe, 50-in. swing, 76-in. knife, 6-in. spindles.
1 Coe Lathe, 42-in. swing, 60-in. knife, 3⅜-in. spindles.
1 Coe 100-in. Power Clipper.
1 Coe 54-in. Power Clipper.
1 Coe Type A. Stamper.

These machines are decided bargains and carry the same guarantee as we give our new ones. Prices on application.

THE COE MFG. COMPANY,
Painesville, Ohio.

## Wanted–Machinery

### Wanted

A second-hand House or Koval Filing Machine in good repair. Address, Herron Brothers, Limited, McKinnon Building, Toronto. 10

## Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra.
Minimum charge 25 cents

Band and saw filer wants position. Strictly reliable, steady and up-to-date. Thoroughly dependable. Best references. Box 181, Canada Lumberman, Toronto. 8-11

Band Saw Filer wants Position. A1 reference; fifteen years' experience. State what you have in first letter. Address A. W. Woodward, 57 Kirkwood Street, Akron, Ohio. 9-12

WANTED—Position by experienced Band Sawyer. Sober. First-class reference. Address Frank Weston, P. O. Box 59, Odanah, Ashland County, Wis. 9-12

### Position Wanted

Band sawyer wants position. Single or double cut. Best of references. Used to fast rigs. Can come at once. Box 204, Canada Lumberman, 119 Board of Trade, Montreal. 11-14

## Business Chances

### For Exchange

A splendid manufacturing plant in central New York State representing an investment of $160,000. Sixteen years standing. No bonded indebtedness. Wish to exchange for timber interests or a going operation. Best of reasons for wanting to exchange. Address, J. W. Powell, Canisteo, N.Y. 11

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

## Miscellaneous

### Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

### For Sale

Copies of "The Preservation of Structural Timber," by Howard F. Weiss. Published in 1915 by McGraw-Hill Book Company. 312 pages, illustrated. Price $3.00. Canada Lumberman, 347 Adelaide Street West, Toronto.

### Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

### Lumber to England

In view of the fact that it has been generally supposed that the lumber exporting of Canada and the United States has been hard hit by the European war, a recent circular issued by Farnworth & Jardine, of Liverpool, contains some interesting information. As compared with last year, the report shows a material decrease in number of items, but in others, the figures of imports during January and February are surprisingly near normal, and in some cases they are greater than they were a year ago. In the item of British Columbia and Oregon pine, logs and planks, the imports at Liverpool, Birkenhead and Garston amounted to 160,000 cubic feet as compared with only 33,000 last year. Pitch pine planks received at the same ports during the two months, amounted to 247,000 cubic feet, as compared with 124,000 cubic feet during the same months of 1914. Canadian and American oak plank importations totalled 182,000 cubic feet as compared with 252,000 last year. Importations of ash amounted to 73,000 cubic feet as compared with 63,000 cubic feet last year. The imports of pitch pine railroad ties were 9,500 pieces, against none in January and February of last year. Spruce and pine deals from New Brunswick and Nova Scotia totalled 4,530 standards, as compared with 3,200 last year, and 21,000 cubic feet of birch planks were imported as compared with 32,000 cubic feet a year ago.

### Opening for Wood Pulp in Spain

The Department of Trade and Commerce has received a communication from Bilbao, Spain, which states that present conditions are favorable for the introduction of Canadian wood pulp on the Spanish market. It is written by the managing director of a company having excellent business connections with the large paper manufacturers of the Peninsula, and who desires to obtain the representation for the Spanish Peninsula of a large producer or a group of Canadian producers of wood pulp. Owing to the difficulties occasioned by the war, in the importation of wood pulp of Scandinavian origin, as practised in former years, the question of raw material has become an important consideration to the Spanish paper manufacturers.

The following figures of the imports of pulp into Spain will give some idea as to the importance of the market:—

| | 1912 Tons | 1913 Tons |
|---|---|---|
| Norway .. .. .. | 6,200 | 6,370 |
| Baltic Russia .. . | 1,890 | 1,390 |
| Sweden .. .. .. | 18,025 | 34,257 |

If the Canadian producers of wood pulp can quote prices to compete with the Scandinavians, Spain should present a good opening for their product. Those interested should communicate with the Department of Trade and Commerce, Ottawa, for the name and address of the writer of the communication referred to, as he is desirous of being brought into touch with one or several large Canadian producers of wood pulp. (Refer File No. A. 1107).

### Customary Irish Lines of Lumber

The preferred size of board in Ireland is 12 feet long and 3 by 9 inches in depth and width, and

so common are these dimensions that there exists a so-called "Irish standard" comprised of 120 pieces of the size specified. This standard is not infrequently used in Ireland, and should not be confused with the St. Petersburg standard. Pacific Coast mills prefer not to cut pieces as small as the Irish deal, and have always charged extra millage for the work of cutting lumber to this specification. It is a specification, however, which is conveniently suited to the size of timber cut by the Scandinavian mills.

As distinguished from the deal just mentioned, there is the scantling from 5½ down to 3 inches in width from 4 to 1½ inches thick. This grade has been much used in the erection of huts and camp shelters for military purposes both in England and in Ireland; but the grades of lumber used for this class of work have been too diverse for any general statement.

A very heavy trade in Ireland has always been done in pine timber either 10 by 10 inches or 20 by 20 inches in thickness and from 40 to 60 feet in length. This timber has been of Canadian spruce or of Baltic pine, while pitch pine timber of equal thickness but in shorter lengths has been drawn from Mobile and New Orleans. Since the commencement of the European war some shipments of Oregon pine in these sizes have reached Ireland, and they are regarded as a passable substitute for the wood to which Irish dealers and workmen are accustomed. In fact, aside from the conservatism of the dealers and workmen, it seems clear that the Pacific Coast wood is fully equal to the Scandinavian and Canadian wood previously used.

An analogous line in which shipments from the Pacific Coast have been taken for the first time during the past few months is that of railway ties. In one case an order for 20,000,000 feet of Pacific ties was placed by a single Liverpool firm. The dimensions are 9 feet in length by 10 by 5 inches cross-section, and the United Kingdom price is about $68 per standard, of which nearly $50 represents cost of transportation from America.

"Clear" spruce lumber from the Pacific Coast has been reaching Ireland in some quantities since last August, the dimensions being from 1 to 2 inches in thickness and from 8 inches up in width, the average being about 13 inches, while the length ranges from 15 to 32 feet. This lumber is known in Ireland as silver pine or silver spruce, the Pacific Coast term "clear" not being current. The wood is used for high-class joinery (carpentry) and for the making of patterns in the machine shops at Belfast, Dublin, and Cork. The Admiralty dockyard at Haulbowline (Queenstown) uses this wood for patterns, buying it through Cork dealers, who are in turn supplied from Liverpool or London. This is the silver spruce utilized by all nations in the frames of dirigible and heavier-than-air flying machines.

Pacific Coast "merchantable" spruce lumber is another grade which is being tried out in Ireland at present. It is cut in the popular dimensions, 9 or 11 inches by 3 inches cross-section, with a length of 16 to 32 feet. The sources of boards of these specifications have hitherto been the Gulf of Bothnia and the St. Lawrence Basin.

Russia is by far the heaviest supplier of timber and boards to Ireland in time of peace, as it is to the entire United Kingdom. While the Irish import statistics do not indicate sources of imports, it is probable that Russia furnishes almost one-half of the aggregate wood purchases, while Norway and Sweden combined come second, Canada third, and the United States fourth.

On the whole there is no doubt that Canadian timber exporters, especially those on the Pacific Coast, have now an exceptionally favorable opportunity to make their lines familiar to Irish lumber merchants and artisans—an opportunity which in so conservative a market is not likely to recur for another generation.

There are large quantities of sawn (soft) lumber imported into Ireland annually, as is shown by the following statistics: In the calendar year 1913 there were 211,415 loads of boards and deals imported, valued at $4,629,631; in 1912, 228,380 loads, valued at $4,584,573; in 1911, 826,900 loads, valued at $4,024,108. In addition, there were 11,956 loads of sawn timber (value, $392,741) imported in 1913, 7,946 loads (value $251,349) in 1912, and 12,003 (value, $372,379) in 1911. For the port of Dublin alone the same classification is not followed. For the two half years ended June 30, 1913, and June 30, 1914, there were 11,463 loads and 4,105 loads, respectively, of timber imported.

Statistics showing quantities and values from all countries into Ireland are not available. It is the consensus of opinion that of the countries exporting to Dublin Canada leads, Sweden is second, Russia third, Norway fourth, and the United States fifth. Russia is rapidly forging to the front.

The sizes most used here are 3 by 6 inch, 3 by 7 inch, 3 by 8 inch, 3 by 9 inch, 10 to 20 feet average. Spruce for deals is by far the most popular. The largest importer here states that for a cargo of 1,000 to 1,200 St. Petersburg standards coming from Canada (St. Johns or Campbelltown) consisting of 10 per cent. of 11 by 3 inch, 35 to 40 per cent. of 7 and 8 inch by 3 inch, 50 to 55 per cent. of 9 by 3 inch, 10 to 15 linear feet, the c.i.f. Dublin prices before the war were from £10 10s. ($51.10) to £11 ($53.53) per standard. Now they range from £14 10s. ($70.56) to £16 ($77.86). The Russian prices are practically the same. Swedish flooring boards 7 by 12 inches are practically the same. Swedish flooring boards 7 by 12 inches by 10 to 24 feet, white pine, were £11 10s. ($55.96) to £12 ($58.40) per nominal standard (boards measured in the rough) c.i.f. Dublin. Those of red pine were about £1 ($4.87) more per St. Petersburg standard. Of the white spruce scantlings, 2 by 4½ inch, 1½ by 4½ inch, 4½ by 3 inch, 10 to 24 feet, the price before the war was £9 10s. ($46.23) to £10 ($48.67) a standard. For the 10 by 10 inch up to 16 by 16 inch, in cargoes of 1,200 to 1,500 loads of 50 cubic feet (logs averaging 30 cubic feet and 28 linear feet), prices were 67s. 2d. ($16.42) per load. On January 21, 1915, the exporters refused 92s. ($22.38). Another firm states that there will be few sales here now except at the rate of from £10 10s. ($51.10) to £12 ($58.40) per St. Petersburg standard of 9 x 3 ins. x 12 ft. If possible all quotations should be given c.i.f. Dublin and in English currency.

The cheaper deals are used principally in common roofing, floor joists, common framing, fences, etc. The better ones, such as the red from Archangel and Sweden, are used for sashes, doors, framing, etc.

The usual credit terms are either 4 months credit or c. o. d. against document, with varying discounts on the f.o.b. prices—Sweden and Norway giving 2½ per cent., Canada 2 per cent., Russia 1½ per cent. The principal ports of entry into Ireland are Belfast, Dublin, Queenstown, and waterford.

### Canadian Paper to Australia

The export of British Columbia paper to Australia and New Zealand, the initial shipment having been made about a year ago, is now of considerable importance. Since the commencement of this trade it is estimated that 15,000 tons have been exported from British Columbia to these countries.

# Review of Current Trade Conditions

### Ontario

Reports from wholesalers who are devoting their time to the country trade in Ontario continue to indicate a very quiet situation in all parts of the province. As we have reported formerly, the chief feature of the country trade today is the fact that activity is to be found only in such places as are dependent upon the farming trade for most of their business. In the manufacturing districts, although there is a small amount of business to be had, it is so keenly sought after that it is not proving very attractive. The trade in the large cities continues very quiet, building operations having shown no important improvement. Under the above conditions it is not either possible or advisable to go into detail in regard to the trade. The general situation is one of patient waiting for improvement. There are many among the trade who feel that this improvement must come before very long, and they bring forward very definite arguments in support of their belief, most of these arguments being based upon the large amount of money which is being circulated in Canada as a result of the contracts for war material. The question is, however, in what direction this money will circulate, and it still remains to be shown whether the lumber trade will secure any extensive share of it. Reports recently received from Northern Ontario confirm former reports that most of the drives have come out fairly well, but that there has been a considerable quantity of logs in the aggregate hung up. The North Shore output has all been sold for export to the United States at prices slightly below last year's prices.

Trade conditions in the Ottawa Valley are fair, but not especially active. Trade in white pine and spruce with United States markets is mostly in car load lots, indicating a hand-to-mouth demand only.

### Eastern Canada

Trade conditions at St. John are very quiet. The local building situation shows no life worth mentioning. Local prices on low grade stocks are easier on account of keen competition by lumber merchants and on account of the very quiet demand. Refuse lumber is reported to be selling at about $1 to $1.50 per M. lower than last year's prices. Hemlock boards are also easier. All kinds of boards in fact are too plentiful for the demand and there is not much movement of this class of stock to the American markets. During the past few weeks however, there have been a few slight indications of improvement in the house building line and it is not entirely improbable that a fair amount of activity will yet be seen this year. The export situation is entirely governed by the shortage of tonnage. Recently there have been a very encouraging number of arrivals of sailing vessels which are taking on lumber at 120s. to 130s. per standard from St. John to Great Britain. All the cuts of deals for the coming season throughout New Brunswick are reported to have been sold at about $19.50 for the ordinary specification, which is $2 per M. higher than former record prices. Most of the mills are devoting their attention to English deals and the amount of stock being sawn for United States markets is correspondingly reduced. It is expected that there will be about 70,000,000 feet of logs come down the St. John this year for the mill at St. John. The demand for lath continues fairly active and prices are steady at about $2.75 to $2.80 on the wharves at St. John. There is not much demand for shingles. Extras and clears are very dull, but second clears and extra No. 1 are moving fairly well. Local prices are: extras, about $3.75; clears, $2.85; second clears, $2.50; ex. No. 1, $1.70. The box business is very quiet.

The demand for eastern spruce at Boston slackened somewhat of late on account of the uncertainty in regard to the foreign policy of the United States and the developments which may come from it. It is also reported that New Brunswick dealers, finding it difficult to secure vessels for shipping their deals are looking a little more toward the New England and New York markets and that the result has been slightly easier prices. Most of the New England mills continue to quote $24 as the base price, Boston rate, for railroad shipment of frames to the wholesale trade, but there are an increasing number of producers who find $23.50 an attractive price. Business in general is good and prices remain fairly steady. Hemlock continues weak at Boston. The present price for good eastern hemlock clipped boards, 10, 12, 14 and 16 ft., is $20. There is little business in hemlock frames. Shingles are a shade less firm at Boston, but there is a fair volume of trade. White cedar extras range from $3.25 to $3.40; clears from $2.80 to $2.90 and second clears from $2.40 to $2.60. The demand for spruce lath is good, but offerings are heavy and prices remain at $4.10 to $4.15 for 1⅝ in. and $3.70 to $3.75 for 1½ in.

### United States

It is difficult to give a definite report of the lumber trade situation in the United States. Conflicting statements are heard from different sources, yet the majority of reports recently received are to the effect that improvement is distinctly noticeable. A very interesting statement was recently made by one of New York's most prominent bankers who said that the United States has ahead of it the best ten years industrially and commercially that it has ever had in its history. Lumbermen in the Eastern States are expressing much more optimistic opinions as to the situation than they did a short time ago. Retail enquiries are increasing in number. This condition is quite widespread, and if other departments of the business were as satisfactory as the retail end, the general situation would be very good. The export trade is showing an increased volume, although it is still extremely light. A readjustment of the ocean transportation difficulties is taking place which is commencing to show results. Improvement is reported in connection with the yellow pine trade, although it is still far from enjoying a satisfactory activity. The demand for structural material is said to be practically on a level with an ordinary spring season and prices are a little better. In the northern woods, pine, hemlock and spruce are moving fairly well. Spruce in particular is active and higher in price. Hardwoods are a little behind the rest of the market in improvement, yet some gain is reported.

Northern pine at Buffalo is not so active in the better grades as it was formerly. The lower grades, however, are moving very extensively and are stronger. No. 6 and 8 box are selling freely at $23 and $24, while one and a half inch box is bringing $26. No. 4 barn is being sold at $22. At Chicago, northern pine continues firm and at Buffalo there is a fairly good volume of trade, although the actual transactions are in small quantities.

### Great Britain

A fair quantity of general business is reported from London, but the outlook is not thought to be very satisfactory, on account of the difficulty in securing vessel room for stocks required at London. To a limited extent, however, stocks are coming in. The high values obtainable at London for any useful size are expected to assist in keeping up the supply. Deliveries at London docks for the week ending May 8th amounted to 4,582 loads, as compared with 7,282 during the corresponding week of 1914.

Spruce c.i.f. values at Liverpool continue unchanged, but firm, and are not expected to show any reduction so long as the f.o.b. figures remain unchanged. Freight rates are firmer than ever, with a continued upward tendency. The Timber Trades Journal, London, Eng., in its May 15th issue, says:—"The question naturally arises, Can shippers hold out for their ideas of f.o.b. values? And herein lies the danger, if any there may be, of c.i.f. values declining. Can the shippers afford to hold all their stocks for full values? Not only will the "cut" be under normal, but shippers have had to pay considerably advanced prices for their logs. The main point is that most shippers have already disposed of a good proportion, if not the greater proportion, of their stocks either on a freight basis or else a clean c.i.f. sale, that is, leaving out the Canadian and American markets. Therefore, there is not the margin for a big drop for them unless it is going to be a very costly one, and having disposed of a reasonable proportion of their stocks, if they cannot obtain their figures they are hardly likely to throw the balance away just for the sake of realizing it. The shippers realize that when this war is over an unprecedented demand will take place, and that they are more likely to obtain better f.o.b. values than they are doing at present. Whether spot values will advance depends entirely on the consumptive demand, and at the time of writing this is not altogether as brisk as it might be, but it may be only a temporary dullness between the end of the liner parcels and the commencement of the import season proper, and combined with the annual stocktaking which occupies the attention of many consumers at the ends of the months of April, May and June."

---

A despatch from San Francisco, states that lumber charters continue to show an upward tendency. Charters made recently have practically cleaned up the available supply of tonnage on the coast and shippers have engaged a large number of vessels for loading, as far on as next December. Practically all of this business is on Australian account with 65s. per thousand superficial feet as the going rate for Sydney, and 80s. for Melbourne.

View of Mills in Sarnia.

# BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

## Ottawa Valley News—Many Suspicious Fires

Ottawa, May 24th (Special to the Canada Lumberman):—Several more or less costly fires have occurred in the plants of local lumbermen recently, and, as a result, nearly all the firms in the district have doubled their staffs of night watchmen, for it is believed that some of the fires have been the work of incendiaries. After a fire in the Dupuis Lumber Company's yard last week a can of coal oil, half full, and some oily rags, were found in the yard. Some of the fire insurance companies are talking of increasing the rates on lumber piles in Ottawa and vicinity.

Last week several thousand dollars damage was done to the sulphite mills of J. R. Booth, when a fire broke out in the barker machine room and spread through the building. The fire did not spread to the lumber mills.

Heavy rains during this month have helped to keep the water up in the Ottawa River and its tributaries, but it is not yet as high as lumbermen would like to see it. However, business at the mills is being prosecuted without any handicap due to the lack of water. Trade throughout the Ottawa Valley is reported to be fair. There is some movement to the United States in white pine and spruce in carload lots particularly, which indicates that buyers over there are carrying on what might be termed a hand-to-mouth policy. The situation between the United States and Germany is being watched with considerable interest here, for it is known that should it develop into something serious business generally would receive a staggering blow. Italy's entry into the war is going to place a further handicap on the export trade—if any further handicap could be placed on it.

The Railway Commission started on a tour of the west last night, and while they are away will hear cases of interest to lumbermen. On June 1st, a sitting will be held in Vancouver to hear the complaint of the Adolph Lumber Company, that the Great Northern Railway charges $1.10 per 1,000 feet on logs from Mott, B.C., to Baynes, B.C., while the contract made between the parties specifies a rate of $1 per thousand. The Kootenay Shingle Company also has a complaint against the Great Northern because the railway company refuses to make an allowance for tack scale weights on cars of lumber and shingles to Eastern Canada. The Grain Growers' Lumber Company, of Vancouver, B.C., is complaining that the C. P. R. favors Western Canada against the east in mixed carloads of lumber and shingles.

Plans for two movable rudder or fin shear booms, to be built in the Rainy River, about two miles below the town of Rainy River, Ont., have been filed with the Public Works Department for approval.

The Railway Commission is considering the application of the Montreal Board of Trade for an order directing that the mileage rates on pulpwood as per the Canadian Pacific Railway tariff be applied to Cap Magadalen, Que.

## The Montreal Trade—Shipping Situation Improving

Montreal, May 25th (Special to the Canada Lumberman): Business in the lumber market is slow. In normal times a large number of orders would be placed at this period of the season, but owing to the slackness in the building trade, there is little doing. As far as can be judged, the contracts of importance to be let this year will be very few, although there are some projects in hand which will ultimately involve very large expenditures. On the other hand, business with the United States continues to be satisfactory.

Reports from the province state that there is a lull in the furniture and piano trades, with a slackening off in the orders for lumber and veneers.

News from Three Rivers as to the drives on the tributaries of the St. Maurice River is that most of the creeks have been driven out, and that logs left behind last season owing to low water have been run out this year.

The export season has now fairly started, and with an improvement in the shipping situation, considerable quantities of spruce and birch have been sent to the United Kingdom. So far, the exports of pine have been comparatively slow. The great demand is for spruce, and this is being sent as fast as possible. Bennett and Company, the representatives of Boss and Company, London, are credited with having already exported a large quantity of lumber, having booked space a considerable time before the opening of navigation. Four boats of the Canada Steamship Lines, which hitherto have been engaged in the Lakes trade, have been chartered by lumber firms, at 140s. One of these boats will load at this port and the other three at lower Quebec ports. The trade has been to a certain extent interfered with by the demands of the Government. Firms who make arrangements for shipping by given boats are never sure of obtaining the space agreed upon, owing to the sudden requisitions of the Government. The result has been that in some instances cars of lumber have been ordered to the docks and then unloading delayed, the lumber firms having to pay the consequent demurrage charges. This is felt to be an injustice, which might be avoided by a little more consideration on the part of the Government officials in givng earlier notice of their requirements.

The Dominion Mahogany and Veneer Company, of Montreal West, recently sent some excellent veneers to the British market.

## New Brunswick Stocks Well Sold

The chief subject of interest to New Brunswick exporters during the past year has been that of tonnage. It has been an exceptionally difficult year for moving stocks. The output of local mills, in the hands of exporters at St. John still remains to some extent at the mills, as buyers could not get tonnage enough at any price to make shipments. The advance in freights commenced immediately after the outbreak of the war, starting at about 50s. per standard, and continued to 140s. from St. John to British ports. When the rate was about 100s. buyers could have secured a fair amount of tonnage, but they held off in the hope that the rates would fall. In this they made a mistake.

A natural result of the high cost of tonnage has been the entrance of sailing vessels into the trade. A large number of sailing vessels have been secured to load at St. John at 120s. to 130s. and the port is now commencing to look something like it did in the old days, when square-rigged vessels were the chief means for making shipments of deals. Lately, there has been so satisfactory a supply of sailing vessels at St. John that it is expected that the old deals will soon be cleared up. There is still, however, quite a quantity of stock which was produced by portable mills and has been held on scows awaiting shipment. In spite of the scarcity of tonnage, there has been a good demand for stocks and nearly all the cuts of deals for the coming season, not only at St. John, but generally throughout the province, have been sold at prices in the neighborhood of $19.50 for a specification running 50 per cent. 7 and 8 in. x 3 in., balance 9 in. x 3 in. and up. This is $2 higher than has ever been received before. Just at present, however, no bids are being made for any new deals, as exporters have ceased to take any chances on tonnage.

It is reported that a considerable quantity of Swedish stock is now finding its way into England, more indeed than was anticipated, and that, as a result, deals are easier on the English market. New Brunswick stocks of deals are not heavy and an improvement in the freight situation would undoubtedly clear them up. Very little stock is being sawn this year for United States markets.

A careful estimate indicates that stocks of all kinds of deals at St. John, old, new and portable sawn, amount to about 10,000,000. Nearly all the English stocks on the North Shore of the province have already been shipped. If everything which has been cut on the St. John for St. John mills comes out, there will be about 70,000,000 feet of logs available for this year's sawing.

## An Interesting Advertisement of Timber Lands

An interesting announcement in regard to Florida timberlands for sale appears in the advertising pages of this issue. The property is in the hands of Mr. J. N. Lotspeich, Morristown, Tenn., and includes many attractive lots which will repay careful investigation by our readers. Each of the properties mentioned in the advertisement has many special attractions, not only as to the intrinsic value of its timber, but in some cases there are other values available in the way of carbonate of lime, phosphate, etc., which are of considerable importance. The proximity of railroads and the excellent quality of the timber growing upon these limits also make the propositions attractive ones from an investment point of view. Those of our readers who are looking for timber investments will do well to study this advertisement.

During 1912 the exports of timber from Russia were valued at $78,990,860, and the imports at $6,767,758. Canada does not figure in this trade.

## Campbellton, New Brunswick

## United States Exports of Wood Goods

The United States, being one of Canada's chief competitors in foreign markets for lumber, it is interesting to note the extent of the export trade of that country. The following table shows the volume and values of all United States exports of wood and manufactures of wood during the nine months ending March, 1915, and during the corresponding periods in the two preceding years, together with the quantities shipped to each of the export markets:

| Wood, and manufactures of: | 1913 | | 1914 | | 1915 | |
|---|---|---|---|---|---|---|

## United States Customs Duty on Wood

The tariff on wood entering the United States includes the following:—

| | Rates of Duty |
|---|---|
| Wood: Logs, timber, round, unmanufactured, hewn or sawed, sided or squared; pulp woods, kindling wood, firewood, hop poles, hoop poles, fence posts, handle bolts, shingle bolts, gun blocks for gun stocks rough hewn or sawed, or planed on one side; hubs for wheels, posts, heading bolts, stave bolts, last blocks, car blocks, heading blocks, and all like blocks, or sticks, rough hewn, sawed, or bored; sawed boards, planks, deals, and other lumber, not further manufactured than sawed, planed, and tongued and grooved; clapboards, laths, pickets, palings, staves, shingles, ship timber, ship planking, broom handles, sawdust, and wood flour; all the foregoing not specially provided for in this section ... | Free |
| Woods: Cedar, ..... and all forms of cabinet woods, in the log, rough, or hewn only, and red cedar (Juniperus virginiana) timber, hewn, sided, squared, or round; sticks ..... and other woods not specially provided for in this section, in the rough, or not further advanced than cut into lengths suitable for sticks for umbrellas, parasols, sunshades, whips, fishing rods, or walking canes ... | Free |
| Cedar commercially known as Spanish cedar, lignum-vitae, lancewood, ebony, box, granadilla, mahogany, rosewood, and satinwood; all the foregoing when sawed into boards, planks, deals, or other forms, and not specially provided for in this section, and all cabinet woods not further manufactured than sawed ... | 10% |
| Veneers of wood ... | 15% |
| Paving posts, railroad ties, and telephone, trolley, electric-light, and telegraph poles of cedar or other woods ... | 10% |
| Casks, barrels, and hogsheads (empty) sugar-box shooks, and packing boxes (empty), and packing-box shooks, of wood, not specially provided for in this section ... | 15% |
| Boxes, barrels, or other articles containing oranges, lemons, limes, grapefruit, shaddocks, or pomelos ... | 15% |
| Toothpicks of wood, or other vegetable substance ... | 25% |
| Butchers' and packers' skewers, of wood, per M. ... | 10c. |
| Other ... | 20% |

## Nine Months' Imports Into United States

United States imports of wood and manufactures of wood during the nine months ending March, 1915, amounted in value to $47,077,353. During the corresponding periods in the two preceding years the totals were as follows:—1914, $46,619,804; 1913, $46,940,450.

The imports of boards, planks, deals and other sawed lumber were largely from Canada, the figures being as follows:—

| Boards, planks, deals, and other sawed lumber— | 1913 Quantity | 1913 Value | 1914 Quantity | 1914 Value | 1915 Quantity | 1915 Value |
|---|---|---|---|---|---|---|
| Canada ... M ft. | 781,827 | $13,586,720 | 654,457 | $12,354,143 | 637,779 | $12,055,814 |
| Other countries .. M ft. | 36,273 | 656,087 | 24,986 | 571,067 | 19,657 | 424,308 |
| Totals ... M ft. | 818,100 | 14,242,807 | 679,443 | 12,925,210 | 657,436 | 12,480,122 |

United States imports of wood pulp during the same period were as follows:—

| Wood pulp— | Quantity | 1913 Value | Quantity | 1914 Value | Quantity | 1915 Value |
|---|---|---|---|---|---|---|
| Germany ... tons | 52,513 | $1,987,463 | 46,689 | $1,882,913 | 35,611 | $1,583,528 |
| Norway ... tons | 63,336 | 2,726,186 | 57,548 | 2,618,897 | 79,652 | 3,815,945 |
| Sweden ... tons | 102,942 | 3,514,734 | 95,822 | 3,519,784 | 140,102 | 5,328,740 |
| Canada ... tons | 165,103 | 3,868,847 | 177,491 | 4,376,750 | 237,413 | 5,952,592 |
| Other countries .. tons | 14,189 | 447,446 | 5,976 | 227,559 | 9,803 | 380,966 |
| Total ... tons | 398,083 | 12,544,676 | 383,526 | 12,625.903 | 502,581 | 17,061,771 |

The monthly average import prices of wood and manufactures of wood in the United States during March, 1915, and several preceding months, were as follows:—

| Wood, and manufactures of: | Aug. | Sept. | Oct. | Nov. | Dec. | Jan. | Feb. | Mar. |
|---|---|---|---|---|---|---|---|---|
| Pulp wood ... Cord | $7.29 | $7.26 | $7.51 | $7.06 | $6.47 | $6.07 | $5.83 | $5.90 |
| Boards, deals, planks, etc. .M ft. | 19.50 | 18.90 | 18.73 | 18.98 | 17.54 | 19.22 | 19.22 | 18.71 |
| Shingles ... M ft. | 2.27 | 2.12 | 2.06 | 2.09 | 1.96 | 1.93 | 1.93 | 1.99 |
| Wood pulp: | | | | | | | | |
| Mechanically ground ... 100 lbs. | 14.33 | 14.78 | 18.35 | 17.45 | 19.22 | 17.93 | 16.74 | 17.44 |
| Chemical— | | | | | | | | |

| Bleached ... 100 lbs. | 51.01 | 55.16 | 52.99 | 54.52 | 52.99 | 50.52 | 53.60 | 54.85 |

# Manufacture of Creosote Increases

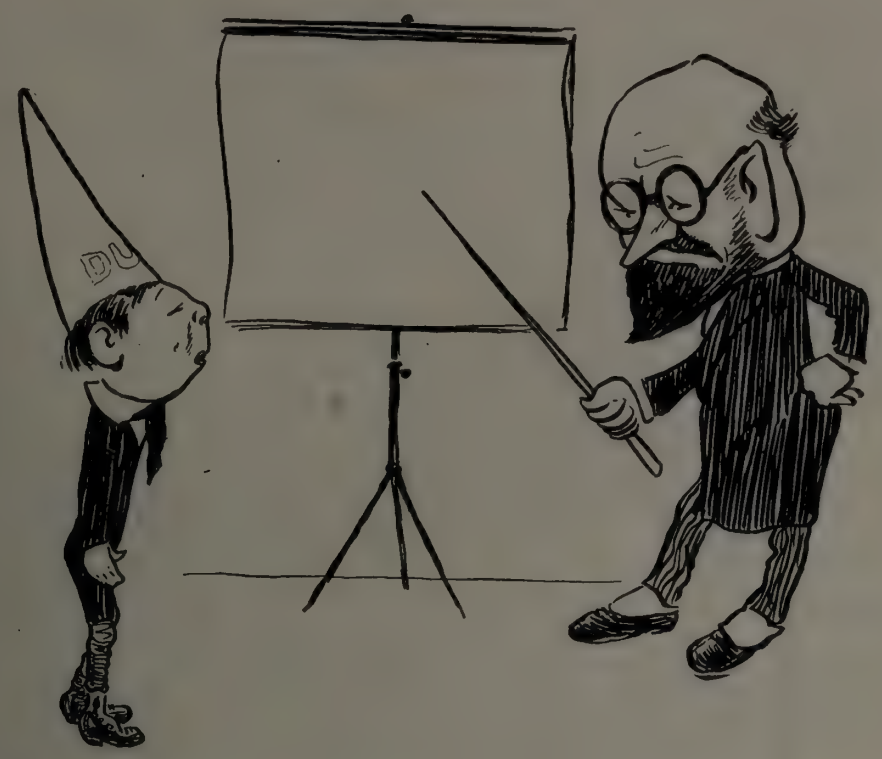
### Shortage of Imported Wood Preservative Stimulates U. S. Production—Tie Plants Largest Consumers

Owing to a falling off since August 1st of nearly thirty per cent. in shipments of creosote from England and Germany, whence comes all but a small part of the imported oil used by wood preserving plants in this country, United States manufacturers have taken steps which, it is estimated, will increase production of the domestic article by about 25 per cent. The imported oil ordinarily forms about 65 per cent of the total used in the United States, where creosote is the most important wood preservative.

The statistics gathered show that wood preserving is one of the most rapidly advancing industries in the country. In 1895 there were fifteen plants in the United States; in 1914 there were 122 plants of all kinds, 100 being of the pressure-cylinder type. Ninety-four of these plants last year used more than 79 million gallons of creosote oil, more than 27 million pounds of dry zinc chloride, and nearly 2½ million gallons of other preservatives, such as coal tar and crude oil, treating a total of nearly 160 million cubic feet of timber, an increase of about 7 million cubic feet over 1913, and of 35 million cubic feet over 1912.

The most important consumers are the large plants in which railroad ties are treated. The preservatives materially lengthen the ties' period of service, lessen the labor cost involved by renewal, and decrease the drain upon the forests due to tie-cutting. To some extent the treatment of fence posts and other forms of farm timber is being taken up, an inexpensive apparatus and method having been devised by the Department of Agriculture; but as yet the use of wood preservatives by farmers is on too small a scale to have any importance in the total, while the practice of treating telephone poles is in its incipiency in this country.

"With the rapid advance of this industry as a whole," says a United States Government report, "the choice of preservatives has been fairly well established, but the kinds and classes of materials to be treated need development along certain lines. In Germany and other European countries practically all cross-ties laid by the railroads are treated with chemicals or preserving oils. In this country but 30 per cent. of the ties purchased by the railroads are subjected to such treatment. The number of poles treated in this country is a very small per cent. of total in use."



# A HARD LESSON

For many people to learn is how to buy right, that is to obtain the greatest value for every dollar expended. This is more true of lumber than most commodities.

Price does not establish Value. You know from experience that some of the most expensive material you have ever bought was purchased at the cheapest price.

Our business has been built up on a "value" basis. We aim to give the fullest possible value for each and every one of your dollars.

***THAT ORDER PLACED WITH US INSURES***

***Prompt, Courteous and Efficient Service.***
***The choicest lumber, best grades and smoothest mill work.***
***Your most critical customers pleased.***
***Satisfaction from start to finish, and the mental relief that this assures.***

If your business needs a Spring Tonic, try a car of Fenderson Spruce, New Brunswick Shingles, and Lath,—if your trade is not as good as you'd like,—try the "Quality Policy" as a stimulator. One of the best advertising mediums you can employ.

***Make that next car a Fenderson Car. You'll like it.***

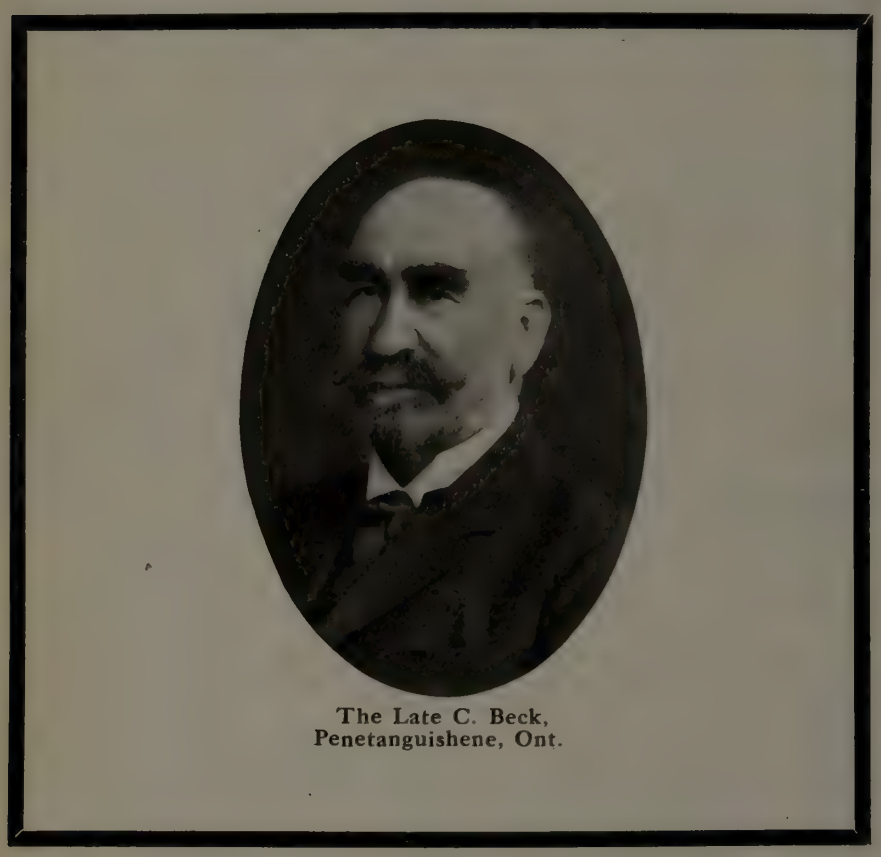
## Death of Mr. Beck, Penetanguishene, Ont.

The death of Mr. C. Beck, Penetanguishene, Ont., has removed from the lumber industry of Canada, one of its best known members. Mr. Beck came to Canada about 1865 and worked on a farm for a year near Stratford. He started in the contracting business and later ran a small sawmill at Elma. He went to Penetanguishene about forty-two years ago and started in partnership with G. N. Fuller, who had a sawmill on the site of the present mill. A short time after, Mr. Beck bought out Mr. Fuller, and continued in the same place until the plant was wiped out by fire about 1880. Then he built the present mill, which was known all over the Georgian Bay as the "Big Mill," and was the fastest cutting mill in that section at the time. The mill was splendidly built, as it is still running to-day with practically the same equipment as when built, and the timbers, which were all hewn, are practically as good as when built. Later Mr. Beck bought out the new Keene mill and property, situated a little further along the Penetanguishene Bay. This mill was operated until it was burned, in 1912, when the present new mill was constructed on the old site.

In 1889 the C. Beck Manufacturing Company, Limited, was incorporated, with Mr. C. Beck as President, an office he held until his death. The company, under his management, continued to branch out in other lines, as well as lumbering. A planing mill and box factory was established in connection with the sawmill and later a branch box factory was built in Toronto to take care of the city trade. In 1906 a woodenware factory was established at Penetanguishene to manufacture wooden pails and tubs. Mr. C. Beck was also President of the Savanne Lumber Company, at Savanne, Ont., which was established by him some years ago, and later sold to Hogan Bros.



The Late C. Beck,
Penetanguishene, Ont.

The late Mr. Beck took a great interest in civic affairs and was Chairman of the Protestant Separate School Board for many years, and Mayor of Penetanguishene for four consecutive years. He was instrumental in establishing the present water system of the town and formed the Penetang and Midland Electric Light Power & Railway Company, which supplied the town lighting up to a few years ago, when it was taken over by the Hydro.

## Death of J. D. Shier, Bracebridge, Ont.

Mr. J. D. Shier, President of the Shier Lumber Company, Bracebridge, Ont., died at his home on May 21st. Mr. Shier was born in the township of Brock, in the county of Ontario, almost seventy years ago. Thirty-one years ago he went to Bracebridge, and to him belongs the credit for the wonderful rise of his business from a small sawmill to one of the largest sawmills and planing factories in the province. The deceased was prominent in municipal, political and religious circles. In 1903 he was Mayor of Bracebridge, and for ten terms sat on the Council. When Bracebridge was in the Federal riding of North Ontario Mr. Shier contested a Liberal convention with the late George Grant, to whom he lost by a narrow margin. Mr. Shier is survived by his wife, four sons and an unmarried daughter, all of whom reside at Bracebridge.

## Foreign Markets—What They Use

The following references to export trade from the Pacific Coast are reproduced from "The Practical Lumberman" by Bernard Brereton:—

To Great Britain probably the largest sizes in merchantable are shipped for resawing, also the larger sizes in clears and selects. Long timbers are used for resawing and structural purposes. Considerable decking is also shipped to the United Kingdom.

Although the exports of Pacific Coast forest products to France are as yet somewhat limited, considerable quantities of clears and selects are being shipped there. Some merchantable lumber has also been shipped to France. The French customer usually wants his lengths cut according to the metric system, and quite a number of the well-known Pacific Coast mills are equipped for making metrical lengths.

To Germany, Holland and Belgium, larger sizes of clear and select Douglas fir are usually shipped for resawing purposes, although at times considerably smaller sizes, especially in the clears and selects, are asked for. Hamburg is probably the largest market for Douglas fir (Oregon pine) decking that the Pacific Coast mills have for this material.

Not very much lumber has been shipped to Denmark, but a few years ago some of the Columbia and Williamette River mills furnished an entire steamer cargo of clears and decking for shipment to Copenhagen.

Some clears have also been shipped to Italy, but this market is still to be developed.

To South Africa a great number of cargoes find their way yearly, composed principally of deal sizes and timbers for mining and constructional use. In the past considerable flooring has been shipped to South Africa.

To India, Douglas fir (oregon pine) finds its way in steamer lots. Usually India takes a fair assortment of sizes, probably inch, inch and a half and two-inch thicknesses, twelve-inch widths being in the greatest demand.

In China a rougher and cheaper grade of Douglas fir (Oregon pine) is usually called for, in ordinary constructional sizes; considerable long timber is also shipped to China, as is also flooring.

The demand from Japan is usually for large timbers for such constructional purposes as the timber of Japan is not fitted for, while occasionally cargoes are shipped in the upper grades for resawing purposes.

Not very much Douglas fir finds its way to Brazil and the Argentine Republic, but when the supply of eastern lumber becomes more limited, quite a trade should be developed in these countries. During the last few years several cargoes of Douglas fir and one cargo of spruce lumber from the Pacific Northwest have been shipped to these markets.

Chile, Peru, Bolivia and Ecuador have always been large consumers of Pacific Coast forest products. These countries are one of the largest markets for Douglas fir and redwood. The West Coast trade demands a good grade of merchantable fir and the sizes usually consist of the smaller dimensions for constructional purposes up to a small percentage of large timbers. A considerable amount of select, especially in sizes 1 x 6 and 1½ x 6 is called for in these markets.

Australia is probably the largest market for Pacific Coast forest products, especially in Douglas fir and redwood. Considerable white pine and sugar pine from California, and spruce from Oregon, Washington, and British Columbia are also shipped there. Australian orders are usually looked upon with favor, especially the sizes that are called for by the Melbourne and Adelaide markets, although some mills prefer the sizes that are called for in Sydney and Fremantle.

---

Strict economy in the use of safety matches is being advocated by merchants who know how limited the stocks in Australia are at present, and how difficult it is to secure further supplies while the war lasts. Already prices have risen 133 per cent. in the wholesale market, and only a most careful use of this article can prevent an actual shortage. The chief reason for this state of affairs is stated to be the regulation in force in England which compels the leading factory which supplies nearly all our matches to show no lights at night, it being situated close to the Thames estuary. Consequently the output is reduced to one-third of the normal quantity. In addition, supplies of raw materials, such as chemicals and timber, are most difficult to secure while the war lasts.

---

Mr. Thomas Wilson, formerly of Ottawa, but now of the Southern States, visited Toronto recently. Mr. Wilson is making plans for entering the hardwood manufacturing business, probably in the State of Georgia. He reports that during the past few weeks there has been a remarkable improvement in the United States in the lumber trade situation.

# Lumber and Pulp Men

You will save money in placing your orders now for your requirements for 1915 and 1916 operations. As you are aware there has been an advance in all Raw Materials equal to about 7½ % to cover War Tax. We are still in position to give you the same prices offered on January 1st.

## The West Indian Lumber Trade

As a result of the contract made between the Canadian Government and the Royal Mail Steam Packet Company, exporters of Canadian food products and manufactured goods now have easy access to all the colonies that have joined in the Canada-West Indies Preferential Trade Agreement. For St. John and Halifax the arrangements are especially advantageous, as they have no rail haul to pay for in shipping to the West Indies. Even Montreal and Toronto can ship goods to the British West Indian colonies, including rail freight to St. John and Halifax and steamship charges from those ports at less cost than to Alberta and Saskatchewan.

The British colonies, party to the preferential agreement, import lumber to the value of about £250,000 annually. This does not include Grenada, which has since given a preference to Canadian lumber, nor Jamaica, whose import is valued at approximately £150,150. The requirements of the British West India colonies, as a whole, for lumber, shingles, shooks, and staves average about £450,000 a year. Of the islands which are independent or belong to foreign governments, and have no preferential arrangements with Canada, the largest importer of lumber in Cuba, and the next Porto Rico. The requirements of these two islands are of the same general character as the British West Indies. So far as can be gathered from published official statistics, Canada supplies about £200,000 of the whole import. As the greater part of the lumber is shipped through New York, some of which is undoubtedly Canadian, it is probable that the figure for Canada is much larger.

Undoubtedly, the quantity of Canadian lumber supplied these markets is not adequate to the opportunities offered. The total value of the annual import amounts to over $8,000,000. Of this, Cuba and Porto Rico together import about five-eighths, the other foreign West Indies about one-eighth, leaving one-fourth as the amount of the import into the British West Indies.

### Canada Might Monopolize British West India Trade

A question of very great importance to Canada and the British West Indies is whether the Douglas fir of British Columbia can take the place of the pitch pine of the Southern States. The opening of the Panama Canal greatly shortens the distance between Canada's Pacific province and the British West Indies.

A number of lumber dealers in each of the colonies were recently asked their opinion about this, and they agreed in saying that they would buy British Columbia lumber in preference to that of the Southern States if convinced that it would stand the climate as well and resist the attacks of ants.

British Guiana and Trinidad in their trade statistics do not classify the different kinds of timber imported, so that it is impossible to judge from them what quantities of pitch pine, white pine, and spruce respectively were imported, but it may be stated that the imports from the United States were nearly all pitch pine and the imports from Canada white pine and spruce. British Guiana imported 2,780,080 feet of undressed lumber last year, of which 1,464,087 feet was from Canada and 1,313,601 feet from the United States.. British Guiana's imports of dressed lumber amounted to 63,751, of which United States supplied 39,672 feet and Canada 24,079 feet. There were 4,747 packages of shooks imported, of which the United States supplied 4,292 and Canada 455. The staves and headings imported numbered 759,571, of which 35,810 came from the United Kingdom and the remainder from the United States. Nearly all were of white oak.

Trinidad imported 4,759,948 feet of undressed timber, of which 3,577,226 feet was from the United States and 1,077,529 feet from Canada. Trinidad's importations of dressed timber amounted to 2,007,243 feet, of which 1,942,498 feet came from the United States and 269,244 feet from Canada. Evidently as regards timber, Canada does better in British Guiana than in Trinidad and there would seem to be room for an expansion of Canadian timber exports to Trinidad.

Barbados gives more detailed information about the kinds of timber imported. From Canada that island imported 5,446,675 feet of beech, birch, hemlock, spruce, and white pine. From the United States it imported 317,807 feet of such timber. The total quantity of pitch pine imported was 2,795,546 feet, of which 2,726,331 feet were from the United States. Barbados also bought 19,297,641 shingles from Canada and 536,000 wallaba shingles from British Guiana. The staves and shooks imported numbered 2,141,834 packages, of which 2,089,520 packages came from the United States and 34,314 packages from Canada, but it appears that 22,778 packages from the United States enjoyed the preferential rate, so they must have been Canadian shingles.

The Windward Islands imported 1,185,767 feet of white pine and spruce, of which 1,164,367 feet was from Canada. The Windward Islands imported 1,315,877 feet of pitch pine, of which 1,306,797 feet was imported directly from the United States and the remainder was probably imported indirectly from the United States.

The details of timber imports of some of the Leeward Islands for last year are not available but the previous year they imported 1,686,279 feet of white pine and spruce, of which 691,189 feet came from Canada, 39,469 feet from Danish ports, and 943,544 feet from the United Kingdom. The Leeward Islands are the only colony that get any considerable quantity of white pine and spruce anywhere except from Canada.

Jamaica imported 2,341,355 feet of white pine and 12,313,596 feet of pitch pine, the white pine being supplied chiefly by Canada, and the pitch pine by the United States.

It is evident that Canada practically monopolizes the West Indian market for the white pine and spruce, while the Southern States have the monopoly in pitch pine. If British Columbia Douglas fir can compete with the pitch pine from the Southern States, Canada may yet supply practically all the lumber that the British West Indies import.

An American business man located in Kingston, Jamaica, said: "A great deal of the pitch pine imported here from the Southern States is very defective. We would not use it in the United States; you would not use it in Canada. It is used in Jamaica because there is nothing to compete with it. I would like to see your British Columbia Douglas fir coming in here."

### The Currency System

In all the British West Indian colonies that have joined in the Preferential Agreement with Canada there is a mixed currency system of dollars, shillings and pence. The Royal Bank of Canada and the Colonial Bank issue five dollar notes in each colony where they have branches, and the Government of Trinidad issues a one dollar bill, but English silver coins and English pennies are used.

The use of one dollar and five dollar bills together with English coins as a currency makes it absolutely necessary to have a fixed rate of exchange, and throughout these colonies an English penny is always reckoned as two cents, an English shilling as 24 cents and an English pound as $4.80.

A Canadian or an American five dollar bill is worth $4.92 in these colonies. In some stores it will be accepted at its face value as a courtesy to visitors, but when the merchant deposits the Canadian or American five dollar bank note in a local bank he receives credit for $4.92. In any colony where the Colonial Bank or the Royal Bank of Canada have branches their five dollar bills are accepted everywhere at their face value because payment in gold may be demanded at any branch of these banks in the West Indies, whereas one cannot demand payment in gold in a West Indian colony for a note of a Canadian bank that has no branch there.

---

## South America Lumber Imports

Argentine coinage unit—the Peso (gold) equal to about 97 cents.

In 1912, Argentina imported among other wood goods, ash in the rough to the value of 83,000 pesos from the United States and Canada; oak in the rough, 394,000 pesos, from the United States; oak, dressed, 32,000 pesos from Belgium and the United States; white pine to the amount of 112,000 cubic meters, valued at 2,207,272 pesos, from the United States and Canada; Oregon pine, 939 cubic meters, valued at 13,148 pesos, from the United States; yellow pine in the rough, 528,803 cubic meters, valued at 8,460,852 pesos; yellow pine, dressed, 1 cubic meter, valued at 30,000 pesos, from the United States principally and Canada. Spruce pine in the rough 273,102 cubic meters worth 3,823,429 pesos, from the United States and Canada principally, and to a lesser extent from Sweden and Austria.

During 1913 wood pulp for the manufacture of paper, was imported into the Argentine to the extent of 31,992 metric tons, valued at 959,780 pesos, which was an increase of 361,435 pesos over the previous year; newsprint, 30,749 tons valued at 1,844,962 pesos, which was an increase over the previous year of 2,936 tons.

White pine showed a considerable decrease in imports as compared with the previous year. In 1913 the imports were 74,704 cubic meters, valued at 1,405,879 pesos, which was 800,000 pesos less than in 1912. This was due to the severe trade depression that the Republic in common with Uruguay and Brazil experienced. The imports of Oregon pine were practically nil. Yellow pine (pino de tea) were 570,529 c.m., worth 9,188,464 pesos, an increase of 667,612 pesos; yellow pine dressed, 2,235 c.m., valued at 53,640 pesos; spruce (pino spruce), 211,721 cubic meters, worth 2,964,094 pesos a decrease from the previous twelve-month of 859,000 pesos.

### Brazilian Lumber Markets

Brazil coinage unit—the milreis equal to about 33 cents.

The import trade of Brazil for 1912 with regard to lumber included pine lumber, 113,315 tons, valued at 8,556,258 milreis. About 80 per cent. of this pine is said to have originated in the United States. Wood pulp was imported to the amount of 6,118 tons, valued at 782,806 milreis, and wood, rough, sawed, planed, and veneered, 15,049 tons, worth 1,436,450 milreis. The lumbermen of the Maritime Provinces have been engaged in this traffic for so long that it is superfluous to advise them as to increasing their sales. They understand the busi-

**Ideal for the camp**

# KLIM

**(Spell it backward)**

"Klim" is a pure separated milk in powder form and is unexcelled for camp use for the following reasons:

It is easily, quickly and conveniently prepared. It has a pure natural milk flavor, just like fresh milk. "Klim" is not harmed by heat or freezing and will keep indefinitely, even after the tin is opened. "Klim" can be used for everything in place of liquid milk. It is one-third the cost of condensed milk.

Used in all the soldier camp kitchens from Victoria to Halifax. Packed for camp use especially in 10 lb. tins $2.00 each. 1 lb. makes one gallon of liquid. Large quantities special prices.

Write for free sample and full information.

ness thoroughly, and probably have a sale for most of their output, except in exceptionally poor years.

### The Chilean Lumber Market

Chile coinage unit—the peso equal to about 36 cents.

The prnicipal market on the west coast of South America is Chile, which absorbs much more than all the other Pacific Coast republics combined. The chief import is Oregon pine, which comes down usually in sailing vessels in full cargoes. White and sugar pine are also imported, and some oak and ash, but only in packages. Sailing vessels engaged in carrying lumber down the west cost, usually confine themselves to that trade, returning north in ballast. The round trip averages seven months.

The statistics available afford little information as to the possibilities of the market. The estimate of one large firm dealing in timber, for imports into Valparaiso alone was 20,000,000 feet for 1911, and 23,000,000 for the following year. In this Republic imported timber is not only used in the interiors of buildings, but also in the walls of many of the houses. Frame houses are quite commonly seen about Valparaiso. They have two qualities to recommend them, comparative cheapness, and suitability to earthquake countries. For beams Oregon pine is utilized, the sizes being 2 by 10, 2 by 12, 4 by 10, and 4 by 12.

### Market for British Columbia Products

For some reason British Columbia lumbermen do not appear to have cultivated extensive relations with South American importers. The field has been left to the Pacific Coast lumbermen of the United States and the trade is done through San Francisco brokers almost wholly. Occasional shipments do go down from Canada and doubtless these were more frequent in the past. The Hastings mill of the Brish Columbia Mills Timber and Trading Company, is well known, and importers in Chile and Peru speak highly of the treatment received from it. This firm is a shining example of the value of a good name in international trade. However, out of a list of 125 vessels chartered, loading or in the water, prepared recently by a well-known San Francisco broker, only two cargoes were shown as originating in British Columbia; the others were from Puget Sound or Columbia River ports.

Up to the present, Argentina has imported little Douglas fir, but conditions are changing, and in the future there is reason to believe that the Republic will look to the west cost of North America in a constantly increasing degree to supply her requirements of timber.

A partial list of importers in Brazil, Argentina, Chile and Peru will be gladly furnished to any of our readers who are interested.

Quebec spruce has the best name in the Argentine market for quality, after which comes the New Brunswick and Nova Scotia product. To a small extent it is used as a substitute for white pine, owing to its fine grain and freedom from knots. Quebec spruce is used for the architraves of windows and for skirting boards, whilst New Brunswick and Nova Scotia spruce are used for common floors, temporary partitions, cattle sheds and for corrales in the camp. A certain amount of West Virginia spruce is imported. Whilst the quality is not so highly regarded as that from Quebec, it is liked on account of its size, as it is possible to cut all 12-inch widths out of this timber, which is not the case with the Canadian product, and it has also been stated that the lower price of the Virginian spruce more than offsets the advantages of quality and texture of that from Quebec.

### Steamship Lines to Argentina

The principal steamship lines having direct services between New York and Argentina will undertake the forwarding of shipments, attend to transfer at New York, make up consular documents and clear merchandise through the customs. The vessels of these lines with the exception of those of the New York and South American Line sail under the British flag. They are as follows:—

American and Rio Plata Line.—21-24 State Street, New York. Regular service for Buenos Ayres, La Plata and Rosario. Two steamers per month.

Barber Line.—17 Battery Place, New York. Regular service, three steamers per month for La Plata, Buenos Ayres and Rosario with occasional sailings for Bahia Blanca.

Houston Line.—17 Battery Place, New York. Two steamers per month for Buenos Ayres, Rosario and La Plata.

Lamport and Holt Line.—Produce Exchange Building, New York. Two steamers per month for Buenos Ayres and Rosario.

Norton Line.—Produce Exchange Building, New York. Two steamers per month for Buenos Ayres and Rosario.

New York and Pacific Line.—Hanover Square, New York. One vessel per month for Bahia Blanca and Puerto Madryn on the way to the west coast of South America.

New York and South American Line.—11 Broadway, New York. One steamer per month for Bahia Blanca.

Prince Line.—100 Bridge Street, New York. Regular fortnightly service for Buenos Ayres and Rosario.

# Hand Forged Sager Axes

Home of Canadian-Warren Axe and Tool Company, Limited

## Material

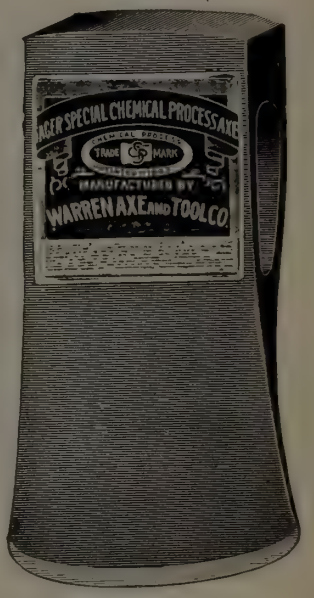
A special crucible steel is used in Sager axes. Each axe receives several hundred blows under the hammer. This thoroughly works and refines the steel imparting to it an unusual toughness.

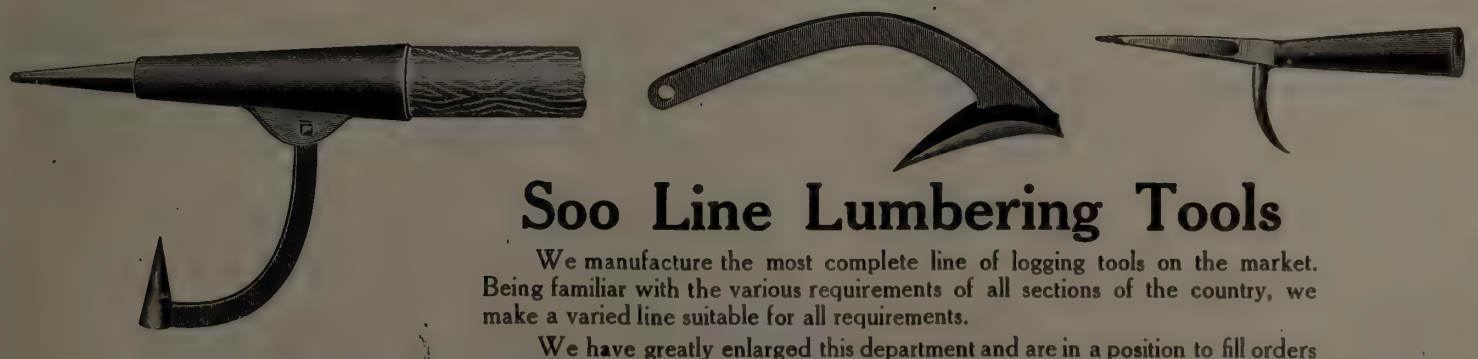
## Tempering

The Sager axe is tempered by a process which requires double the time required for ordinary run of product, but when finished it is right. We are the sole manufacturers in Canada of the Sager chemical process axes.

## Workmanship

Sager axes are hand forged and individually tempered. They are ground before tempering, avoiding all danger of drawing the temper. Sager axes are marketed in their natural color as they come from the temper—only dipped in a transparent lacquer.

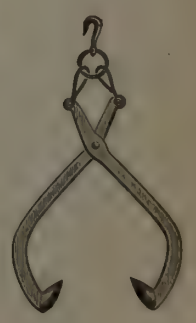




## Soo Line Lumbering Tools

We manufacture the most complete line of logging tools on the market. Being familiar with the various requirements of all sections of the country, we make a varied line suitable for all requirements.

We have greatly enlarged this department and are in a position to fill orders promptly and carefully. Write us.



## Canadian-Warren Axe & Tool Company, Limited

St. Catharines, Ontario, Canada

## British West Indies Customs Duty on Wood

Each of the various British West India Colonies have individual tariffs, which would take up a great amount of space to publish in detail. These tariffs are on file in the office of the Canada Lumberman and we will be pleased to furnish definite information in regard to any items in which our readers are interested. In the following Colonies a preferential tariff applies to goods from all British countries: St. Lucia, St. Vincent, Barbados, Grenada, St. Christopher-Nevis, Antigua, Montserrat, Dominica, Trinidad, Tobago and British Guiana.

## Argentine Republic Customs Duty on Wood

The tariff on wood entering the Argentine Republic includes the following:—

| | Rates of Duty |
|---|---|
| Casks, staves for casks, firewood | Free |
| Vehicles finished or not, with bodies and shafts in the rough for the same | 50% |
| Boxes, empty, for matches | 40% |
| Oak, cedar, spruce, white pine and resinous pine, unplaned | 15% |
| Fibre wood pulp for the manufacture of paper | 5% |
| All other wood | 25% |

## Cuba Customs Duty on Wood

The tariff on wood entering Cuba includes the following:—

| | Quantity | General Tariff $ cts. | Pref'tl. Tariff $ cts. |
|---|---|---|---|
| Staves | 1000 | .80 | .64 |
| Ordinary wood: | | | |
| (a) In boards, deals, rafters, beams, round wood, and timber for shipbuilding | Cu. Met. | .50 | .40 |
| (b) Planed or dovetailed, for boxes and flooring; broomsticks and cases wherein imported goods were packed | 100 kilogs | .20 | .16 |
| Fine wood for cabinetmakers: | | | |
| (a) In boards, deals, trunks, or logs | 100 kilogs | 1.50 | 1.20 |
| (b) Sawn in veneers | 100 kilogs | 2.19 | 1.75 |
| Coopers' wares: | | | |
| (a) Fitted together | 100 kilogs | .81 | .65 |
| (b) In shooks, also hoops and headings | 100 kilogs | .45 | .36 |
| Wood, cut for making hogsheads or casks for sugar or molasses | 100 kilogs | .07½ | .06 |
| Latticework and fencing | 100 kilogs | .75 | .60 |

Note:—The preferential tariff for Cuba applies only to goods of the United States.

## Imports Into Jamaica

The following table shows the quantity and value of lumber, etc., imported into Jamaica during 1913, and the average for four years ending 1913:—

| | | 1913 | Four Year Average |
|---|---|---|---|
| Wood, W.P. lumber | feet | 2,341,355 | 1,797,328 |
| | value | £17,560 | £13,230 |
| Wood, pitch pine | feet | 12,313,596 | 12,120,722 |
| | value | £86,195 | £84,845 |
| Wood, shingles | number | 2,252,340 | 1,573,156 |
| | value | £5,503 | £3,777 |

## Cuba's Imports

Cuba's imports from Canada during 1912 and 1913, included the following:—

| | Imports from Canada 1912 | Imports from Canada 1913 | Total Imports 1913 |
|---|---|---|---|
| Wood pulp and newsprint | $ 39,005 | $ 17,018 | $ 396,229 |
| Lumber (pine and spruce) | 259,864 | 243,172 | 2,992,123 |

## Metric Measurements of Length

In connection with several important export markets it is important for Canadians to be acquainted with the metric system of measuring length. The following table of equivalents will enable exporters to estimate according to metric measurement:

| | | | | |
|---|---|---|---|---|
| Metre | 1 | 39.370113 | 2.280843 | 1.0936143 |
| Decametre | 10 | ..... | 32.70743 | 10.936143 |
| Hectometre | 100 | ..... | 328.0743 | 109.36143 |
| Kilometre | 1000 | ..... | 3280.843 | 1093.6143 |
| Decimetre | 1/10 | 3.937011 | .3280843 | .10906143 |
| Centimetre | 1/100 | 3.937011 | .0328043 | .010936143 |
| Millimetre | 1/1000 | .03937011 | .003280843 | .0010936143 |

1 inch = 2.54 centimetres. 1 foot = .3048 of a metre. 1 yard = .914399 metre.

The Redcliff Land & Lumber Company are suing the firm of Alvo von Alvensleben, Limited, Vancouver, for the recovery of a payment on account of the sale of 21,117 acres of timberland on Vancouver Island. The purchase price of the property, which is in Newcastle, Nelson, and Alberni districts was $2,228,000, and it is claimed that there is $200,000 overdue. In default of payment the plaintiffs are asking for foreclosure.

# To Lumbermen and Contractors

Teas are high but there's no need for you to pay high prices, for the reason that we have anticipated your requirements, having secured a sufficient quantity of teas such as are required in the camps to enable us to offer you an opportunity of securing supplies at little or no advance over the old figures, although the market is at least five cents higher on your kinds than it was six months ago.

**Ask us for samples of the following—good, strong, serviceable quality teas.**

# News Briefs from B. C. Mills

Victoria, B.C., May 19th.—From reports received by the Hon. W. R. Ross, Minister of Lands for British Columbia, it appears that there is more activity in the lumbering industry at the present time than many people realize, particularly along the Coast. An interesting feature is the shipping of yellow pine from Vernon district to New York and the Eastern States, where it sells in competition with Eastern white pine. Box manufacture is also active in that district. Twenty-two out of twenty-nine sawmills will operate this season in the Okanagan, of which eighteen have already started up.

At Tete Jaune Cache a considerable quantity of special piling for Port Arthur has been shipped by the G. T. P., while at McBride work has been done on a provincial contract for 40,000 ties, of which only 5,000 were delivered owing to the short winter.

The Upper Fraser Lumber Company at Dome Creek has received some machinery for the new mill. The advent of mills in this district will provide settlers along the river with a market for much timber that would otherwise be burnt in land-clearing operations.

From Prince Rupert it is learned that increased activity in the fishing industry is providing a good market for boxes, the local mills supplying 6,000 a month. During the winter and spring there were operating four sawmills with a daily capacity of 80,000 feet; and one shingle mill, with a capacity of 20,000 feet. It is interesting to know that 120 hand-loggers are working in the Prince Rupert district at the present time.

Considerable shipments of cedar posts to the prairies are being made from Fernie.

In the Cranbrook district nearly 500 men are engaged in the woods and mills.

Clearing operations throughout the province appear to have been far in advance of recent years, and have been helped by the early spring and favorable weather. In the Vernon district the clearing this spring is reported to be greater than during the whole of the past five years. The heavy clearing of slash and other debris by settlers has certainly diminished the fire hazard, as well as aiding agricultural production. In this connection observers have been struck with the extra acreage being placed under cultivation this year and the great amount of settlement that has taken place along the P. G. E.

Practically no fires have escaped from settlers' clearing operations. Large areas of logging slash have been burned successfully this spring under the supervision or at the suggestion of the Forest Service, the Cranbrook, Tete Jaune and Nelson districts being especially noticeable for this excellent work. The C. P. R. and G. N. R. have been preparing for the coming season by burning off grass along their rights-of-way, while the G. T. P. has done similar work in this direction.

Rain has been general throughout the province, checking and extinguishing fires, and stimulating vegetation, which acts as a barrier against forest fires. The Hazelton, Lillooet and Fort George districts report the firest in those areas as being under control, thirteen outbreaks in the first named division having been fought by the G. T. P. Slash burning in the Cranbrook district continues, the logging operators being alive to the necessity of reducing one of the main fire hazards. For the time being the fire situation is pronounced safe, so far as green timber is concerned. Fires may continue to break out on cut-over lands or on old burns, but the extremely dangerous conditions which existed recently have passed away.

## The Christie Woodworking Company Limited

One of the progressive woodworking firms in the Maritime Provinces is The Christie Woodworking Company, Limited, of St. John, N.B., operating two of the largest plants in that city and employing upwards of one hundred men. The firm was established in 1865 by the late Alex. Christie, and was known as A. Christie & Company. Under this name they continued until 1885, when the business was taken over by the A. Christie Woodworking Company. In 1904 the company was incorporated. The business grew rapidly year by year until today the company are catering to trade all over the province. The planing mill, woodworking factory and head office, are situated on Erin Street, and the lumber yards and saw mill on City Road. The company make all kinds of interior finish and are equipped with fast feed matchers, band resaw and planers, so that they can specialize in dressing lumber in transit at the shortest notice. The officers of the company are Jas. Christie, President; M. A. Christie, Vice-President; and Chas. S. Christie, Secretary-Treasurer.

# "GLOBE" Card Recorders

## *Made in Canada*

FOR some time past there has been a growing demand for high grade Card Time Recorders at moderate prices. To meet this demand we have bent our efforts in this direction and have succeeded in placing on the market a Card Time Recorder which is not only low in price, but which is built to stand the hard usage a recorder of this description is subjected to.

"Made in Canada" is one big reason why this recorder is low in price, no duty to pay.

*More complete details of these Recorders will gladly be furnished upon request.*

### Machinery and Supplies—Austen Bros., Limited, Halifax

Austen Bros., Limited, Halifax, N.S., who have been in business since 1877, are well known to the lumbermen of Canada as the "Banner Machinery and Supply House" of the Maritime Provinces, and a firm which has shown the same careful and prompt attention to the smallest order as to the largest contract. Austen Bros., Limited, sell only such machinery and supplies as they know to be unsurpassed, and this insures the perfect satisfaction that their customers have had in dealing with this old reliable firm. After a successful career of over forty years, they have the pleasure of filling orders for the same customers who patronized them when they first began business. For all special enquiries they are ready to quote keen prices, and they use the word "Promptness" as their motto. Promptness applies to all their dealings and all their transactions. In fact their business is all done on strictly up-to-date business methods, and their watchword is "Quality First." The firm aim to fill all orders on the same day as they are received and to give an assurance of absolute satisfaction with every shipment. Lubricating oils, waste, and grease are among their specialties. Their advertisement, appearing elsewhere in this issue, will prove interesting to our readers.

### Waterproof Crayons for Lumbermen

The Zelnicker Crayon Works of St. Louis, U.S.A., manufacturers of crayons for all purposes, have perfected an indelible crayon in purple, wine and white, which is peculiarly adapted for marking wet and frozen lumber, logs, etc. The United States Government Forestry Service has adopted this crayon in the northwest. Their Zelnicker pure graphite enameled black crayons have great wearing qualities and are recommended where color is not an essential. These crayons are made in four grades, hard, extra hard, soft and extra soft. It is claimed that all Zelnicker lumber crayons are waterproof and their regular black and colors are standard with the largest mills in the United States and the Dominion.

### Locomotives and Machinery for Lumbermen

The Walter A. Zelnicker Supply Company, of St. Louis, U.S.A., is one of the oldest and best known firms dealing in new and used rails, locomotives, machinery, etc., besides handling a complete line of mill and logging-road supplies. Their bulletins of bargains, issued periodically, are eagerly sought after by mill men, who recognize their value. The next issue will be ready in June and will be sent free on request. This company make a specialty of storage tanks of all shapes and sizes. Their secretary and treasurer, Mr. H. J. Elson, has perfected a calibration curve for horizontal cylindrical tanks which may be obtained on application, gratis. Their Chicago office is in charge of Mr. Ed. Elson, with headquarters at Morrison Hotel.

### Old Time Brand of Axes for Lumbermen

The attention of our readers is directed to the advertisement of the Mann Axe & Tool Company, Limited, St. Stephen, N.B., who are showing one of their well-known "Old Time" Brand of axes, known as the "Michigan" pattern, made specially for Ontario lumbering conditions. This axe is hand made, of the highest grade steel, charcoal tempered, and every precaution is taken in the course of manufacture from the start to the finish. It is put out in fire blue finish. This is only one of many patterns put out by this company, who are so well and favorably known to the lumber trade throughout Canada. The Mann Axe & Tool Company are a branch of James H. Mann Company, of Lewiston, Pa., one of the largest axe manufacturers in the United States. Four years ago they decided to establish a branch in Canada to take care of their rapidly growing trade, and on account of the splendid water privileges in St. Stephen decided to establish there. Their excellent facilities place them in a position to supply axes in any quantity at a price which would appeal to the lumber trade.

### Pacific Lumber Inspection

The inspection of lumber for the foreign and domestic export trade of the Pacific Coast is governed by the grade usually shipped to the respective ports of different countries. The Pacific Lumber Inspection Bureau, of Seattle, Wash., cover the inspection of lumber in British Columbia and the States of Washington and Oregon. Certificates are issued in triplicate by the bureau, showing the grading and amount tallied. The certificates are sent to the buyer, seller and inspection bureau. Exporters who are in doubt as to the quality of lumber usually shipped to a foreign port mentioned in an enquiry can obtain definite information upon this subject from the bureau, the chief, or the district supervisor.

Mr. S. Max Kubelik, of Montreal, who was drowned in the Lusitania disaster, was interested in the newly formed Gulp Pulp and Lumber Company, Limited, Montreal. He was on his way to England in connection with Government contracts.

# EDGINGS

## Ontario

E. S. Hatch, St. Thomas, Ont., has commenced the construction of a planing mill to cost $5,000.

The John B. Smith & Sons' sawmills, Callander, Ont., have recently been equipped with an electric lighting system.

Henry Bartholomew, Vanessa, Ont., has commenced rebuilding his sawmill which was recently destroyed by fire. He will purchase new equipment.

The Mississaga River Improvement Company has secured supplementary letters patent increasing its capital stock from $5,000 to $40,000. The company's rights have been extended to sort and boom logs and timber of every description on the Mississaga River and in the mouth thereof.

The Rainy River Dredging Company, Limited, has been incorporated with head office at Fort William, Ont., and capital stock of $40,000. The incorporators include F. R. Morris, F. Babe and W. Walker, all of Fort William. Among other powers the company's charter includes that of carrying on business as lumbermen.

The Columbia Handle and Lumber Company, Limited, recently incorporated with head office at London, Ont., has an authorized capital of $100,000. The incorporators include F. G. Rumball, J. Stevely and W. H. Braddon, all of Toronto. The company is taking over the business heretofore carried on at London by the Columbia Handle and Lumber Company as co-partners.

Work has been commenced at Walkerville, Ont., upon the erection of a handle factory to cost $4,000, the owners and architects being Hartwell Bros., Chicago, Ill. The general contractors are the Williamson Construction Company, Walker Road, Walkerville, Ont. The building is to be one storey, frame construction, 60 x 90 ft. The company will be requiring woodworking machinery.

If anticipations are verified, the Abitibi Pulp and Paper Company, Iroquois Falls, Ont., will be turning out newsprint in the middle of June. Three machines are installed, and the fourth, of English manufacture, should be in operation by September. The capacity of the three machines is 150 tons per day, and of the four machines about 250 tons per day. Mr. F. Hanson, the president, states that contracts for the entire product of the mill for the first three months of operation have been closed.

John Piggott & Sons, whose planing factory at Windsor, Ont., was recently damaged by fire report that their heavy machinery was not damaged to any great extent and that the engine and boiler were not injured. The company started to rebuild at once and expected to be operating a portion of the mill that was not damaged within a week's time. None of the stock of lumber in the sheds or yard was damaged, and the store room in the mill was also saved. The company carried considerable insurance on the plant and stock and are not as yet able to state definitely what their loss will be over and above the insurance. They state however, that the indirect loss will be the heaviest item.

## Eastern Canada

Beauchemin & Gelinas, lumber dealers, Three Rivers, P.Q., have been dissolved.

Bourgeois & Cloutier, lumber dealers, Three Rivers, P.Q., have been registered.

La Cie Lariviere Limited, sash and door manufacturers, Roxton Falls, P.Q., have been dissolved.

A report from Truro, N.S., states that an extensive jam of logs has taken place above the falls in Economy River, the logs belonging to H. McLean and H. McKay.

The Lachute Shuttle Company, Lachute Mills, P.Q., are working day and night on an order for a million pick and other handles, placed by the British Government, for the overseas contingents.

The sawmill belonging to W. K. Baldwin, Baldwin's Mills, P. Q., was totally destroyed by fire. Mr. Baldwin will rebuild at once. The new mill will be of mill construction with shingle roof.

The latest information received from St. John, N.B., states that all the drives on the St. John River will be brought out without much trouble. The Nashwask drives are also coming out rapidly.

Timber lands in the vicinity of St. Martins, N.B., totalling about 4,000 acres, belonging to the estate of George McDonough, were sold at auction recently. The property was purchased by George R. McKean for $3,250.

Recent reports from Chatham, N.B., state that all the Miramichi drives, with the exception of James Robinson's drive on the Renous River have been safely brought out. The Partington Pulp & Paper Company's drive on the Bartholomew has been brought out with the exception of 500,000 feet

which had to be left at the headwaters. The Robinson drive on the Renous is the largest Miramichi drive, but favorable reports have been received in regard to its progress.

The last drive for Fraser Limited, Fredericton, N.B., under the direction of J. M. Scott, has been safely brought out, being about 2,000,000 feet on the Tay. Driving conditions in this district have been good and it is said that there will not be any drives hung up. About 7,000,000 feet have been brought out for Fraser Limited, in several small drives.

The Makamik Sawmill Company, Molesworth, P.Q., in the Pontiac district, are contemplating the erection of sawmills. The company was recently incorporated with capital stock of $20,000 to construct buildings, waterworks, etc., and to repair machinery. Among those interested are L. N. Boisclair, Princeville; J. B. Boisclair, St. Samuel de Horton; D. Lambert, Warwick; and L. E. Boisclair, Princeville.

The Belgo-Canadian Pulp and Paper Company, of Shawinigan Falls, P.Q., is now running at about 90 per cent. capacity in turning out newsprint, the contracts on hand providing sufficient work on this basis for about eighteen months. Mr. M. Biermans, the managing director, states that the company have a new machine awaiting shipment in England. Business with Australia is interferred with owing to lack of shipping facilities.

On the night of May 14 the sawmill and the mill for cutting up pulpwood of the Gres Falls Company, Three Rivers, P.Q., were destroyed by fire. The two mills adjoined one another and the fire having once gained a hold it was impossible to save either structure. Fortunately, the office and the lumber piled in the yards escaped. The property was insured, but the fire will mean an interruption to business, it having been intended to start sawing at an early date. The origin of the fire is unknown.

## Western Canada

Joseph Park, lumber and coal dealer, Rosebank, Man., has sold his business to Wm. Saunders.

The Wilton Shingle Company, Eburne, B.C., recently lost their shingle mill and its equipment by fire, the damage amounting to $10,000.

It is reported from Duncan, B.C., that the Empire Lumber Company is preparing to increase its logging capacity at Cowichan Lake from 50,000,000 feet to 80,000,000 feet per annum.

A contract for furnishing from 1,000,000 feet to 5,000,000 feet B. M., of lumber has been awarded by the Board of Control of Winnipeg, to T. D. Robinson & Sons, 258 Portage Avenue, Winnipeg.

The Russian ship Endymion, 1,282 tons, has been chartered by Heatley & Company to load lumber at British Columbia ports for Cape Town, South Africa, the rate being 120s. per thousand superficial feet, B. M.

The Vancouver Shingle Mill Company, Eburne, B.C., recently lost its main mill by fire. The dry kiln, boiler house and most of the lumber and shingles in the yard were saved. It is estimated that the loss amounted to about $20,000.

Sealed tenders are being received by the Minister of Lands of British Columbia, up to June 16th, for the purchase of license X405 to cut 6,868,000 feet of Douglas fir, cedar, hemlock, and balsam on the area adjoining T. S. X94, Mellin Lake, Range 1, Coast District. Five years will be allowed for removing the timber.

The lumber yards of the North West Lumber & Supply Company, Regina, Sask., were recently visited by a serious fire which caused damage to the extent of $25,000. In addition to the lumber in the yards, the fire destroyed a shed and a quantity of office equipment. The company had just built a new office and moved their equipment, but had stored their desks, filing cabinets, etc., in the shed which was destroyed. Very little damage was done to the office. The lumber yards belonged to Messrs. Smith Bros. and Wilson, local contractors, who report that the plant will be rebuilt immediately.

Imports of timber into Formosa from foreign countries during 1913 were valued at £64,780. From Japan the imports of timber into Formosa during 1913 were valued at £261,310.

Mr. Albert Doherty, lumber contractor, Lennoxville, P.Q., died recently at his home. Mr. Doherty who was well known in the district had been suffering for some time from injuries received by a fall on the sidewalk.

The Miramichi Lumber Company's drive of 1,000,000 feet on Cain's River, N.B., has been successfully brought out, but at latest reports the company's largest drive of 13,000,000 feet on the Taxis River was experiencing some difficulty.

A heavy run of ice in the south-west branch of the Miramichi River, during the last week in April broke some of the landings and resulted in a large number of logs being carried out to sea. The logs belonged to Messrs. D. J. Buckley, John Maloney, and the Miramichi Pulp Company.

# This Canadian Organization Best Serves the Interests of Canadian Woodworkers

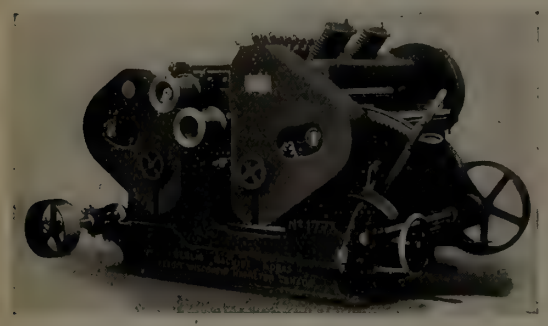
The Home of Berlin "Built in Canada" Machines, Hamilton, Ontario.

The town of Berlin, Wis., U. S. A. was the first location of this company and gave the concern its name—"Berlin" Machine Works.

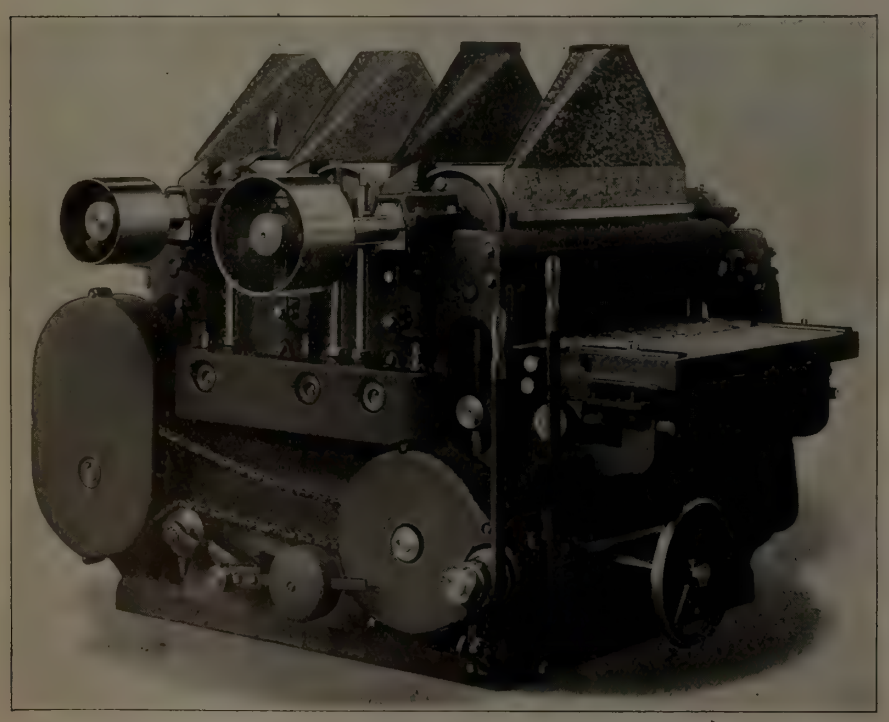
## Not Only Because

## "Berlin" Woodworking Machines are Made In Canada

**But because** they are made in the most **modern** woodworking-machine-building plant in the world. With its system, its specialized machinery, and its corps of expert designers, this plant stands behind every Berlin tool sold—a pledge of quality and satisfaction that has enabled every Berlin machine to make its own success.



The way of lowest surfacing costs, and of better, smoother results in general work where a wide range of material is run, is the way of this No. 177 General Utility Double Surfacer.



The rubber studded travelling bed solved your long standing problem of economical small stock sanding. And is an exclusive feature of this Berlin Endless-Bed Sander.

That this is appreciated by Canadian woodworkers is clearly shown in the growth of "Berlin" business throughout the Dominion. And employment results thereby to several hundred Canadian workmen through the operation of our plant.

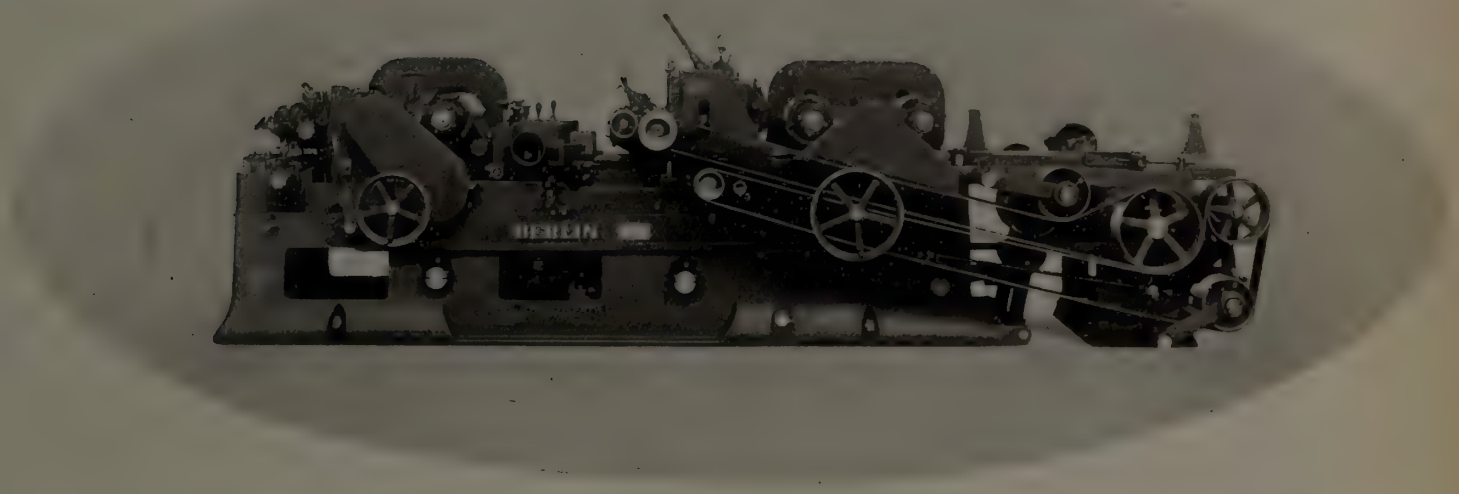
Our big general catalogue illustrates and describes our entire line and will prove valuable for reference. It will be forwarded to you absolutely free. But as these catalogues are expensive, we ask that you request it on your letterhead.

## Berlin Machine Works

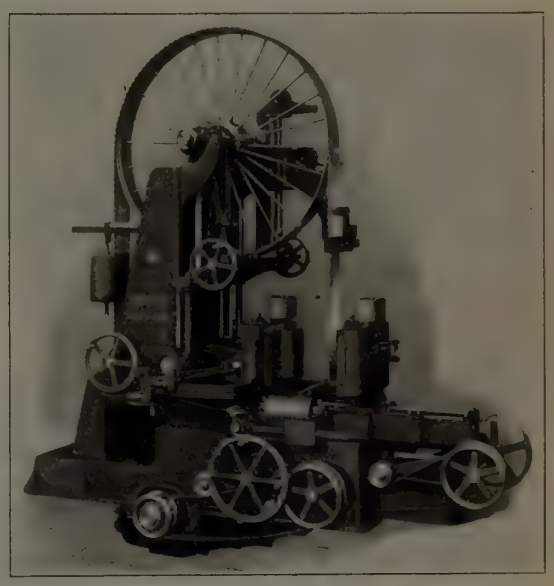
**Limited**

**Hamilton, Ont. - U. S. Plant, Beloit, Wis.**

# In "Berlin" Canadian-Built Machines We Offer You the Most Complete Line of Wood-working Equip-ment in the world



"Preferred lumber" making mills are running this Berlin New 91 Matcher throughout the Dominion.



This new type of Berlin Sawmill Resaw has a proven daily capacity of 150,000 feet.

Whatever rip or resawing you want to do, there's a "Berlin" especially adapted to your conditions.

## No Matter What Branch of the Industry You are in—

saw mill, planing mill or factory—put your proposition up to us. We can take care of your requirements and assure a profitable solution of your problem.

We are pioneers in the business, backed up by years of experience. This shows in the successful design and excellent efficiency of our machines. You'll be surprised to see how completely your practical point of view is built into these tools—it proves in their low operating and upkeep costs and in the better manufacture, better prices and more satisfied customers it brings.

A close knowledge of your producing units must show definitely the need of economies at certain points.

Put these points before us.

***We'll send you the required information—free upon request***

Messrs. PRESTON WOOD WORKING MACHINERY Co.

Preston, Ont.

Dear Sirs:-

We have had in operation, several of your Power Feed Rip-Saws for sometime, and they are producing excellent results.

To be candid, on an even price basis, we would prefer them to several types of Saws, which we have imported. In our opinion, in these rip-saws, you have succeeded in assembling design, workmanship and finish, that should commend them to anyone looking for a first class tool.

Our policy is "Canadian Trade for the Canadians", but it must be based on quality of goods. Even under present depressed business conditions, there is a big field in Canada for Manufacturers of Wood Working Tools, that will produce satisfactory results.

Yours very truly,

The SEAMAN, KENT COMPANY, Limited.

President.

## The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

## Labor Saved Is Time Saved

When to this is added increased durability we have the economy that naturally results from larger output and long service.

These are some of the strong points in favor of

# Disston Cross-Cut Saws

They are ground to a true taper all the way from cutting edge to an extra thin back. Being ground on lines that conform exactly to the breast of the saw, the blade is absolutely uniform in thickness throughout the entire length of the cutting edge. This special method of grinding gives the maximum amount of clearance with the minimum amount of set, without sacrificing elasticity and stiffness. You know that all these points are good points, and substantiate our claim that Disston Cross-cut saws are unexcelled.

You will find a lot of valuable information in our Cross-Cut Saw Booklet. Sent free on request.

CONVEYING
BELTING

A Typical LEVIATHAN Main Drive, installed at the Plant of The Riviere du Loup Pulp Co., 24 in. x 6 ply, 81 Feet in Length.

# Leviathan and Anaconda Belting Wherever Dependable Belts Are Needed

In all places where a sturdy, long-lived, all-round, satisfactory belt is required, whether for elevating or conveying materials or for transmitting power, **Leviathan** or **Anaconda** will meet the demands.

Time and again under conditions where other belts have "fallen down", **Leviathan** and **Anaconda** have "made good". There's a reason for this. May we tell you of it?

**Leviathan** will meet all ordinary conditions under which a belt is operated.

**Anaconda** is made to battle with the unusual conditions. It is highly resistive to acids, heat, cold, moisture, etc.

## Mobilization

Mobilization is getting ready for the battle—massing the strength of the nation on the firing line—putting the best troops forward.

Apply the system of mobilization to your belting problems. Put the best belts forward. Let them help you out of your belting troubles.

**Leviathan** and **Anaconda Belting** has been thoroughly tested. Both Leviathan and Anaconda have been on the firing line. Whether for conveying, elevating, or transmission, they can be of service to you. Prompt deliveries assured. Our engineering department is at your free disposal.

"The friends thou hast,
And their adoption tried,
Grapple them to thy soul
With hoops of steel."
Hamlet.

**WHEN POLONIUS** gave the above advice **TO LAERTES** he certainly expressed himself in such a manner that convinces one that he knew well the value of friends who have stood the test.

## GRAPPLE THEM to thy soul WITH HOOPS OF STEEL.

Tried and trusted friends should certainly be held and it applies both in men and material and is just as true in 1915 as in 1600, which was about the year when Hamlet was written by Shakespeare.

**MANY AN ENGINEER** during the last thirty years has borne testimony of the excellent service which our Babbitt Metals give.

HARRIS
HEAVY
PRESSURE
is known as
The Babbitt Metal
"Without a fault"

HARRIS
HEAVY
PRESSURE
For 30 years has
proved itself the Engineer's
friend

# Harris Heavy Pressure

**Has Stood the Test of Time, and is MADE IN CANADA**

It will give excellent service.
It will not crack or squeeze out.
It will run cool at any speed.
It is copper coated and copper hardened.
It is known as the Babbitt Metal without a fault.
It is the best for general machinery bearings.

Possessing these qualities makes it a true and tried friend to all Babbitt Metal users.

**IT WILL FILL THE BILL** in **95** cases out of **100, WHERE GENUINE BABBITT IS USED.**

If you have not tried it **ORDER A BOX FROM OUR NEAREST FACTORY.**

We have a reputation from coast to coast for manufacturing

**Goods that give excellent service.**

No matter what your requirements, we can supply you.

**All our BABBITT METALS are tested with a friction testing machine.**

If you have Babbitt troubles, ask our advice; we will be pleased to assist you, and give you the advantage of our 30 years' experience.

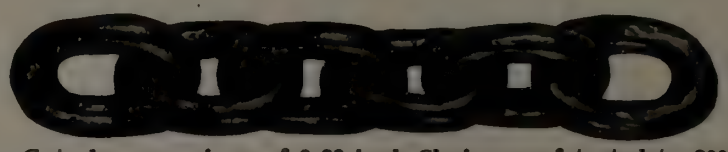
# "Ajax" Loading Chain

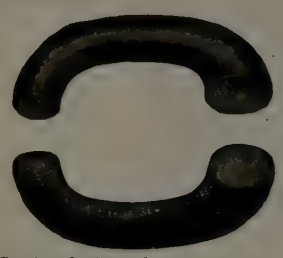
## Greatest Strength in the Smallest Chain



**Above Cut shows a piece of 9-32 inch Chain proof tested to 3000 lbs.**

**Showing the same pulled to destruction, breaking at 7,800 lbs.**
**(See how this Chain stretched before breaking.)**

**WELD:**



Sectional view showing comparative size of weld and chain.

The stock is overlapped on itself, carrying the lap around over half the length of the link and worked down under the hammer in such a way as to allow a swell in the weld end when finished, and giving a factor of safety not used in ordinary practice. This method of forming the link and building the weld makes the weld the strongest part of the link, as shown in above link which broke at the end opposite the weld end. In ordinary practice Chain invariably breaks in the weld, the lap not extending far enough around and not having sufficient work on the weld to insure equal strength of the material itself.

**STOCK:** Our long experience in the manufacture of Chain has taught us that a high grade Chain cannot be made of poor or cheap material, and we are using the best steel obtainable for this Chain, far superior to the Norway iron formerly used for making this grade of Chain, being higher in tensile, tougher and withstanding greater wear.

**INSPECTION:** We keep inspectors constantly inspecting the manufacture of the Chain at the fires, also prior to and after proof testing, to prevent any Chain leaving the factory which will not come up to our guarantee.

**TEST CERTIFICATE:** Every pound of this Chain is proof tested to strains shown in our catalogue and test certificate furnished. Breaks are made often enough to insure quality being maintained.

**GUARANTEE:** This Chain we will guarantee to pull stiff before breaking and every pound will be replaced which does not meet this guarantee. In other words, this is a guarantee that every weld is perfect and that the stock itself is uniform.

We would be glad to send you a few sample links that you might compare **Ajax** with what you are using and note the smoothness of the weld and closeness of the link.

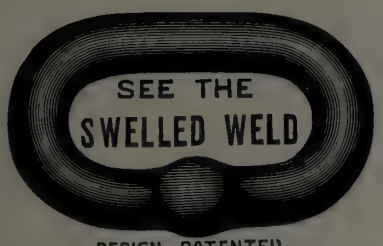
# "Dreadnaught" Steel Loading Chain

## Does not break at the weld

MADE IN CANADA

MADE IN CANADA

5-16 in. Dreadnaught Steel Loading Chain, pulled to stock break at 9230 lbs. proving the weld the strongest part of the link. Tested at Syracuse University September 27, 1912



DESIGN PATENTED

Note the increased material at the weld, strengthening the only possible point of weakness, by the addition of 25% more stock and thereby adding 25% more strength. In our chain the weld is actually the strongest part of the link.

DESIGN PATENTED

The strength of a chain is that of its weakest link, therefore, a chain for loading purposes is required to have all links perfectly welded and of uniform strength. Our chain is formed and welded on automatic machines, with pressure and current so regulated to give each weld exactly the proper amount to assure a perfect joint.

The material used in the manufacture of Dreadnaught Steel Loading Chain is the highest grade of steel, made to special analysis to meet our requirements. Samples of chain are constantly being taken from the welders and tested to destruction. Unless samples show a stock break, that run of chain is rejected. Every pound of chain is actually proof tested before being shipped, this test being higher than the safe working load.

All chain is sold under our absolute guarantee of weld perfection, with replacement free of charge if it breaks at the weld.

Combined tensile and distortion test, proving weld perfection.

T-BAR HOOK AND LONG END LINK

# Province of Quebec

## Timber Lands

License or permission to cut timber on public lands in this Province is acquired at public auction, after due notice has been given, subject to a yearly ground rent of $5 per square mile, and is renewable annually, provided the licensee shall have complied with the regulations.

The timber cut in virtue of such license is subject to a tariff of dues fixed by order in council.

The present rate of ground rent and tariff dues shall not be increased until the 1st of September, 1920.

Licensees are forbidden to cut on Crown lands trees less than a fixed diameter.

The Regulations also provide that all timber cut on Crown lands must be manufactured in Canada.

In the event of a licensee wishing to transfer his rights, he is at liberty to do so under certain conditions, namely, the paying of a fee of $4 per square mile.

There are at present time about 75,000 square miles of forest lands under license and over 150,000 miles in the possession of the Crown.

## Water Powers

To obtain authorization for the utilization of a Water-Power in the Province of Quebec, application should be made to the Honourable Minister of Lands and Forests.

Water-Falls capable of developing over 200 H.P. are granted under emphyteutic leases, the conditions of which are upon the following lines:

1.—Duration of the lease, from 25 to 99 years, according to the importance of the water-power and to the amount of capital required for its development.

2.—Payment of a yearly rental which does not vary during the term of the lease, for the land granted, counting from the date when the contract was signed.

3.—An additional yearly charge of from 10 to 35 cents per H.P. developed according to the geographical situation of the site of the water-power; such charge being payable from the time the power is produced.

4.—The above charge is subject to revision every 21 years counting from the signing of the contract.

5.—Delay of 2 years for beginning works and 2 further years for producing power.

6.—The lessee to make a deposit in money or in securities as a guarantee of good faith of the carrying out of the contract. Such deposit may be forfeited if the conditions are not fulfilled; but it may be repaid after a certain time, in the contrary case.

7.—Lastly, the grantee must submit plans of his works, mills, etc., to the Department previous to their installation and when such installation is completed, he must keep the Department informed as to the quantity of power produced.

# Let us show you how to Save Money on your Exhaust System

To reduce costs and save money your Exhaust System should be 100% efficient. You should get full value for every dollar spent for power. Our system gives service and reduces cost because it is properly installed and because

## Our "Foster" Blower

is skillfuly designed and strongly constructed. Our special "Foster" Sawmill Blower will blow your green sawdust any distance. Write us about your exhaust system troubles. We remodel and install Blower Systems that save you money. Let us prove it.

## Toronto Blower Company

**156 Duke Street, Toronto**

# Reduce Your Belting Expense

***Reasons Why***

**The "Camel Hair" Belting**

**as a power transmitter is cheapest**

**BECAUSE!** It lasts longer than any other belt on the market.
**BECAUSE!** It slips just one-half that of any other belting.
**BECAUSE!** It will run equally well in damp, wet or a dry atmosphere.
**BECAUSE!** It is less affected by acid fumes and high temperatures than any other belting.
**BECAUSE!** It is uniform in thickness and runs true.
**BECAUSE!** Of its great strength —almost twice that of best oak tanned double leather.
**BECAUSE!** It requires much less attention than other styles of belting
**BECAUSE!** The stretch comes out quickly and after taking up once or twice (according to load and nature of run) requires little or no more attention.
**BECAUSE!** It transmits more power than any other belting.

**and**

## Beware of Imitations

**by using**

"CAMEL HAIR" "CAMEL" BRAND TRADE MARK REG. BELTING

# Conveyor Chains

## For Lumbermen

WE make them from carefully-selected iron, and every link is guaranteed ***strictly hand-made***—not the inferior machine-made.

The point is worthy of special emphasis.

We make the chains according to any dimensions desired, guarantee splendid workmanship; uniformity; dependability.

Prices are the lowest possible for the class of work we furnish, and Quality above criticism.

Let us quote for your needs.

**Send for catalogue giving estimated weights of various sizes of chain; prove test; breaking, straining and safe-working loads, and giving hints regarding the care of chain which will prolong a chain's usefulness.**

## Woodhouse Chain Works

*P.O. Box 525* **TRENTON, N.J.**

# INDUSTRIAL LOCOMOTIVES

**The designs of our small locomotives are the result of wide experience.**

**All details are accurately finished to standard gauges and are absolutely interchangeable on all locomotives of the same class and size.**

**This cuts out long delays when parts wear out, as parts liable to wear can be kept on hand or shipped promptly from our works.**

# MONTREAL LOCOMOTIVE WORKS, LIMITED

MANUFACTURING WOODWORKING
**Machine Knives, Circular Cutters and Mortise Chisel**

**The Belt for Direct Drives**

SCANDINAVIA BELTING — TORONTO

For direct drives where you do not need an endless belt, this is the article to use.

The lasting qualities are good and the cost is low.

**FEDERAL ENGINEERING Co.**
LIMITED
TORONTO AND MONTREAL

**This engine is 13½ ins. x 18 ins. and weighs 35 tons.**

The knowledge and experience of fifty years in locomotive designing and construction is what you get in our Logging locomotives. They are specially constructed for logging operations and will stand up to the severe service in which they are expected to run. Oil or coal burning.

They are as carefully designed and built as our 200 ton locomotives. Repair parts may always be obtained on the shortest notice.

**Grey Iron Castings—any size or shape—ordinary or intricate—made promptly. New foundry, splendidly equipped. We would be pleased to quote on castings—singly or by contract. We also make drop forgings of all descriptions.**

**MAY WE SEND YOU SPECIFICATIONS?**

OUR long experience with the particular requirements of the Lumber Industry of Canada places us in a position to give you exactly what you require for your particular work.

We have lately opened a branch at Hull, Que., where a full line of cross-cut saws, bits, holders, etc. is carried. A fully equipped repair department is in connection for the convenience of our many customers in that section of the country.

Our Vancouver Branch is similarly equipped.

You are assured *Prompt Attention* and *Immediate Delivery.*

# The Power of "A Want Ad."

When you have something to sell that another is likely to want, or if you want something, a sure way to get in touch with your party is through a "want ad." This class of advertising the world over is a rapid and positive means of finding your man.

If you have any wants in the lumber business the quickest and most inexpensive way to satisfy them is by advertising in the **Wanted and For Sale Department** of the Canada Lumberman and Woodworker.

Twice a month "the paper with the green cover" brings together buyers and sellers of lumber and machinery from all the principal lumbering centres of Canada and the United States. By covering this wide though specialized field, waste circulation for advertisers has been eliminated.

For quick and satisfactory results, get your advertisement in the **Wanted and For Sale Department** of the

# 50% or 90% Which?

MANY mechanics are less than 50% efficient in the use of files. In the mistaken belief that they're "saving money for the firm", they use their files too long. They try to do good work with files that long since passed the "useful point."

They are only 50% efficient.

But if they took good care to discard each file when it reached the "lower efficiency" point, they would be more efficient in using files. They would accomplish more and better work—in less time—and at a lower filing-cost, that would pay you an extra profit over the cost of files.

Make your men more efficient. See that they promptly discard all worn files. And in the interest of **maximum** efficiency, furnish them with the "Famous Five."

**KEARNEY & FOOT**
**GREAT WESTERN**
**AMERICAN**
**ARCADE**
**GLOBE**
**(Made In Canada)**

World-Standard for 50 years. Produced in 5 great plants—60,000,000 a year. Yet every manufacturing process—from furnace to file—controlled by us. Every file carefully inspected—and put to exacting tests.

Solely on the strength of superior service, they hold 90% of Canada's file trade. This fact speaks for itself.

*Over 4000 different patterns—the RIGHT file for EVERY use. Let us send you "File Filosphy" and our Catalog.*

## The Best in 1850
## The Best in 1914

Slicer

Lathe

In this age of specialization only those firms of keen observation and untiring effort can hope to win success in any one line. Our entire efforts for 64 years have been spent upon making Coe Veneer Machinery the best possible equipment for cutting, slicing, clipping, wringing, sawing, drying, stamping or producing veneer from any kind of lumber.

With the rapidly increasing demand for lumber and the rapidly dwindling supply, the use of veneer products must greatly increase.

If you are in the market for veneer equipment we will be pleased to hear from you. The many and varied Coe plants now in successful operation are proof that we can design and equip a plant to suit your conditions.

# Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

# Timber Permits

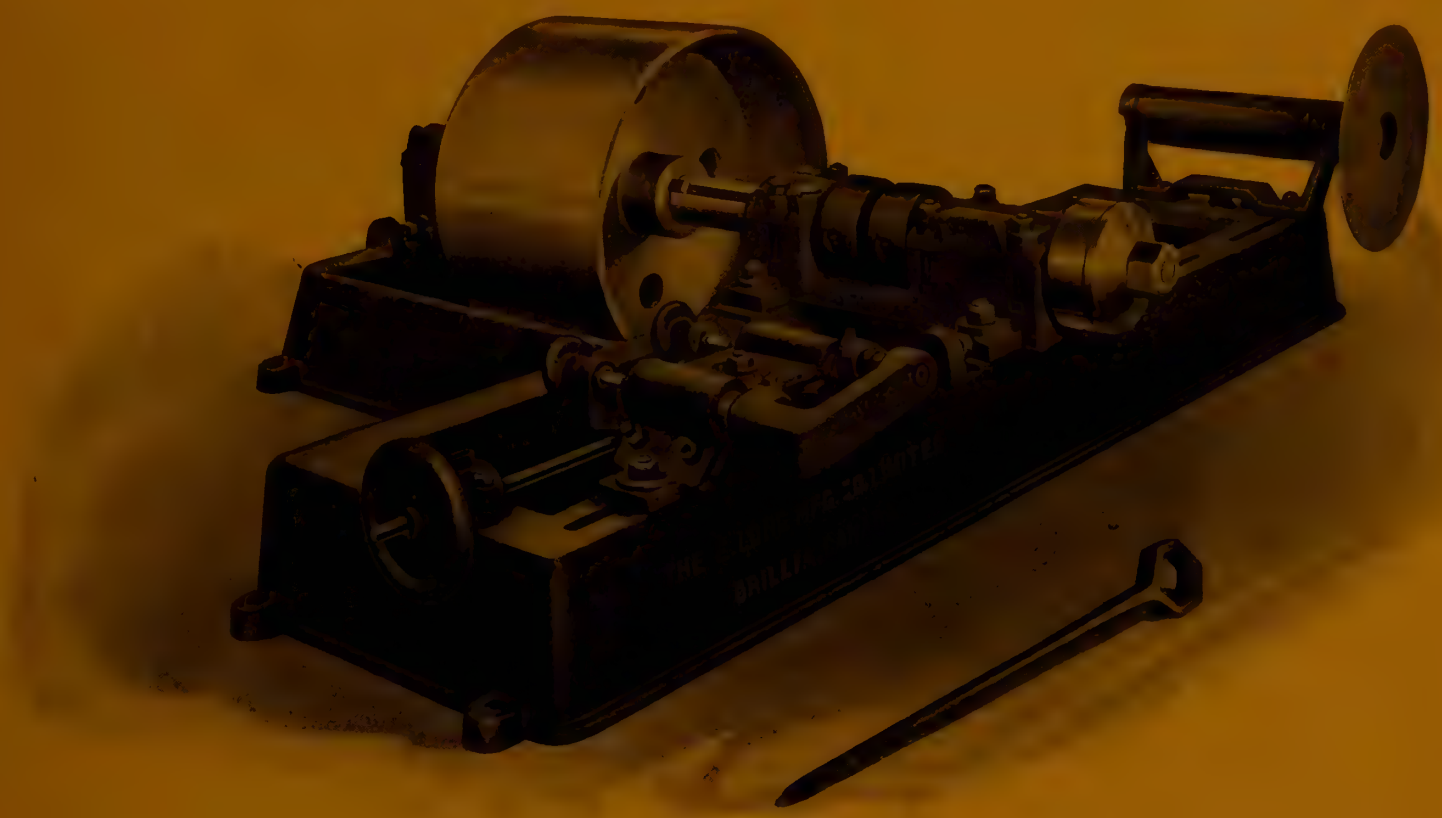
Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

**W. W. Cory,**

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

# What Do You Expect of Saw Mill Machinery?

You expect rapid and accurate production of course, but have you laid sufficient stress on the "KEEP GOING" quality.



You can't tell what is apt to happen to mill machinery; in the way of heavy and sudden stresses; except by experience.

Highly specialized experience has enabled us to embody in our machinery those "keep going" elements that distinguish "Long" machines from others of supposedly similar design.

***"Machines that meet emergencies."***

# LONG, ORILLIA

THE E. LONG MANUFACTURING CO. SAW MILL MACHINERY ORILLIA, CANADA

# It is in *simplicity*, as much as in *weight*, that much of "Long Quality" lies

Few parts mean little wear, easy access and consequently better attention.

Machines that are easiest understood are best taken care of—get the best chance to make good.

Our designs take full advantage of these points, and this principle has been followed, while at the same time adding all those new and modern devices that 1915 production of lumber makes necessary.

## The E. Long Mfg. Co. Ltd., Orillia, Canada

"Leather like gold has no substitute."

# Belting Students For 40 Years

For nearly forty years we have been close students of leather, its tanning and manufacture into belting.

As a result of our experience we are able to offer "AMPHIBIA" — a perfect leather belting, absolutley water-proof and impervious to water and oil.

"AMPHIBIA" belting is pliable and firm, with a minimum of stretch and a maximum tensile strength and durability.

"AMPHIBIA" belting is particularly suited to the difficult runs in saw mills, pulp mills, veneer plants and other industries where wet or green lumber is handled.

When ordering state where the belt is to run.

## To the Owner of Timber Lands

Far sighted owners of timber lands should take advantage of the times incident to the European wars, and prepare themselves for the day when the demand for timber is suddenly thrust upon them. This is certain to come at no distant day. Therefore cultivate a closer acquaintance with your holdings, and the best method of marketing them. Let us prepare the way for you. Remember, we not only report on the property, but assist in marketing the bond issue when necessary. Send for our booklet.

# ONTARIO
## Canada's Banner Province

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

| | |
|---|---|
| Pine production, | 905,442,000 ft. B.M. |
| Pulpwood, | 246,282 cords. |
| Railway Ties, | 5,704,459. |

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

# The Steam Tension Band Mill

It is called the steam tension mill because the tension is maintained by steam—the most sensitive form of tensioning which has been devised.

The result of this is a great saving in saws—**several users of the machine have run through an entire season without cracking a single saw.**

But in addition to raising and lowering the top wheel by steam, there is a separate cylinder for operating the top guide, and these two cylinders make ours an entirely steam-operated mill, and, therefore, exceptionally fast.

It is made with 8 ft., 9 ft. and 10 ft. wheels, and will stand thorough investigation.

Write for bulletin and list of users.

# Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

**We have the following Sawmill Machinery for sale:**

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

## FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Automatic Machine for circular saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

## POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Wood Machine for 16-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

## Wholesalers Who Sell to Consumers

Elsewhere in this issue we have published a number of interesting letters received from retail lumbermen in many parts of Ontario, in response to a circular which we sent out recently. The point of interest in these letters relates to the situation brought about by some of the wholesalers who have been in the habit of giving retailers a raw deal by hunting up their customers, contractors, farmers, carpenters, etc., and selling to them at as low prices as they sell to the retailers. This evil is always with us. It is not confined simply to the retailers and wholesalers of lumber. It can be found in connection with every line of business activity, and there is only one way of reducing it to its least harmful proportions. That way is by co-operation on the part of those who are injured.

We have been, we confess, a little surprised at the extent of the trouble which is revealed by the letters we have received. We had understood that this evil existed, but thought that it was of much smaller proportions than it seems to be. We have heard many of the better class of wholesalers discuss the matter and say that they would be glad to see the unfair wholesaler eliminated, but they have all agreed that the remedy lies entirely in the hands of the retailer. With this view we agree fully. The unscrupulous merchant, no matter to what class he belongs, cannot be brought to time by those who are engaged in the same line of business. The only thing that can affect him is co-operation on the part, either of those to whom he sells, or of those from whom he buys. As to the latter, there is no reasonable expectation of improvement under existing industrial conditions. As to co-operation among the retailers, the proposition is entirely feasible and holds out promise of good results. Briefly, what is wanted is a series of distinct local retail lumbermen's associations, organized for the chief purpose of agreeing not to purchase stock from such wholesalers as are known to be selling to legitimate customers of the retailers. We do not believe that a general association for the province would be practical in this connection, although the various local associations might combine subsequently into a federation of associations for the purpose of standardizing their methods of work, if this were found to be desirable. The local associations could do a great deal. They could make the lot of the unscroupulous wholesaler extremely unpleasant and compel him to abandon the trade or reform his methods, and they could make the lot of the fair wholesaler much more pleasant than it is. In addition to this othey could deal with many other less important problems in which all the retailers of the district are mutually interested.

We hope that this matter will not be allowed to remain where it is. Many good suggestions of this sort are brought up and discussed for a time and then allowed to pass without anything being accomplished, largely because the right man does not appear on the scene to push them towards effective completion. In this case we will be glad to see a number of local organizations spring up, and we will gladly do whatever we can to assist, by giving the matter publicity. Those who have been giving the question their thought should correspond with one another and arrange for local meetings to discuss the subject, and if possible to put the plan into operation at an early date. We hope that we may be able to report some interesting progress in this connection in an early issue and that those who are taking an active interest will let us hear from them as frequently as possible, sending us reports of their proceedings and asking us for our own opinions if they think we can be of assistance to them.

## Collection or Extension—The Promisory Note Problem

In connection with the management of credits by retail and wholesale lumbermen there is room for much reform, but the man who can indicate the direction of the reform and devise a plan for putting it into effect is so rare and valuable that very few lumber firms can afford to employ him. One would think that it was quite a simple matter to get hold of the money of a man who has gone into a lumber office and given an order for stock. He has, to all intents and purposes, given his word of honor that within a short space of time the money will be forthcoming, but unfortunately lumbermen have not found that the thing works out quite so simply. They have to spend untold hours and a great deal of money in getting from their customers a considerable portion of the money which the customers owe to them. This points to something wrong in the business methods of lumbermen. If this were not the case they would be getting better results than they are. One may say that the same thing is true in every other line of business, but this statement will not stand investigation, for there are many notable lines of business which have tightened up their credit management and brought about a revolution in their business methods. Why should not the same thing be done in the lumber business?

Most editors of lumber trade journals have all along had some such idea as this in their minds, but have seldom come across very definite cases where the remedy has been worked out and put into successful practice. It was with a little feeling of pride, therefore, that a few days ago we heard the very idea that we have been nursing along privately, and to some extent publicly, brought forward by Mr. J. B. Reid at a meeting of the Lumbermen's Section of the Toronto Board of Trade. In brief, Mr. Reid's proposal was that lumbermen—wholesalers and retailers alike—should stiffen up their backs and say to their customers in future that they must pay 50 per cent. upon their notes when they mature. We felt that the trouble had been solved so far as Toronto was concerned and we waited confidently to see Mr. Reid's motion upon the point unanimously carried.

It is one thing, however, to tell a man that he must pay 50 per cent. at least, when his note falls due, and it is another thing to get your hands upon the 50 per cent. at the end of that period. The debtor comes along with such credible stories as to his present inability to pay and convinces one so definitely that he will be able to pay everything a little later on, that the lumberman lets him run along a little more and the mischief is done; for, the customer has found the lumberman easy and trims his sails accordingly for the next meeting. Many lines of business have been able to turn their affairs over from a credit to a cash basis to very great advantage. We do

not say that this is advisable or possible in connection with the lumber trade, but a near approach to it has been made in some notable instances and so long as the lumber trade in general continues to let the financial end of its affairs be dictated by its customers there will be trouble.

While it is one thing to tell a man that he must pay 50 per cent. upon the maturity of his note and another thing to get hold of the 50 per cent., it is not such a difficult matter to say to that man when he refuses to pay the 50 per cent. that he can have no more of your lumber. It requires a stiff bit of backbone, but it can be done, and if the majority of those in the trade in Toronto, or in any other city or district, will co-operate upon such a plan they will get results, we believe, quickly. The real trouble is that such a step is a difficult one to take unaided. It is no use telling a man that he cannot have any more of your lumber unless he pays 50 per cent. of the amount owing on previous orders, because he will immediately walk over to another yard or another wholesaler and favor him with his trade. The problem is one of co-operation, and similar problems have been solved time and again by co-operation such as Mr. Reid suggested in his motion. We do not wish to commit ourselves as of the opinion that Mr. Reid's suggestion is the best or the only way of meeting the situation. We simply wish to record our conviction that the problem is one which can be solved.

No such plan can be crystalized into a hard and fast rule. It would be necessary upon occasions to give lenient terms to men who are for the time being unable to pay the 50 per cent. This would be a matter for individual discretion, for the lumberman would have reason to feel sure that the customer would pay before very long. It would be folly to endanger the whole amount of such a man's indebtedness, to say nothing of his future valuable custom, by standing out rigidly for the full amount, or for the 50 per cent. But, as a general rule, we would like to have someone tell us why it would be difficult to refuse a man's custom if he made a practice of paying only a fraction of the 50 per cent. when his notes fell due.

If everyone insisted upon the same rule the result would be a great and everlasting boom, for those whose custom was worthless would be squeezed out, and those who were left would soon be paying their notes regularly. Then the situation that Mr. Reid is aiming at would be brought about, for the sound retailers would find their hands strengthened and the unsound ones would cease to exist. The wholesaler's business life would be sweetened to a remarkable extent. Incidentally some retailers and some lumber customers who are doing business upon an unsound basis would see the error of their ways and reform. We hope that there will be an extensive discussion upon Mr. Reid's motion and that some definite steps will result.

# A Square Peg in a Round Hole

Two of the chief factors which have assisted in the modern development of systematic methods in every line of business activity, are trade associations and trade journals. We do not say this by way of patting our own backs, but by way of introduction for a few ideas which we have been considering during the past several weeks. Although these facts are so self-evident that few people would venture to deny them in public, we occasionally come across men who are disposed to express their disbelief in them privately when they think they can get away with the statement. As to the trade journals, their position is so well established that there is no question of "getting in under our skin." The trade journal is a power in the industrial world and no amount of criticism can make it otherwise. The trade association is in the same class as an industrial factor. Both are working for the same ends and their interests are mutual. The last person in the world to utter a criticism against trade journals should be—one would expect—a trade association officer of responsibility. We feel certain that the last people in the world to say anything derogatory of the work of trade associations would be the trade journals.

It is only a few weeks ago, however, that a case came to our attention which we would like our readers to think over. We do not care whether any of them write us a letter about the matter or not. We think we understand our own position well enough without needing to care whether one or two people do not understand us; but we would like our readers to think over the case of a prominent official of a lumber association who seems to have become so deeply set in a rut that he does not know what is going on in the world round about him. There are, comparatively speaking, so few associations of lumbermen in Canada that we have hesistated in referring to this matter for fear of giving any false impression as to its origin. We have concluded, however, that it is such an important instance of a peculiar attitude of mind which occasionally crops up, and which is sadly out of place under modern business conditions, that we think it is something in the nature of a duty to outline the facts, feeling sure that the other association officers in Canada and the trade in general will not come to any wrong conclusions in regard to the personality of the association officer in question.

We will put the matter as briefly as we can. Not long ago a lumberman of long experience and high standing, who contributes occasional articles to these columns, wished to write an article regarding a particular feature of the trade in which he knew that a great deal of interest was being taken. As a source of information he thought of the lumber association in question and called at its office. There could be no question that if the officer of the association was efficient he would be full of information upon this subject. Judge of our contributor's surprise, therefore, when, instead of assistance he met with discouragement. What he wanted was simply facts and figures regarding a certain feature of the lumber trade which this officer should have had in his possession and which he should have been only too glad to hand out, as their publication would have assisted in increasing the trade of the members of that association. The officer, however, to quote our contributor, "straightened himself back in his chair, threw out his chest, and sought to throw cold water upon the efforts of the Canada Lumberman" and its contributor, in trying to put before the lumbermen of Canada some pertinent facts regarding their business. There might have been some particular reason, our contributor imagined, for the association officer not desiring to hand out this special information, but when he went further and said that he did not believe in trade journals, and that any effort our contributor might make to prepare the article in question for publication would be just so much time wasted. The visitor was surprised beyond measure. The lumbermen were fully awake as to what should be done, continued the association officer, without any articles being written upon the subject, and much more to the same effect.

Now the truth of the matter is that lumbermen themselves, in all parts of Canada, have admitted in public and in private, times without number, that upon this particular subject—the development of our export trade—they have not been fully awake, and that while they have slept, their neighbors in the United States have been securing a strangle-hold upon the trade. It was our desire to put the matter before them in every light, and the association officer in taking such an absurd position was doing something which he would never have had the nerve to do in public. If his directors knew of his doing so they would not be long in coming to the conclusion that he was a square peg in a round hole.

Such men, with such ideas, have been responsible for the lumber trade having to fly the flag of distress at top mast today. Our contributor was inclined to tell the officer so, but restrained himself, telling him simply the same thing in less disagreeable terms and smoothing him down a little before he left, with an appointment for a later date when the official "would see" whether he could give him a little of the information he desired. Our own inclination would have been to tell the officer a great deal more than our contributor did. By way of relieving himself, however, the latter sent us a letter concluding with the following, which puts the matter pretty clearly and briefly:—"The fact of the matter is that there are a bunch of such fellows at the head of the lumber business, who can peddle any amount of hot air, and they think they are very clever, and so they are, in a way. But take them out amongst lumber and they are lost.

Such is life in the lumber business here, although it is little short of disastrous."

As we have said already, we do not wish to leave an impression that anything has got in "under our skin." After many years of editorial work our skin has become tough enough to stand this kind of thing three times a day, but we cannot avoid a feeling of regret that so complete a failure to grasp the true values of things should be shown by a man high in authority in the councils of the lumber trade. It is nothing short of fatal to the interests of the trade that this should be the case. We are inclined to take a little more lenient view of the matter perhaps than our contributor, and to think that something "had got under the skin" of this particular association officer upon the morning when our contributor was unfortunate enough to call upon him, and that the opinions he expressed were not really his convictions. We do not believe there is another association officer in the country who would think so little of himself as to express such opinions. We know that these views are not held by the trade in general. In fact we are very much in doubt whether they are held by anyone outside of the officer in question, who, we hope, has seen his mistake and tried to make amends for it long before this.

# Export Markets Must Be Fought For

The energetic campaign which the Hon. William R. Ross, Minister of Lands for British Columbia, is undertaking for the development and extension of the export lumber trade of British Columbia, a campaign which already is attaining important results, as evidenced by recent orders from the British Admiralty, from Australia and India, is being watched with much anticipation in the United States. Under the head of "International Rivalry in Export Lumber Trade," the American Lumberman of Chicago devotes a column and a half to the subject, and warns United States mills that they must be careful "lest they lose their advantage of long establishment in the foreign trade and of their present superior position." The American Lumberman, contrasting the work being done by the Hon. W. R. Ross to promote the lumbering industry of British Columbia, with the attitude of the United States Government, says, "Unfortunately, the Government of the United States does not help its citizens, who need to take special measures to promote their former business. The new shipping law, or "Seaman's Bill," as it is called, promises to make more expensive the operation of the freighters from American ports than it has been in the past, and, since the bill applies not merely to the coastwise trade, but to all foreign business, it will tend to keep foreign vessels away from American ports. However, lumber exporters of the United States are moving to hold their foreign business and to extend it by closer co-operation than they have ventured to undertake in the past."

The American Lumberman, in its article following upon a reference to the aggressive policy of Hon. W. R. Ross for the extension of the lumber trade of British Columbia, says: "From an outside standpoint the situation which British Columbia millmen consider prejudicial to their interest appears to be due partly to historic conditions over which they have little control, and partly to their own laches. The lumber industry on the Pacific Coast began about 1850, and soon became more than a local or domestic interest, being extended by means of export to other countries. California, with its redwood and pines, long ago developed something of an export trade, and soon after the establishment of the industry in that State the lumbermen and timber owners of California went north and began to develop in water-borne traffic the fir and spruce resources of Washington and Oregon. Washington, with its many harbors and ports, was at first the more attractive, and there are heavy operations on Puget Sound and Grays Harbor that had their beginnings forty, fifty or sixty years ago. So far as shipment by water is concerned, the lumber industry of Washington is old, and some of the interests that established themselves fifty or sixty years ago on Puget Sound are still cutting chiefly for the water-borne trade, whether coastwise or export.

"During this long period they established foreign connections of value; they built their own fleets, and some of them still have a dozen or more vessels which on occasion can serve them in the export trade as well as the coastwise. It was ten to twenty years after the industry was well established on Puget Sound that British Columbia lumber began to be developed. Therefore the States had the advantage over the province of an earlier establishment in the export business and long and friendly acquaintance in the foreign markets. Lines of trade thus established and maintained are not easily disturbed.

"But the fault of British Columbia lumbermen, or what to us seems to be their fault, or at least their responsibility for their own present situation, arose from the tremendous development of the prairie provinces. During the last two decades settlement of the prairies of Manitoba, Saskatchewan and Alberta demanded such tremendous amounts of lumber that not only the mountain mills were kept busy, but those men on the coast proper were tempted to neglect their water-borne trade for the more insistent and temporarily higher priced trade coming from the other provinces of the east. During the same period there was no such extraordinary demand from the United States, so the lumbermen of Washington and Oregon in a condition to export were able to step in and take much of the trade which British Columbia mills were neglecting in favor of the home market. But in the last few years, as was earlier the history of the western states of the Union, the special boom in the prairie provinces came to an end, and the British Columbia mills found a tremendous loss of current business with the agricultural districts, and that in the meantime they had to a considerable extent lost their foreign trade.

"There is nothing in the quality of their timber nor in its manufacture that handicaps the British Columbia mills, nor ordinarily is there a lack of shipping for them, except that the big markets draw the big supplies of carriers, and in its export trade the United States, so far as the shipping law is concerned, is on a parity with Canada. American mills, however, must be watchful lest they lose their advantage of long establishment in the foreign trade and of their present superior position."

This quotation from our contemporary, bearing out much that we have already published in these columns, comes as a lesson and as a timely warning, showing us that eternal vigilance will be the price of our export trade, and that, however keen our efforts may be to get into the export markets, we will find equally determined efforts being made by our competitors in the United States.

## New Brunswick's Pulpwood Policy

The New York Paper Trade Journal, referring to recent New Brunswick legislation, says: "We will not say that the regulation providing that no timber be cut below a certain size is not a wise and necessary measure. There has been altogether too much prodigality in the cutting of the forests as Americans have found to their cost, and conservation has become a watchword on both sides of the line. But a country can suffer just as readily from a hoarding of its resources as it can by a wasteful policy. If this was a time when capitalists were seeking investments in Canadian properties for the purpose of paper manufacture, as they were doing when Ontario and Quebec first began to impose export restrictions on wood, it would be possible to understand the present attitude of the New Brunswick Government. But when there is no prospect for additional mill construction in the Dominion except at some remote and indefinite period, and when it has been found that the prohibition of pulpwood shipments to this side has not been productive of a single paper mill within the province, is it not poor business policy to withhold the raw material when it might be sold to advantage and profit? Ontario has the right idea. Her restrictions have been elastic. She raises and lowers the bars as circumstances dictate, with the consequence that she has at all times a revenue from her resources."

# The Reader's Viewpoint on Trade Topics

## Retailers Complain of Wholesalers Who Sell to Consumers—Local Associations for Protection Being Considered

**Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—**

The following letters have been received in response to a circular sent out by the Canada Lumberman recently, asking the retailers for their views in connection with a proposal made by the Ross-Taylor Company, Limited, Exeter, Ont., that the retailers should organize local associations for the purpose of regulating many of their trade affairs; in particular for the purpose of meeting the situation resulting from some of the wholesale trade selling to contractors, farmers, carpenters, etc., who are legitimate customers of the retailers only. The Ross-Taylor Company, Limited, suggested local organizations for this purpose and asked us to secure the views of others in the trade. The letters which follow show a distinct desire on the part of retailers in Ontario to follow up such a plan. Opinions are varied as to the methods to be adopted, but evidently something can be done if the matter is taken up vigorously.

We do not wish any of our friends in the wholesale trade to consider this matter as reflecting upon wholesalers in general. The point brought out very clearly in all these letters is that there are some wholesalers, a small proportion of them fortunately, but sufficiently numerous to cause much trouble, who do not give the retailer fair treatment. So far as it lies in our power we will be glad to do our share in putting an end to this unsatisfactory state of affairs. The letters follow:—

### Retailers Have Many Troubles

Editor Canada Lumberman: Dresden, Ont.

We take it that you have sent a copy of your request to all the retailers in this western district, if not, we wish you would, so as to get a full expression. We do not feel capable of writing up so important and large a question. We concur in what Ross-Taylor Company have written and we are satisfied that nearly all the retailers are of the same opinion, and many have similar grievances.

We have experienced the same trouble here, and think it is the same wholesalers in their case as in ours.

In our case we can put it considerably stronger for this wholesaler we have reference to has shipped several cars of lumber and posts direct to our customers. These customers, in times past, when they were unable to pay for their lumber and other building materials would ask for credit, which was granted, and we carried them for months, in some cases for years. Some of the men whom we assisted to make good send their cash now to the wholesaler, being encouraged by this wholesaler to come to him, as he will sell cheaper than the retailer.

This wholesaler endeavors to make the retailer believe he will protect them, but that is far from the fact, and the retailers should get together and work out some scheme, under which action will be taken to combat such treatment by the wholesaler. When the retailers form some kind of organization and work in harmony to their mutual benefit against such encroachments by the wholesalers, then, and only then, can they protect their trade.

There are some wholesalers who care not who they sell to, whether to a retailer's customer or any one else.

We are of the opinion that the retail lumber dealers do not exchange trade views. They should meet and discuss the trade situation in all its details and, if the retailers in each district would meet, say once a month and exchange ideas and tell their individual grievances to the others, and then draft out a line of action to pursue which would be beneficial to the trade, their position would be greatly improved. This has not been done. In fact we think the retailers are not free enough to express themselves for fear that the other fellow may make a handle of it to his detriment. There should be more confidence placed in each other. If this were done, a great good could be accomplished.

We do not think any organization should be formed with a view to making prices more than a legitimate profit, but, we do think the retailers should try to protect their own interests from the encroachments of wholesalers selling direct to the consumers.

We could go on writing giving instances of how we have been treated, but, this would not help the situation.

It is our intention to write Messrs. Ross-Taylor Company asking their co-operation, and if they will meet the retailers at some appointed time and place when some definite understanding might be decided upon, something may result.

Then, again we might refer to the Farmers' Clubs which have been pretty thoroughly organized in this section. When they can organize, why not the retailer? This organization has for its object the buying of all kinds of goods, groceries, binder twine, lumber, cedar posts, fence wire, and any or all kinds of goods they may require, to the detriment of the retailer. In buying in that way they send their cash out from the home town. This is not only a detriment to the trade, but when a town has been thus treated the values of the farms are depreciated as well as the town. When their cash has gone in this way the customer goes to the retailer and asks for credit and as the retailers cannot afford to hold their goods, neither can they afford to sell on credit, yet they naturally extend the credit to their own downfall, for we think a great many failures in the retail trade have been occasioned by the credit system, where naturally some unworthy one has had credit, and some of the kind above named, as well as the man who does not think of the time when he was given the credit asked for when he had no cash, and who waits his own convenience or pleasure to pay up. Some would not pay till sued.

Another matter we think should not be encouraged, the mail order business which some concerns persist on doing. Of course the mail order houses have goods made purposely to carry this on, not that the customer gets value, but, he thinks he is buying cheaper. So he may be, but not getting value.

It would be well to have the opinion of others in the same line of business, especially west of London to Windsor and Sarnia. This no doubt would make each one think more favorably of some kind of action being taken.—Laird Brothers.

* * *

### Trouble on All Sides

Editor Canada Lumberman:

We are no exception to the rule, as we frequently run up against the wholesaler who sells to the consumer, and the worst of it is that the same wholesalers who sell direct to the consumer at wholesale prices, have the NERVE to send their wholesale list to us, and offer their goods. Not only that, but the list price on one occasion was for No. 1 Hemlock $19 per 1,000 at mill in rough, on a 9 cent rate, and they immediately quoted a customer of mine $20 sized, for the same kind of material, freight paid. Figuring their price as $18.00 at the mill, with $1.00 added for sizing, and $2.75 for freight, it seems that they would rather peddle their goods around the country, than sell to legitimate retailers. I might add that this same firm quoted us a price on a certain bill of material, supposedly to be wholesale price, and then filled the bill for a carpenter for about $25 on the whole bill less than we could do it on their quotation.

Regarding the organization of retailers, would say that, on the whole, I do not fall in with the idea of the retailers organizing in everything, but certainly agree that something must be done to protect our legitimate trade. We have our money invested in a business, and we cannot afford to stand aside and watch the farmers go by and haul their stock directly from the cars, shipped in by a wholesale dealer.

I might also say that I have a warm spot in my person for the wholesaler who will treat a retailer as he should be treated, and I also have some of my closest friends in the wholesale lumber business. It is only a few fellows who cannot, or will not market their products through the wholesale who are low enough to try and cut out their FRIENDS the retailers.

I might also add that considerable of the material which the FARMER buys direct is material which when sized looks quite passable, but if sent to a retail yard in the rough, could scarcely be sold at all. This has the tendency to make the customer think that the retailer is SOAKING him, but he cannot see the difference in quality. We have customers around here, who would pick up the piling strips around the yard, and buy them if you sold them cheap. They will take a board off the fence to patch up with, so you cannot wonder at them biting at a low-priced article regardless of quality.

I trust that I have not said anything out of the way, but I do not feel any pleasanter about this question than our friends of Exeter. I suppose every dealer runs up against the same thing sometimes.—Fair Trade.

### Many Questions for an Association

Editor Canada Lumberman: Dunnville, Ont.

We have read your letter from a retail lumberman with much interest. The proposition made by the writer of the letter that the retailers should organize themselves for the purpose of bringing the wholesalers to time in regard to selling direct to consumers, is a good one and meets with our sincere approval. We have had some trouble in our district with wholesalers selling direct to consumers, particularly in the door and interior trim departments.

Our idea is that if the retailers had some way of listing all firms who

conduct themselves thus and could submit their names to the organization for a full investigation of each particular case, it would strengthen the hands of each retailer to obtain justice. At the same time there is always danger of some retailers (very few we believe) making exorbitant charges and virtually driving the consumer to deal direct. This aspect of the case would have to be taken into consideration also.

By all means let us have an organization formed as there are many other questions arising constantly which could be better handled collectively than individually.

And further, our idea is that if such an organization is formed, it should have no connection with any association now in existence, but should be composed solely of bona-fide retail lumberman.

We hope that enough of the retailers will see the importance of such an organization to bring about the speedy formation of the same.—The Wm. Shirton Company, Limited.

* * *

## Regret Not Having Organized Long Ago

Editor Canada Lumberman: Niagara Falls, Ont.

Several years ago I tried to form such an association as your retail correspondent suggests. I made a personal canvass of the district, but met with such poor success that I finally abandoned it. Nevertheless, those who refused me then have regretted it more than I. We need it by all means, and I for one approve of it. At that time we had three retail yards and mills in town, now we have six with less business than we had before.

Wholesale men now sell to any carpenter or contractor they may pick up. I could tell you of one traveller who sold to a carpenter who was building a house, then to another repairing a barn, finally to another carpenter enough oak flooring to cover a room. Jobbers are now placing stocks of lumber in carpenter-contractors yards. These are selling stock at a price a retailer cannot touch and pay his 100 cents on the dollar.

We have no power to protect ourselves against the present class of traveller on the road. With the past seven years' prosperity of the country, any man who could hustle and learn his lesson by rote, was put on the road given a good salary, and he found business his own way.—James Harriman.

* * *

## Selling to the House Owner

Editor Canada Lumberman: Guelph, Ont.

We are perfectly in accordance with what you say in your letter. We have had two or three glaring instances of wholesalers selling to consumers occur under our own vision. One of them was with a wholesale lumber firm, who, when we asked them to get a carload of 12-foot long white pine, frowned on us, but when a local foundry whom we have been supplying for years and saving all the 12-foot stock for them, wanted some lumber; this wholesale firm deliberately picked out a whole carload of 12-foot, and sold it to them.

Another instance is in regard to maple flooring. As you are aware there are several good firms making this. Now, we cannot buy from them all, and one, the best of them, has resorted to canvassing citizens in Guelph to sell them enough flooring to cover their kitchens.

We could give you other instances but are just mentioning these to give you an idea of what some wholesalers are doing.—Robert Stewart, Limited.

* * *

## Thought they Were the Only Ones

Editor Canada Lumberman: Brampton, Ont.

We thought we were the only persons or firms whom the wholesalers were using unfairly.

We, for instance, were supplying a contractor with material, and upon running short of some stock we gave him reference to a firm to supply the material wanted to complete the work. but to send to our address. But to our surprise the firm to whom we sent the man is supplying the contractor direct now and never even thanks us for getting some business for them.

The way we have of doing things with this firm is to not buy a board from them and show then that other firms have the same stock for sale and conduct their business honestly.

In our town we have two yards; one a contractor and retail dealer; our own simply a retail yard. We simply buy from the firms who do not sell contractors and we find we have better satisfaction all around.—J. York & Sons.

* * *

## Only a Few Unfair Wholesalers

Editor Canada Lumberman:

We have not found a great deal of difficulty arising from wholesalers selling to consumers in our territory. There are a few who make themselves objectionable in this respect. Two of them are milling concerns, and there are one or two wholesale lumber firms who do business in a small way, and whose connection is not very large, and they feel obliged to dump their goods in this city when they cannot make sales elsewhere.

We find that the reputable and reliable wholesale lumbermen never infringe on this business.

We cannot say that we are favorable to the formation of another retail association, as we feel that we are already called upon to subscribe to too many associations, and know that some of those which exist now, seldom have any meetings.—Retailer.

## Organization Or Trouble

Editor Canada Lumberman: Hagersville, Ont.

We thoroughly agree with you in regard to the retail business. We think that the retailers of to-day will have to get busy and organize, or their business will suffer, more so as the days go by. We are up against the wholesaler to-day selling to farmers.—A. & W. J. Bailey.

* * *

## Co-operation Among Retailers Required

Editor Canada Lumberman:

One way to remedy this is for all lumber dealers to combine and not buy any supplies from any firm who sells the company referred to, so long as they have agents soliciting the contractors. This would inconvenience them in buying southern and western lumber, flooring, doors, columns, shingles, lath, etc.—Lumberman.

* * *

Editor Canada Lumberman: Acton, Ont.

We think the idea of forming a retailers' association a good one as it would be to our mutual advantage to talk over the several problems which come before the retail lumberman. We do not see how you can control the wholesale difficulty as the supplies of lumber are in so many different hands, and while most of the wholesalers are loyal to the retail dealers, there are also a number of outside men who will sell to any person. The only way to meet that class of competitor is to sell at a close margin in car lots and for cash.—J. B. Mackenzie.

* * *

Editor Canada Lumberman: Welland, Ont.

I would consider it very wise for the retailers to organize themselves and talk this important fact over. It hardly seems the right thing for us to be treated as we sometimes are by wholesalers. If the wholesalers do not appreciate our business enough to protect us better I centainly would be very much in favor of handing my part of the business to people who are capable of looking after it honestly.—F. Rounds.

---

## A Problem for Millwrights?

Editor Canada Lumberman:

Would some of your readers explain how the bore in a flywheel, which was found to be too small to go on the shaft could be made large enough? This had to be done some years ago in an out of the way place, hundreds of miles from a shop; no railroad, and no appliances at hand for such work.

The fly wheel was a large one, 12 ft. in diameter, the shaft 9 ins. diameter, the bore in the wheel was 1-128 part of an inch too small.

The wheel came to the mill in two halves, there were two iron rings shrunk on the hub and fastening bolts at the rim to hold it when put together.

The man in charge did the work at the mill in a very short time; the men who were working with him told the writer about this, but could not give a very clear explanation of how the work was done.—W. Marsh.

---

## Lumber and Furniture for South Africa

Attention is called by the Department of Trade and Commerce to Trade Inquiries Nos. 688 and 689, appearing in the Weekly Bulletin, forwarded by Mr. W. J. Egan, Trade Commissioner at Cape Town, South Africa.

The first refers to a South African commission house desirous of obtaining samples and quotations of British Columbia lumber. They state that there is a demand in South Africa for a hardwood which is called "Canadian Pacific wood." It is described as a brownish wood and is used for piles, girders and shaftings. Quotations c.i.f. South African ports, together with full particulars of sizes, quantities and delievries are requested. They have at present a special inquiry for the following sizes:—

Length, 5 feet x 16 x 4½ inches.
Length, 5 feet x 18 x 4½ inches.
Length, 10 feet x 16 x 4½ inches.
Length, 10 feet x 18 x 4½ inches.

or in logs 22 inches diameter, length 10 feet 3 inches. It is also requested that prospecitve shippers in quoting should give the weights in cube so that the South African rail charges may be estimated in making quotations for inland deliveries. Attention is also called to the demand which at present exists in South Africa for hickory.

With regard to the second Trade Inquiry, Mr. W. J. Egan, Trade Commissioner at Cape Town, states that the dealer referred to requests catalogues and price lists on furniture ready for upholstering, packed for export in the knock-down state: The largest demand is for dining-room furniture made of birch and finished in walnut and oak. There is also a demand for frames of couches and easy chairs made from the common deal. Prices should be quoted f.o.b. Montreal or St. John, also data giving information of the number packed in each crate and the weights and measurements of each crate or case.

Birds eye view of Three Rivers, Que.

# Quebec's Great Lumber Producing Centre

## Three Rivers—A City with Exceptional Manufacturing and Shipping Advantages —Output of Over 300,000,000 Feet Annually

Quebec Province has long been noted as one of the greatest lumber producing provinces of the Dominion, and Three Rivers as one of the largest centres of the lumbering industry in that province. In fact. Three Rivers owes its existence and its growth to a city of over 15,000, directly to this important industry.

The city is ideally located on the St. Lawrence River, half way between Montreal and Quebec, and at the junction of the St. Lawrence and St. Maurice rivers, at the head of deep water navigation. The St. Maurice River itself taps the heart of one of the largest timber sections of the province. Its shipping facilities are further augmented by the C. P. R., G. T. R., I. C. R., St. M. V. R., and the D. & H. R., and present to the manufacturer, particularly of lumber and lumber products, unexcelled facilities. As a result some of the largest pulp and lumber manufacturing concerns of the province have located there, and the industrial backbone of Three Rivers and the surrounding country has for many years been the lumber industry, supplied by the forest products of a vast territory extending northward more than 300 miles and drained by the great St. Maurice River and its many tributaries.

### History of the Three Rivers Industry

Lumbering operations were first opened up on the St. Maurice River about a century ago (1816), Mr. George Baptist building the first sawmill at the little river Cache about 12 miles above Three Rivers on the St. Maurice River. A few years later he began operations at the Gres Falls, about four miles higher up the river, with the first water power plant in the district, and floated the manufactured products to Three Rivers and large timber rafts to Quebec for shipment to the Old Country. This was the opening of the lumber and pulp industry now known as that of the St. Maurice Territory.

Canadian and American capitalists became interested and gradually established themselves. Grand Piles, 31 miles above Three Rivers, soon became the headquarters of supplies for the upper regions. Grand'Mere and Shawinigan Falls afterwards became prominent as pulp and paper manufacturing centres, the Laurentide Pulp & Paper Company establishing an immense plant in the former town, whereas in the latter town the development of the famous Shawinigan Falls by the Shawinigan Water & Power Company, and the installation of the Belgo-Canadian Pulp & Paper Company, and several other large industries followed shortly afterwards. The progress of these companies is now well known to those well informed. The latest in this district is the town of La Tuque (100 miles from Three Rivers), where a splendid water power is at hand; it is owned by the Brown Corporation, manufacturers of pulp and paper. La Tuque is built on the main line of the Transcontinental, Quebec and St.

Rear of mill and sorting shed—Wayagamack Pulp and Paper Company.

Le Boulevard—Three Rivers, P.Q.

Brown Corporation plant at La Tuque, P.Q.

Conveying pulpwood from river to plant—Brown Corporation.

John Railways. It is at the head of the navigable waters of the St. Maurice and promises to be a flourishing lumber centre, being favorably located for the northern operations for the lower part of the district.

### Prominent Three Rivers Firms

At Three Rivers are located the immense pulp and saw mills of the Wayagamack Pulp and Paper Company, whose sawmills alone turn out over 30,000,000 feet annually, and whose up-to-date plant was fully described in a former issue of the Canada Lumberman.

The Gres Falls Company, operating a large mill at Three Rivers, cut over 50,000,000 feet, which is converted into pulpwood and lumber. Unfortunately, the sawmill of this concern was burnt to the ground several weeks ago, but plans are already under way for the reconstruction on a larger scale than before. The concern is a subsidiary company of the Union Bag & Paper Company, who also operate mills in the district.

Another large industry at Three Rivers is the St. Maurice Lumber Company, which manufactures about 50,000,000 feet into lumber and pulpwood.

J. H. Dansereau operates a modern mill at this point and this year will cut 10,000,000 feet of lumber.

The Burrill Lumber Company also operate a mill at Three Rivers, with a capacity of 2,000,000 feet annually.

At the present time this territory furnishes a cut of lumber and pulpwood floated and driven on the St. Maurice River and tributaries equal to about 330 to 350 million feet board measure, of which no less than 175 million feet is manufactured in Three Rivers. Of this large cut about 100 million feet is being cut for the export trade in the European market this season.

Mill of The Gres Falls Company. Destroyed by fire recently but being rebuilt.

## The Late J. D. Shier

Readers of the Canada Lumberman learned recently with much regret of the death of Mr. J. D. Shier, president of the J. D. Shier Lumber Company, Bracebridge, Ont. In our issue of June 1st we were able to include only a brief reference to the loss which the lumber industry of Ontario has sustained through Mr. Shier's death.

The late Mr. J. D. Shier had been in poor health for nearly a year and had been confined to his home almost continually since February. Mr. Shier was born on July 10th, 1845, in Brock Township, Ontario County. He received an elementary education in the public schools and remained on the home farm until he was 25 years of age. He was the fourth son of Mr. Philip Shier whose parents came from Ireland in the early thirties and settled in Brock Township when that section was a dense forest. In 1837 the late Philip Shier raised a company of 100 men during the rebellion.

When Mr. J. D. Shier reached 25 years of age he looked for a wider field of work than that which he could obtain upon the farm. His start in the lumber business was made at the bottom of the ladder. He went into the camps in winter and worked on the drives in the spring and summer, for four years, after which he was in a position to start a small shingle industry at Washago. Later he moved to Severn Bridge where he remained for four years and built up a good business in the manufacture of shingles. Soon he had increased his capital sufficiently to enable him to buy out the old saw mills at Bracebridge. This was the foundation of the large business which he built up. The J. D. Shier Lumber Company has the distinction, it is said, of being the first mill in Canada to install a double cutting band saw. This indicates the progressive nature of the management which the late Mr. Shier gave to his business. In less than 30 years the young man who went into the camps as a lumberjack had become an extensive exporter, the annual output of the plant being between 15,000,000 and 20,000,000 feet.

Mr. Shier's energies were not confined to the building up of his own business success. He gave his services freely to the town of Bracebridge and was a member of the Council from 1892 to 1900 and again in 1904. In 1903 he was elected mayor. Mr. Shier was a fluent speaker, shrewd business man, and of a kindly disposition which brought him the respect and admiration of everybody with whom he came into business or social contact. Much of the progress of the town of Bracebridge in recent years has been due to his energy and foresight.

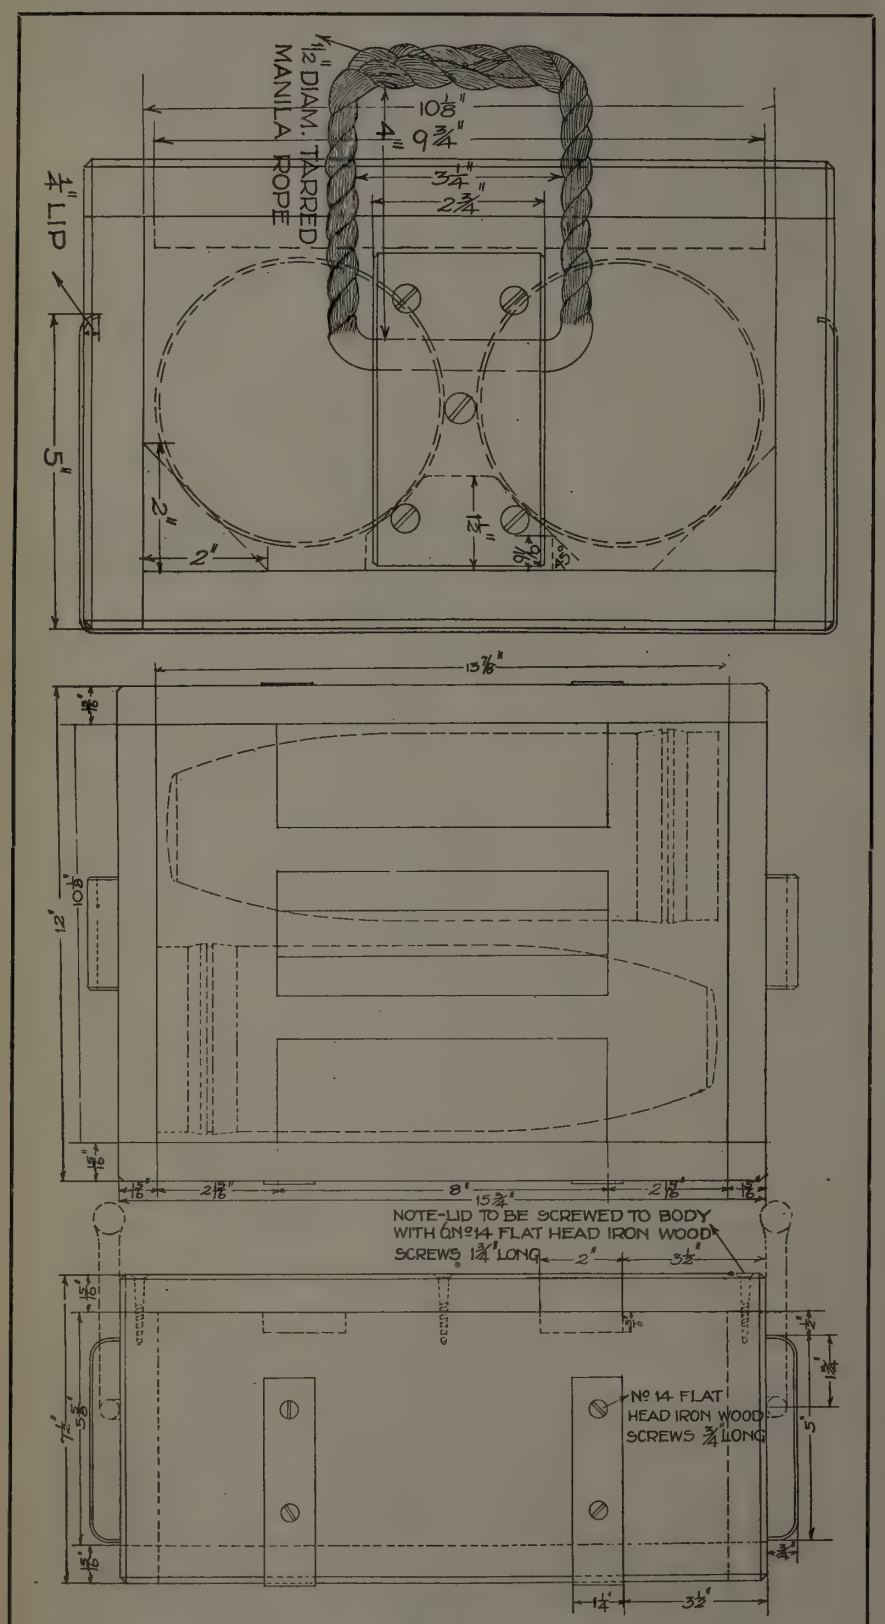
Burrill Lumber Company's office.

# Shell Committee Wants Many Boxes

## Specifications and Drawings Showing Details of Box Required for Shipment of Howitzer Shells

Ottawa, June 8th (Special to the Canada Lumberman-:—The Shell Committee of the Dominion Government will require thousands of boxes in which to ship to England the great quantity of shells that are being made in over 300 factories throughout Canada. The Committee is open to receive tenders on boxes in lots of 25,000 or more. These boxes are each to hold two 4.5 inch Howitzer shells. The boxes are to be well made, according to the following specifications. Tenders should be addressed to the Shell Committee, Stephen Building, Queen Street, Ottawa, Canada.

The specification reads as follows:—



**Sketch plan of box required by Shell Committee, Ottawa.**

Box Projectile.—Wood without tin lining, to hold two plugged shells.

Shell Q. F. high explosive 4.5 inch Howitzer Mark V/L/.

Specification to govern manufacture and inspection.

**General.**—The box must conform in all particulars with drawing S.C.-C38, the sealed pattern and this specification. Should any discrepancy be found to exist between the drawing, pattern and this specification, reference is to be made to the Chief Inspector.

1. **Lumber.**—All lumber to be manufactured from sound stock and to be of even thickness the entire length. To be thoroughly seasoned or dried, free from sap, black or unsound material and loose knots. One end only may be allowed to be split, this split not exceeding 6 inches. No knot is to exceed 2 inches in diameter.

These boards should be firm, strong, serviceable, without waste, and dressed. Thoroughly seasoned as here used is meant a seasoning or drying, either in the open air, or in a kiln or in both, uniformly throughout the entire sections of size delivered, the average percentage of moisture contained in the lumber when delivered not exceeding more than 10 per cent. of its weight, as determined by the actual experiment.

2. (a) **Body.**—The body to be made of spruce except the ends and handle cleats, which are to be made of hardwood, birch or maple. The lid and bottom may have one joint in each, which must be grooved, cross-tongued and glued. The sides, ends and bottom, to be well nailed together with 2½ in. wire nails, the boards may be dressed to an even thickness of 15/16 in., the sides are to be further secured to the bottom by sheet iron bands held by iron screws.

(b) **Lid.**—The lid is to be provided on the inside with battens of spruce, to be secured with 1¼ in. wire nails, also drilled with six countersunk holes for screws 1½ in. No. 12.

(c) **Internal Fittings.**—The box is to be provided on the bottom with V supports of spruce accurately made to the requisite form, shown in the drawing.

(d) A handle is to be attached to each end of the box by a cleat secured by iron screws. The handles are to be made in the form of a spliced gummet of ½-in. diameter tarred manilla rope of the best quality obtainable.

3. **Material and Workmanship.**—The materials are to be of the best quality, thoroughly sound and free from defects. The wood is to be well seasoned. Where boards are made in more than one piece, the joints are to be made to clear the screw, and no piece is to be less than 3 inches in width; the flue to be of the best.

The external edges are to be chamfered off as per drawing, and the boxes to be delivered unpainted.

4. **Tests.**—The contractor is to intimate to the Inspector when the material is ready for inspection. All parts damaged by or during testing must be repaired or replaced free of cost, by the contractor, to the satisfaction of the Inspector.

The boxes will be tested by a strain applied to the handles equal to a dead weight of 350 lbs., and must be capable of standing this test without showing any defect.

5. **Marking.**—Each box is to have the following stamped on it in legible type, and all on the same end of the box.

Contractor's initials or recognized trade mark.

Year of Supply

Numeral

6. **Inspection.**—If on examination of 20 per cent. of any delivery, .20 per cent. of these examined be found defective or incorrect, the whole delivery will be rejected without further examination. Any departure from the terms of this specification may involve the rejection of the boxes affected.

The boxes may be inspected during manufacture by, and after delivery will be subject to testing by and final approval of the Chief Inspector or an officer deputed by him.

Further, the inspector is to have the privilege of examining the lumber at any stage of manufacture, from the kiln to the finished box.

## Australia Timber Requirements Increasing

The importations of timber from the Pacific Coast have, during the last few months, been particularly heavy and, from forward contracts made, there is every indication that large quantities of Douglas fir will be delivered at the principal Australian ports during the balance of the year, says Mr. D. H. Ross, Canadian Trade Commissioner at Melbourne, in a recent report. The demand has been to some extent accelerated by the shortage in supplies of Baltic timber. At a recent date the shipments arranged from the Pacific Coast aggregated over 20,000,000 feet, comprising twelve cargoes for Sydney, six cargoes for Melbourne and two cargoes for Adelaide. Of the twenty ships chartered, nineteen loaded in United States ports and one loaded in British Columbia. This fleet of timber carriers is chiefly composed of sailing vessels, a number of which sail under the United States flag. At latest advices there was practically no disengaged tonnage capable of carrying timber on the Pacific Coast. The demand for tonnage, despite the heavy advance in freights for timber shipments, has caused an addition to the regular steamers and sailers engaged in the trade across the Pacific by the advent of a number of smaller vessels that seldom go into the over-sea trade.

# Credit Troubles Need Co-Operation

## J. B. Reid Tells Toronto Trade That They Should Agree to Cut Out Chronic Note Renewers

At the meeting of the Lumbermen's Section of the Toronto Board of Trade, which was held on June 4th, an important discussion was commenced in connection with the renewal of notes by customers. The matter was brought up by Mr. J. B. Reid, who presented the following motion:—"We, the members of the Lumbermen's Section of the Toronto Board of Trade, agree that we will not sell to customers who do not pay fifty per cent. of their notes at maturity; this resolution to apply on all new business from the date when it is carried."

Mr. Reid, in speaking to his motion, said that it was intended to give the wholesaler the same standing as a bank manager. He would be able to say to his customers when they came to renew their notes, that the best he could do would be to take a payment of fifty per cent. in cash and the balance in a renewal note. The motion was meant to impress the retailer as well as the wholesaler. As a general proposition this would be a good step for everybody.

Mr. W. J. Lovering expressed his approval of the plan if it could be effectively carried out. He had always endeavored to conduct his own business on similar lines, but in the last eight or ten months he had found it very hard to get a payment of 25 per cent., some times even 10 per cent., when a note was being renewed. It often happened that he was very glad to get even 10 per cent., and that, knowing his customer's position, he was satisfied that he would get his money finally, and so he was willing to continue selling to him. If the motion were carried and put into effect they would be obliged not to sell to this kind of man, until he had redeemed his paper. He did not think they could make a hard and fast rule along these lines. It was a good rule to have as a basis of business management that notes should not be renewed for more than fifty per cent., but there were circumstances under which they would not be able to follow it.

### Should Cut Out Frequent Renewals

Mr. Reid explained that the object of the motion was to have the new rule apply only upon business transacted after the motion should be carried. He wanted to have it agreed that in future customers would be told that they must pay fifty per cent. when their notes fall due. The retailers, he said, wanted to force the hands of the wholesalers a little, to make them help themselves and so help the retailers. If the wholesalers continued furnishing lumber for retailers and taking ten per cent. payments when the notes fell due, they would kill every retailer who paid 100 per cent. As a retailer he wanted to see the wholesalers meet the retailers half way by agreeing to insist upon a payment of 50 per cent. If the wholesalers would not do this all the retailers would soon be in the same boat as the 10 or 25 per cent. man. The wholesaler who accepted 10 or 25 per cent. on mature notes was putting a weapon into the hands of his customers with which to strike a blow at the man who could pay and wanted to pay his notes in full. They were helping men to continue in business who never should be in it. A large amount of the trouble in connection with the lumber trade today was the result of the wholesaler giving indiscriminate credit to the retailer. He thought that it was really time for the wholesale men in Toronto to realize that it was their duty to protect the retail men who were doing a respectible business.

The renewal business was the biggest curse in the whole lumber trade. It could be all worked out and put upon a satisfactory basis. It was only a matter of not trying to do all the business. It would not take twelve months to educate all their customers and to convince them that they must pay at least one half upon their notes at maturity. If they could not or would not pay one-half then, the trade should stop selling to them until they could. The honor, the respectability, and the future good of the lumbermen of Toronto depended greatly upon this one matter.

### A Suggested Amendment to Include Terms of Trade

Mr. Eckardt expressed the opinion that he would not like to see the motion carried in the form in which it had been presented. It would be unwise to pass a resolution when they knew beforehand that they could not carry it out. The motion might be an advantage if it carried with it the general terms of the trade. He would move as an ammendment that it should be recommended to the members of the Lumbermen's Section of the Board of Trade that the terms of the trade should be 2 per cent., 15 days, or 90 days net, and that renewal notes should not be given for more than 50 per cent. of the original amount, and that when the renewal note matured payment in full should be required. He would prefer to put the matter thus, in the form of a recommendation, so that when carried it would be as an understanding arrived at in regard to the terms of the trade in general. While his own firm had made it a general rule that 50 per cent. should be paid when a note fell due, they had been at times in the same position as Mr. Lovering, having to take even less than 10 per cent. from men whom they knew to be alright.

Mr. Reid said that he did not think it would be any hardship to make a rule of telling customers that they must pay at least 50 per cent. at maturity. The resolution simply called for an understanding that, in connection with new business, men who would not pay 50 per cent. at maturity should no longer be granted credit.

On motion of Mr. Lovering the discussion on the subject was adjourned until the next meeting.

At the meeting held on June 11th, the discussion was continued and Mr. Reid's motion was finally carried unanimously, in a slightly altered form, as follows:—"We the members of the Lumbermen's Section of the Toronto Board of Trade agree that, to the best of our ability, we will not sell to customers who do not pay at least 50 per cent. of their notes at maturity; this resolution to apply on all new business from this date."

---

## Ontario Exports to United States

The United States Consul at Toronto in his annual report to the Bureau of Foreign and Domestic Commerce, includes the following statistics of exports from all Ontario Consulates and Agencies to the United States during 1913 and during 1914.

| Articles | 1913 | 1914 |
|---|---|---|
| Wood, and manufactures of: | | |
| Logs | ..... | 44,927 |
| Pulp wood, peeled | 805,235 | 317,606 |
| Timber, ship | 1,201 | 1,748 |
| Lumber— | | |
| Dressed | ..... | 190,465 |
| Rough | 8,231,478 | 7,404,086 |
| Hubs of wheels | ..... | 701 |
| Laths | 474,876 | 434,773 |
| Pickets | 184,066 | 87,249 |
| Shingles | 56,994 | 45,538 |
| Staves | ..... | 2,604 |
| Wood pulp | 320,061 | 1,045,215 |
| Furniture— | | |
| Cabinet | ..... | 37,781 |
| Willow | ..... | 2,195 |
| Barrels | ..... | 6,194 |
| Boats | 4,880 | 2,371 |
| Hockey sticks | 4,104 | 1,564 |
| Poles | 4,454 | 20,416 |
| Posts | ..... | 12,495 |
| Railway ties | 30,134 | 5,183 |
| All other | 1,102 | 361 |

From the Toronto Consular District the declared exports included the following:—

| Article | 1913 | 1914 |
|---|---|---|
| Wood, and manufactures of: | | |
| Boat hulls | ..... | 500 |
| House furniture | ..... | 36,981 |
| Laths | ..... | 14,625 |
| Lumber— | | |
| Rough sawn | 68,360 | 101,179 |
| Dressed, two sides | ..... | 2,922 |
| Telephone poles | ..... | 263 |

---

## Wood By-Products Required in England

The Canadian Trade Commissioner at Leeds, Eng., in a recent report says:—A market exists in this part of England for certain wood by-products, and some particulars in regard to this trade should be of interest to Canadian firms.

Wood fibre (or wool), which should be thoroughly dried before shipment, is imported in press-packed bales. The chief use which is found for this fibre is for the packing of all kinds of merchandise. It is also used in the upholstery trade, and in this connection one local firm supply the fibre for such purposes as the upholstering of railroad and other carriages, street cars, automobiles, omnibuses and steamships. In some cases, wood wool is also used for water filtration.

Another by-product is wood meal or flour. This meal is sold in different grades of fineness and is used in the linoleum trade as well as in the manufacture of explosives.

Wood rope, which is spun from wood fibre, is another commodity dealt in, and finds a market among furniture packers, ironfounders, and engineers.

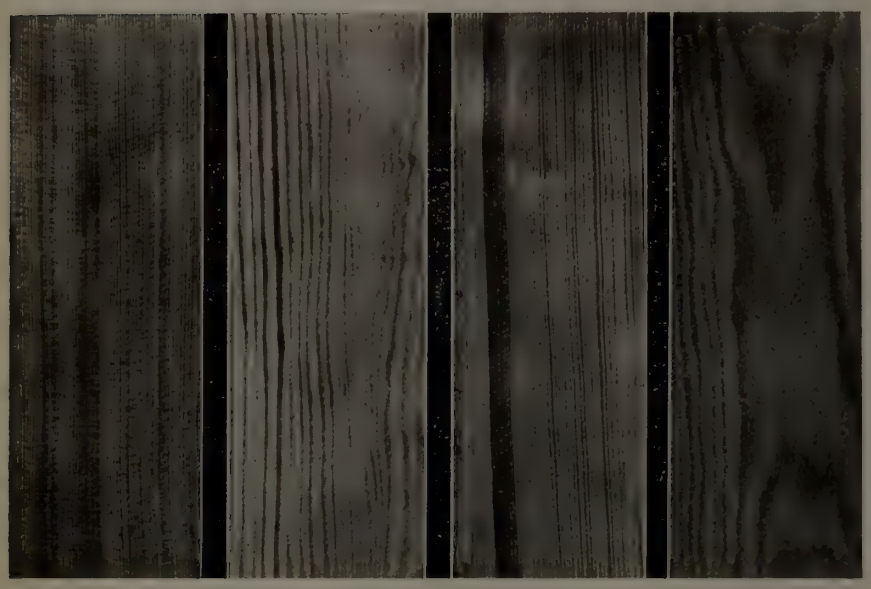
Another article of commerce manufactured from wood waste is miscible naphtha, which is used as a constituent in the making of methylated spirits. One Canadian firm, it is pleasing to state, already send wood naphtha to this market.

All of the above products are manufactured in England, but, in addition, supplies are imported from Norway, Sweden, and also from Belgium and Germany (in normal times). At present, the import trade is considerably handicapped by the high shipping freights now ruling.

# The Commercial Importance of Hemlock

## Technical Properties and Practical Uses of the Different Varieties of an Important Canadian Wood

By A. H. D. Ross



1. 2. 3. 4.

1. Eastern Hemlock, Edge Grain
2. Eastern Hemlock, Slash Grain.
3. Western Hemlock, Edge Grain.
4. Western Hemlock, Slash Grain.

Of the 27 kinds of lumber manufactured in Canada during the year 1913 hemlock ranks fourth in the amount produced. For this year 1,198 mills reported a cut of 306,342,000 board feet of hemlock, which is 8.6 per cent. of the total cut of 3,553,029,000 feet of soft-wood lumber, or 8 per cent. of the total production of 3,816,642,000 board feet.

During 1912 the total cut of hemlock was 333,238,000 board feet, or 7.6 per cent. of the total cut of 4,389,723,000 board feet, and the average price obtained was $13.45 per M.; whereas in 1913 the average price was $14.71 per M.

A comparison of the figures for 1912 and 1913 shows that in 1913 the amount of hemlock manufactured into lumber diminished 8.1 per cent., whilst the cut of spruce fell off 9.6 per cent., Douglas fir 10.9 per cent., white pine 25.6 per cent., and cedar 35.2 per cent. This shows that the falling off in the production of hemlock was less than for the rest of the woods used for construction purposes. One reason for this is the growing scarcity of the good old white pine, another the use of spruce in increasing quantities for the manufacture of pulp and paper, and a third the care taken by manufacturers of hemlock lumber to produce it in uniform widths; particularly in 2 x 4, which is especially suitable for studding. Most mills also sort out the different widths and lengths and are therefore in a position to supply any number of pieces in the sizes called for—thus making it popular with the retail dealers and the builders.

The following table shows the number of mills manufacturing hemlock lumber in each of the provinces during the year 1913, the amount of lumber sawn in each, its percentage of the total production of 306,342,000 board feet and the average price per M.

| Province | Number of Mills | Board Feet | Percentage of Total Cut of Hemlock | Average Price per M |
|---|---|---|---|---|
| Ontario ... ... ... ... | 467 | 142,731,000 | 46.6 | $16.78 |
| Nova Scotia ... ... .. | 204 | 63,851,000 | 20.8 | 11.63 |
| Quebec ... ... ... ... | 378 | 38,491,000 | 12.6 | 14.12 |
| New Brunswick ... ... | 80 | 21,952,000 | 7.2 | 12.38 |
| Prince Edward Island.. | 16 | 265,000 | 0.1 | 14.59 |
| British Columbia ... ... | 53 | 39,052,000 | 12.7 | 14.06 |

### Three Distinct Species of Hemlock

From the above table it will be seen that seven-eighths of the hemlock lumber produced is cut in 1,145 mills in eastern Canada, whilst the remaining eighth is cut in 53 mills in British Columbia. In eastern Canada it is all obtained from Eastern Hemlock (Tsuga canadensis), which is also known by the names Canadian Hemlock, Hemlock Spruce, and Spruce Pine. In British Columbia practically all of the lumber is manufactured from Western Hemlock (Tsuga heterophylla), which is also known as Black Hemlock, Western Hemlock Spruce, Prince Albert's Fir and Alaska Pine. Occasionally a log or two of Mountain Hemlock (Tsuga Mertensiana), which is also known as Patton's Hemlock, Black Hemlock, Hemlock Spruce, Alpine Spruce and Weeping Spruce, comes up the jack ladder with western hemlock.

The range of eastern hemlock extends from Nova Scotia westward through New Brunswick, the Valley of the St. Lawrence, and Lake Temiskaming to Lake Superior and eastern Minnesota; southward to Delaware and along the Appalachian Mountains to Georgia. It is seldom found in pure stands, but is nearly always mixed with other species in upland forests; often covering the northern slopes of rock ridges and the steep rocky banks of narrow gorges. It is a moisture-loving tree, and does best in cool, deep, moist soils, but will also adapt itself to dry and shallow soils; although, in the latter case the growth is much slower than in better situations. A study of 186 trees in Michigan and 124 trees in North Carolina showed that the average age of trees measuring ten inches in diameter (outside the bark and 4½ feet from the ground) was 120 years in Michigan and 96 years in North Carolina; whilst twenty-inch trees were produced in 220 and 218 years respectively. These figures give some idea of the long time required to grow hemlock logs. If a cross-section of hemlock is examined it will generally be found that the annual rings of growth are much narrower in the centre than some distance from it, and that narrow rings are found again near the bark. The reason for this is that hemlock usually begins its growth in the shade of other trees and grows slowly because it is deprived of much light. Being a shade-enduring species it is able to hold until the crown-cover of its competitors becomes thinner, when the extra light admitted causes a more rapid growth. Finally, the crowding together of the crowns and the competition of root space in the soil causes a diminution in diameter growth and a consequent narrowing of the rings. Thus it appears that the life history of the tree may be read from a cross-section of its stem.

The stem, trunk or bole of the eastern hemlock tapers considerably and is often irregular in outline. When full grown the trees attain a height of 60 or 80 feet and a diameter of 2 or 3 feet; occasionally reaching 100 feet and 4 feet.

The western hemlock is found from Alaska southward to northern California and eastward over the mountains of south-eastern British Columbia to Montana and Idaho. A heavy precipitation and high humidity favor its growth and the trees range in height from 120 feet to 250 feet, and in diameter from 2 feet to 7 feet; the largest size being found in Washington and Oregon. In British Columbia a study of 30 trees near Yale, 39 trees near Lake Slocan and 72 trees near Ladysmith showed that ten-inch trees were grown in 86, 99 and 60 years, respectively; and twenty-inch trees in 140, 162 and 108 years. The stems taper less and are more cylindrical than those of its eastern relative, but are often much buttressed at the base. The trees thrive in any soil with abundant moisture and are usually mixed with Sitka spruce (Picea sitchensis) in the north; commonly with Douglas fir (Pseudotsuga mucronata), western cedar (Thuya plicata), and low-land fir (Abies grandis)—but also occur mixed with western white pine (Pinus monticola), western larch (Larix occidentalis) and Englemann spruce (Picea engelmannii).

The mountain hemlock is an alpine tree with little general resemblance to the better known western hemlock; the upper third of the crown having very short drooping branches and exceedingly slender whip-like leaders which are gracefully pendulous. In southern British Columbia it occurs mixed with yellow cedar (Chamaecyparis nootkatensis), amabilis fir (Abies amabilis) and alpine fir (Abies lasiocarpa). At high altitudes it is mixed with western white pine, alpine fir, Englemann spruce and mountain larch (Larix Lyalli).

### Technical Properties and Uses of Eastern Hemlock

The heartwood of eastern hemlock is of a light brown color tinged with red, is rather cross-grained and coarse-textured, has an average weight of 26 pounds per cubic foot when thoroughly kiln dried, is fairly stiff, but is rather harsh and splintery. For this reason it is somewhat difficult to work, and as it also has a tendency to warp and twist it does not find much favor with woodworkers. It is, however, a stiff, non-resinous wood, holds nails well, is abundant and fairly cheap, and is suitable for many purposes where more expensive woods were formerly used. In Ontario 90 per cent. of the hemlock lumber used goes into the framework of buildings, and into rough sheeting; the other 10 per cent. being used in the construction of box cars, rough boxes, moulding flasks, well covers, curbing, cribbing, etc. The native supply is quite adequate for the demand and 97 per cent. of the hemlock used comes from Ontario mills—the remaining 3 per cent. coming from Quebec, Wisconsin and Michigan. One-inch hemlock sheeting cannot be excelled, as it holds nails much better than any other wood and is more durable than any other roof-

ing material. Hemlock is also desirable for breakwater and wharf construction and is usually the right size for producing 10-in. x 10-in. and 10-in. x 12-in. timbers, which are the two favorite sizes for this class of work. Both white pine and spruce are too expensive for this work and the latter is generally too small in size.

In the Maritime Provinces hemlock is used mainly for building construction and car building, and to a limited extent for boat frames, interior finishing, rough boxes, slack cooperage, agricultural implements, ground wood pulp and sulphite pulp.

Mechanical tests of eastern hemlock grown in Marathon County, Wisconsin, gave the following results. These tests were made in the Forest Products Laboratory at Madison, Wisconsin, which is probably the most complete testing plant in America, if not in the world, and is under the control of the United States Forest Service. Clear, straight-grained specimens measuring 2 inches square and four feet long were used for testing in various ways. The specimens showed an average of 24.4 rings per inch, 31 per cent. of summer wood, and a moisture content of 129 per cent. as they came from the logs sawn up in the mill. The shrinkage in volume from the green to the oven-dry condition was 9.2 per cent. Cross-bending tests were made in two ways. In the static method a steady pressure was applied to the centre of the specimen supported in a horizontal position and was increased until it failed. In the impact test a 50 pound hammer sliding in a frame (as in a pile driver) was allowed to drop from a gradually increased height until the specimen failed. The average of the static tests on green specimens showed that the "modulus of elasticity" was 917,000, and on specimens containing only 9.5 per cent. moisture it was raised to 1,048,000. For green and dry specimens the "modulus of rupture" was raised from 5,770 to 7,510. In the impact tests the modulus of elasticity was found to be 1,025,000 and complete failure occurred when the height of the hammer drop reached 17 inches. For green specimens the endwise crushing strength was 2,750 pounds per square inch, and for those containing 9.5 per cent. moisture, 5,740 pounds.

The hardness tests were made by finding the number of pounds pressure required to force a steel ball 0.444 inches in diameter into the wood to half its diameter. For end surfaces the average pressure was 463 pounds, for radial sections (edge grain) 354 pounds, and for tangential sections (slash grain) 334 pounds. Shearing tests were made in a direction parallel to the grain, and showed a strength of 790 pounds per square inch in a radial and 813 pounds in a tangential direction. The cleavage strength in a radial direction was 168 pounds per inch of width and 151 pounds per inch in the tangential direction. Anyone who has split hemlock will appreciate this.

### Properties and Uses of Western Hemlock

The heartwood of western hemlock is pale yellowish-brown, straight-grained, fine textured, weighs about 28 pounds per cubic foot when thoroughly dry, is rather soft, but is strong and tough, and does not splinter like eastern hemlock. Its sapwood is thin and nearly white and the lumber is much superior to that of eastern hemlock—the better grades of western hemlock being superior to the poorer grades of white pine. The larger size of the trees and their comparative freeness from wind shake and butt rot result in a much higher percentage of clears than are ever obtained from eastern hemlock. Its straighter grain and greater softness make it easier to work, whilst its lighter color makes it more suitable for interior finishing. Besides all this it is a much stronger wood and quite free from warp and shake. Test pieces containing 52 per cent. moisture showed a modulus of elasticity of 1,428,000, a modulus of rupture of 7,290 and an endwise crushing strength of 3,390 pounds per square inch, whilst a reduction of the moisture content to 12 per cent. of the kiln dry weight raised these values to 1,666,000; 10,370 and 5,400, respectively. Because of the prejudice against the name "hemlock" in any shape or form, western hemlock is often sold under the trade name of "Alaska pine" or "red fir." Greater efforts should be made to let its advantages be known to the general public.

### Hemlock Ties

In 1913 the number of eastern hemlock ties sold to the steam and electric railways of Canada totalled 1,199,699, and the average price paid for them was 38 cents. Ties made from western hemlock totalled 479,113 at a cost of 31 cents each. As the total number of ties sold was 19,881,714, it will be seen that eastern hemlock made up 6 per cent. and western hemlock 2.4 per cent. of the total.

Western hemlock is used to some extent for piling but does not drive as well as Douglas fir. In fresh water it lasts about ten years, but in salt water is soon attacked by the teredo and other boring mollusks. This wood is used to a very limited extent for telephone and telegraph poles.

### Preservative Treatment

Untreated hemlock ties last from four to six years, according to quality of timber and location in track. In considering their treatment with creosote or other preservatives it is first necessary to know something about the minute structure of the wood before deciding upon the method of treatment to be adopted. A knowledge of structure also furnishes an explanation of the behaviour of the wood under the rail. In the case of eastern hemlock, the cells formed in the first part of the growing season are much thinner walled than those formed in the outer portion of the annual ring. This outer zone of thick-walled tracheids forms from one-fifth to one-quarter the cross-section of the ring, but the line of demarkation between the two classes of cells is not so sharp as in eastern tamarack and western yellow pine. The thin-walled tracheids in cross-section are generally squarish and show a comparatively large interior space or "lumen," but their corners are not thickened as in western yellow pine, and consequently the wood crushes more easily. Besides this the hemlock tracheids are "brash" and break off quite short under the pressure of the rail. The pith rays are composed of single rows of cells arranged one above another, but as these cells are comparatively short and easily parted the rays (resembling the spokes of a wheel) do not bind the wood together as firmly as in the oaks. In western hemlock the summer-wood portion of the ring is about equal to the "springwood" portion; the structure of the latter being very open, with large thin-walled tracheids.

The structure of both eastern and western hemlock admits of treatment with antiseptics, but it must be thoroughly done if the best results are to be obtained. There is abundant proof of well-treated hemlock ties lasting 15 to 20 years, and one instance of a kyanized (mercuric chloride treatment) tie being still sound at the end of 39 years. Both mercuric chloride and zinc chloride (burnetizing process) hardens the fibres of the wood and increase its strength. Creosote preserves the timber but does not harden the fibre. When treated with creosote the fluid is absorbed rapidly by the summer wood, and then the spring wood; the heaviest absorption being along the zone of the resin cells. The absorption in the radial and tangential directions is only about one-eightieth of that in the longitudinal direction, and hemlock ties exhibit the peculiarity of exuding oil for many hours after treatment; probably because of the escape of air confined in the wood.

During 1913 the total amount of wood used for the manufacture of pulp and paper was 1,109,034 cords; 68 per cent. of this being spruce, 25.5 per cent. balsam fir, 4.3 per cent. hemlock, and 1.7 per cent. eastern jack pine. Of the 47,360 cords of hemlock used, 44,431 cords (92.3 per cent.) were used in British Columbia. Of the eastern hemlock, 1,700 cords were used in Nova Scotia, 705 in Quebec and 524 in Ontario. The finer-grained structure of western hemlock and its longer fibre should make it more suitable for pulping purposes than its eastern relative. Possibly the mountain hemlock will be used for this purpose as it is usually too small for saw timber. The principal objection to both the western and the mountain hemlocks for pulp is the reddish tint of the heartwood.

Until a few years ago practically all the tannin used was obtained from the bark of eastern hemlock and oaks, but now only small tanneries situated in hemlock districts depend altogether upon bark. In Ontario there are 36 tanneries, in Quebec 26, in New Brunswick 3 and in Nova Scotia 2. In Wisconsin the tanneries use approximately 150,000 cords of hemlock bark each year and in Michigan the consumption is 87,000 cords—the average price obtained in Wisconsin being $10.50 per cord f.o.b. cars, and in Michigan $10.00. In Canada the 67 tanneries use about approximately 77,000 cords a year; averaging $8.42 per cord.

Chemical analysis shows that the bark of the eastern hemlock contains 13.1 per cent. of tannin, and of the western hemlock 16.5 per cent. Although the western species shows the higher percentage of tannin, its bark is thinner and the cost of collecting is higher, so it has not been used to any extent for tanning. In New Brunswick considerable hemlock bark extract is manufactured and shipped to England, but there is not a heavy demand for it because of the competition of other extracts, such as quebracho, mangrove, mimosa, divi divi, chestnut, etc.

---

## Saskatchewan Report Upon Planing Mill Industry

The annual report of the Bureau of Labor for the Province of Saskatchewan states that during 1914 the planing mills which were kept in operation in the province maintained only a portion of the regular staff; whilst in volume the output compared favorably with that of previous years. To a large extent the material used was of the cheaper or more common grades. The condition of the industry during the year is indicated by the following table:—

| Planing Mills | 1913 | 1914 |
|---|---|---|
| Number of establishments in operation. | 36 | 34 |
| Capital employed, including plant .. .. | $1,599,048.00 | $1,579,648.00 |
| Average capital employed ... ... ... | 44,418.00 | 46,460.00 |
| Number of employees ... ... ... .. | 864 | 782 |
| Total salaries and wages ... ... .... | $667,692.00 | $476,819.00 |
| Average annual earnings per employee. | 772.75 | 609.74 |
| Gross value of product ... ... ... .. | 2,445.504.00 | 1,660,686.00 |

# Production of Pulp Wood and Pulp

## Wood Pulp Output Shows Increase of 10.4 per cent in Quantity and a Few Cents in Average Price

A bulletin dealing with the production and consumption of pulpwood and pulp in Canada during 1914 has been prepared by the Forestry Branch of the Department of the Interior, and will be published in the near future. Extracts relating to the export trade in these products were published in the Canada Lumberman of June 1st. The following extracts relate chiefly to the domestic features.

In spite of the widespread disturbances to industry in general occasioned by the war, the manufacture of wood pulp in Canada is still on the increase. During the calendar year 1914 the quantity of wood used in this industry showed an increase of 10.4 per cent. over the preceding year.

The increase from 1910 to 1911 was 12.3 per cent., from 1911 to 1912, 28.8 per cent., from 1912 to 1913, 28.1 per cent., and from 1913 to 1914, 10.4 per cent. The relative positions of the five provinces on the list remained the same as in 1913. Increases took place in the consumption of wood for this purpose in Quebec (1.0 per cent.) and Ontario (39.4 per cent.). Over four-fifths of the wood consumed in Canada was made into pulp in these two provinces. Decreases in consumption were reported from the three remaining provinces as follows:—British Columbia (4.9 per cent.), New Brunswick (7.1 per cent.), and Nova Scotia (47.6 per cent.)

The average value of pulpwood at the mills in 1914 was $6.61 an advance of only a few cents from the value reported for 1913. The value increased in British Columbia remained the same in Quebec, and decreased elsewhere.

The following table shows pulpwood statistics for 1913 and 1914, by Provinces, quantity used, total value 1914, and average values 1913 and 1914:

| Provinces | Active Firms Reporting | Quantity 1913 Cords | Quantity 1914 Cords | Total Value 1914 | Average Value Per M Ft B. M. 1913 | Average Value Per M Ft B. M. 1914 |
|---|---|---|---|---|---|---|
| Canada | 49 | 1,109,034 | 1,224,376 | $8,089,868 | $6.53 | $6.61 |
| Quebec | 23 | 629,934 | 636,496 | 4,148,405 | 6.52 | 6.52 |
| Ontario | 15 | 321,244 | 447,751 | 3,172,235 | 7.15 | 7.08 |
| British Columbia | 2 | 84,173 | 80,013 | 426,444 | 4.77 | 5.33 |
| New Brunswick | 4 | 53,121 | 49,339 | 296,769 | 6.44 | 6.01 |
| Nova Scotia | 5 | 20,562 | 10,777 | 46,015 | 4.61 | 4.27 |

The woods most commonly used in pulp manufacture in Canada vary but slightly from year to year. The increased manufacture of sulphate of kraft pulp has enabled the manufacturers to use increasing proportions of jack pine. The use of balsam fir has increased steadily in past years. Hemlock is used to a greater extent than any other wood in British Columbia. In every other province but British Columbia spruce heads the list of woods converted into pulp.

### Relative Importance of Processes

The proportion of wood used in the manufacture of chemical fibre in Canada is steadily increasing. In 1910 only 22 per cent. of the wood was converted into pulp by the chemical processes. In 1914 this proportion had increased to 47.3 per cent., almost half the total.

In the mechanical process where the fibres are more or less broken and their strength impaired, only the best quality of pulpwood can be used. The machinery however, is comparatively cheap and easily installed, and so long as the supply of good pulpwood was convenient this process was largely used. Of late years the quantity of wood used in the sulphite process has steadily increased in spite of the high cost of installing the necessary plant. In this process the wood requirements are not so exacting, and the higher price for the pulp produced easily repays the cost of the plant.

The introduction of the sulphate or kraft process for the manufacture of coarse, strong, dark colored pulp for wrapping papers has permitted the use of jack pine and other so-called inferior species in a greater proportion than had hitherto been possible.

The following table shows the kinds of woods used for pulpwood during 1913 and 1914, by kinds of wood: Quantity used, total value 1914, and average value 1913 and 1914:—

| Kinds of Wood. | Active Firms Reporting | Quantity 1913 Cords | Quantity 1914 Cords | Total Value 1914 | Average Value Per M Ft B. M. 1913 | Average Value Per M Ft B. M. 1914 |
|---|---|---|---|---|---|---|
| Total | 49 | 1,109,034 | 1,224,376 | $8,089,868 | $6.53 | $6.61 |
| Spruce | 49 | 754,858 | 836,387 | 5,605,926 | 6.76 | 6.70 |
| Balsam Fir | 35 | 283,292 | 314,183 | 2,067,434 | 6.38 | 6.58 |
| Hemlock | 5 | 47,360 | 45,246 | 254,576 | 4.25 | 5.63 |
| Jack Pine | 3 | 19,383 | 24,715 | 135,762 | 5.25 | 5.49 |
| Poplar | 3 | 4,141 | 3,845 | 26,170 | 7.02 | 6.81 |

In 1913 the wood used in the mechanical process for the manufacture of ground-wood pulp formed 54.1 per cent. of the total consumption. This proportion was reduced to 52.7 per cent. in 1914. The proportion in the case of sulphite pulp increased from 33.1 to 35.5 per cent. remained about the same, but a decrease took place with the sulphate or kraft process from 12.3 per cent. to 13.9 per cent. The only actual decrease in quantity was in the case of wood used in the soda process.

### Increase in Wood-Pulp Manufacture

The estimated quantity of wood-pulp manufactured in 1914 was 934,700 tons, an increase over 1913 of 9.4 per cent. The increase in the manufacture of ground-wood pulp was only 7.4 per cent., while that of pulp produced by the three chemical processes was almost 14 per cent. Considering these three processes separately the increase was in the case of sulphite pulp, amounting to 11.8 per cent. of the production in 1913. The quantity of soda pulp estimated was a decrease of over a third from 1913.

Mechanical pulp is manufactured in all five provinces, Quebec leading with over sixty per cent. of the total. Sulphite pulp is manufactured in every province but Nova Scotia. Ontario leads in the production of this class of fibre with 53.3 per cent. Sulphate or kraft fibre is manufactured in Quebec, Ontario, and New Brunswick, Quebec producing also ninety per cent. of the total. Soda pulp is produced only in Quebec province.

In spite of the fact that Canada in 1914 produced nearly a million tons of wood-pulp valued at approximately twenty million dollars, and exported pulp to the value of over eight million dollars, we still import this commodity from other countries. The importations of wood-pulp in 1914 were valued at $426,601, an increase over the imports of 1913 of 19 per cent. Although the greater part of the material comes from the United States (51 per cent.) the value of imports from that country decreased by $87,182 in 1914. A decrease took place in the value of imports from Great Britain and no pulp was imported from Germany, but increases are to be noted with the other countries on the list, especially Sweden.

---

## Helping Forest Protection by "Movies"

An interesting departure has been made under the direction of the Hon. W. R. Ross, Minister of Lands for British Columbia, to make our people realize the great importance of the lumber industry and the necessity of protecting the forest resources of British Columbia from damage by fire. Last year a number of the motion-picture theatres in the province were supplied with a set of slides to be used in the intervals between the ordinary films, the pictures bearing the following legends, each accompanying a typical forest scene:—

"One moment, please." While waiting, resolve to be careful with fire in the woods."

"Only six trees (shown in picture) but their manufacture into lumber employed 100 men for one day. Put your fires out."

"$400,000 reward! Is what the lumber industry of the Pacific North-West pays the community daily for labor, supplies, etc. You share it. Be careful with fire in the woods. The road to prosperity lies through the forests; don't burn them up."

The slides were sent out under instructions from the Minister of Lands with a letter explaining the need for the co-operation of the theatre proprietors in order to reach a large body of the public inaccessible by any other means. The result was entirely satisfactory, both theatres and patrons expressing their appreciation.

This year the idea was extended, every motion-picture theatre in British Columbia receiving a set, the subjects being more direct in their appeals, as is shown by the inscriptions:—

(1) "**Wage Earners and Merchants!** The lumber industry already employs over half the wage earners in British Columbia, and distribute over twenty million dollars annually for labor and supplies. . . . . make it permanent by protecting the forests from fire (view shown of export sawmill with shipping)."

(2) "**Taxpayers!** Forests pay into British Columbia Treasury two and a half million dollars annually. . . . . Prevent fires, and keep your taxes down (logging scene)."

(3) "**Hunters and Fishermen!** Green forests afford shelter for game, and clear water for fish. . . . . Help keep them green (Forest Guard in canoe on patrol)."

In utilizing the motion-picture theatre on the lines described, a powerful agency has been recognized for reaching the general public. The posters displayed along the roads, and in the neighborhood of logging camps and sawmills are familiar to many, while the woodsmen and other followers of the open air life are reminded of the necessity for care with fire every time they use a Forest Branch whetstone.

The general public with its plans for holiday-camps, picnics and the like, will also be reminded of the fire danger, and will undoubtedly respond as good citizens and shareholders in the prosperity of the province.

---

It is expected that the camp cut of cedar in the Vancouver Forest district during the month of April in logs and shingle bolts will create a new record, according to reports which are now nearly completed. The number of handloggers has recently shown a great increase, and also the number of small logging camps.

# Hardwood Men Convene at Chicago

## Annual Meeting Largely Attended—Important Reports of the Year's Association Happenings

The annual convention of the National Hardwood Lumber Association was held at Chicago, Ill., on June 10th and 11th, and was exceptionally important and successful. The president, Mr. E. V. Babcock, in his address said in part:—

We have passed through probably the most discouraging year to make money in, that the members of this Association have ever had. It would seem that we have reached a point where any change for the lumbermen would be for the better. It would seem that the sun of prosperity is slowly but surely rising, although there are many who do not look for a restoration of business prosperity until we have a reenactment of a protective tariff and legislation to remove the many harsh provisions in the present laws regarding business. Letting Canadian and British Columbia lumber into our country free and paying seven and one-half (7½ per cent.) export duty on all lumber shipped there in return is neither reciprocal nor fair to American lumber manufacturers.

Can it be said that we lumbermen with our forty thousand saw mills, our seven hundred and eighty-five thousand employees, our annual output amounting to $1,600,000,000—greater than that of any other industry in this country, should not be considered in making up the laws of our land? Is it not time that we sat up and took notice with this very old, very large and very honorable business?

### Grading Matters Discussed With Consumers

Early in the year we were called upon by Mr. Robert W. Irwin, President of the Federation of Furniture & Fixture Manufacturers, to meet their organization in conference. In addressing us, he said: "We feel that as large purchasers of lumber we should have some part in, or rather be considered in the making of the rules which surround the purchase and sale of this product. We come to you in the spirit of constructive work. We are extremely anxious as manufacturers for the establishment and maintenance of standard grades of hardwood lumber, grades that will not be changed from year to year. We are not coming to you with any idea of asking for anything that in any way fixes or limits the price of your product. What we want and what we ask of you is some working agreement, whereby, when a set of rules are established, they can be maintained one year after another, so that the experience we accumulate under our cost system in our factories will be available from one year to another, and will not be thrown in the air because of changes in grades."

You will recognize this as a high-class, dignified request from a great, big organization of big and splendid business men. Up to this time they had refused to use our authorized rules for inspection. Their representatives were met by our Rules Committee. The two committees. after a long conference, agreed that the Federation would use our present rules for the inspection of lumber, and that the conferring about rules should be prosecuted throughout the next year.

### Rival Associations Getting Together

Again, our Officers and Directors were requested to meet the representatives of the Hardwood Manufacturers' Association of the United States, with a view of reconciling any differences between the two organizations and a hope that some common ground could be found whereby these two organizations could be amalgamated and at the same time the interests of all be protected.

These conferences with these sister Associations were taken part in by full committees representing our Association and by big and broad-gauge men representing their organizations.

While the endeavors to come to a mutual understanding with the Manufacturers' Association were unsuccessful, a vastly better feeling now exists between the two organizations than has apparently existed at any time past.

I say to you with considerable forethought that the existence of two rival hardwood organizations, antagonistic in some respects, is detrimental to the best interests of the members of each.

It is the expectation of your President, and probably of your other officers and Directors, that common ground will be found for constructive co-operation between the Federation of Furniture & Fixture Manufacturers. and the intense hope that common ground can be found for the amalgamation of the now rival hardwood associations, to the end that the interests of their members will be not only protected but enhanced and bettered.

### The Secretary's Report

The Secretary, Mr. F. F. Fish, in his annual report said in part:—

The popularity of impartially certified grades, evidenced by the bonded certificate of this Association, is steadily increasing among the producers and consumers of hardwood lumber, as the value of such grades are not problematic, but are already determined by competent authority, and there is at the present time a sincere desire on the part of a large element of the consuming trade to co-operate with this Association in its efforts to standardize grades of hardwood lumber permanently. This is the same element that one year ago was in open opposition to the work being performed by this organization. This desirable change in attitude has resulted from a better understanding of the aims and methods of this Association and further emphasizes the progress that has been made during the past year.

The common ground which the lumberman and his customer may jointly occupy is intelligence and honesty. Neither should seek to get the best of the other. The lumberman should deliver the grade he sels and the customer should accept the grade he buys. This disinterested offices of the National Hardwood Lumber Association enables each party to the transaction to achieve this desirable result with practical certainty.

There is a constantly increasing sentiment on the part of this membership against frequent and radical changes in the rules of inspection. A widespread feeling has developed that permanence is the element most desirable in accepted standards and the general belief prevails that the absolute value of this element more than offsets any ephemeral gain that might result to the lumbermen from further changes in the rules.

Since the Buffalo convention, June 18 and 19, 1914 (less than one year ago), 136 new applications for membership have been received, of which 9 were rejected on account of being ineligible or undesirable. The record of failures and withdrawals from business greatly exceeds that of any previous year in the Association history and numbers 141; 29 have been dropped on account of being delinquent in dues, and 13 have resigned. The total number of new members admitted during the year is 127, which brings the present number of members in good standing to 845.

The quantity of lumber inspected during the year was 119,600,756 feet. The earnings from this work amounted to $51,055.23, and its cost was $50,877.99. Of the 119,600,756 feet inspected, official reinspections were requested and made on 1,143,187 feet, and of that amount the original inspection was found to be in error on 260,294 feet.

Attention is again invited to the results being obtained in our reporting department, and the co-operation is urged of every member who has not been keeping in touch with this important branch of our work. During the past year the demand for service on this department from members now familiar with the service has materially increased, which doubtless due in part to the rather general uncertainty surrounding credit conditions and in many instances to the difficulty experienced in making collections. While the reporting department is not prepared to furnish promptly reports asked in every instance, a large number of late and thorough reports have been added to the files and the value of the reporting service has been substantially increased. It is now a recognized fact among students of credit information, that the interchange of ledger experience furnishes a more reliable basis for extending credits than any other method, and this Association, if granted the hearty co-operation of its present membership, would have access to nearly nine hundred ledgers.

---

## Record Imports of American Lumber at Hong Kong

The year's record in lumber imports at Hong Kong, China, especially in American lumber during 1914, was exceptionally good, especially of Oregon pine and other lumber from the United States, and were the largest in the history of the port. The total imports of lumber from the United States during the year amounted to 12,155,242 feet, of which 1,896,840 feet were of redwood sleepers and about 200,000 feet of spars, the remainder being of Oregon pine. The increase in imports in general represents actual increase in consumption, which is the result of an active campaign in behalf of American lumber and timber for various uses to which they have not been devoted heretofore in Hong Kong. There was an unusual amount of building in Hong Kong and vicinity during the year, which accounted for a considerable proportion of the increase, which would have been much greater had freight rates been more favorable. Freight rates during the year ranged from $6 and $6.50 to $7 gold per thousand feet at the beginning of the season to from $12 to $12.50 at the end of the year. Imports of hardwood during the year were below the average. There was a shortage in supplies of teak, resulting in an advance of about 20 per cent. in price. Imports of various Philippine hardwoods during the year amounted to about 3,500,000 board feet, which represents a large increase over the previous years. Imports of Borneo hardwoods aggregated about 10,000,000 board feet, 60 per cent. of which went to Canton. Imports of teak from Siam amounted to about 1,200,000 board feet.

---

A despatch from Kingston, Ont., states that the steamer Jones of the George Hall Company's fleet, recently arrived in Ogdensburg, N. Y., with the largest cargo of lumber that ever passed through the Welland Canal, the total being 1,750,000 feet of pine lumber, which was loaded at Sheldrake, Mich.

# Treated Wood-Block Pavement Its Advantage and Costs

A bulletin upon "Treated Wood-Block Paving," prepared by W. G. Mitchell, M. Sc., has been published by the Department of the Interior as Bulletin No. 49. The bulletin contains a great deal of interesting and valuable information regarding this important subject. It would not be possible in limits of our space to give a resume of the information which it contains. A few extracts, however, will be of interest. The experience of those cities of the United States where wood block paving has been most extensively adopted, the bulletin says, has shown that for many kinds of service creosoted wood blocks are entitled to a high place in the classification of road-surfacing materials. In 1905 the total area of such pavement in the United States was slightly less than 1,500,000 square yards, while in 1913 the city of Minneapolis alone had in use over 1,000,000 square yards, which indicates in a striking way the extent to which this type of pavement has grown in favor during the last decade.

The Forest Products Laboratories of the Forestry Branch of the Department of the Interior have under consideration an extended investigation of the possibilities of treated wood blocks for road paving, dealing with the relative merits of different native woods, details of seasoning and preservative treatment and methods of laying, having particular regard to the climatic and traffic conditions to be met in Canadian cities. It is the intention of this department to place under close observation several stretches of wood-block paving which are subject to representative conditions of service, in the hope of obtaining more or less direct correlation between the data gathered from periodical inspections and the results of laboratory investigations.

Pending the completion of such parts of this undertaking as will justify the publication of further reports, and to meet the present call for authentic information on the subject, this bulletin is offered largely as a compilation of the information available to date, and a summary of the published work of other investigators, whose experience with wood paving and wood-preservative treatment in general entitle their conclusions to the most careful consideration.

The essential requisites of modern city paving are durability, safety, low traction resistance and ease of cleaning. Considerations somewhat less important economically require that pavement shall be such that noise and vibration from heavy street traffic will not be excessive, and that such factors as the radiation of heat, reflection of light and emission of unpleasant odors will be minimized. On a basis of the foregoing requirements, modern treated wood-block pavement is regarded by many authorities as closely approaching the ideal.

### Cost Figures in Canadian Practice

Vancouver, Victoria, Calgary, Moose Jaw, Winnipeg, Toronto, Hamilton, Ottawa, and Montreal are among the Canadian cities where wood-block paving has been adopted to some extent. Douglas fir has been used almost exclusively on the Pacific Coast for paving-block manufacture. Hard (Southern or yellow) pine blocks have been imported by some of the Eastern cities, and Norway pine, tamarack and hemlock blocks are also in use. Birch and maple are regarded as valuable woods for such service by some authorities, although these species have not yet been adopted to any extent in Canada.

Initial and ultimate cost, durability, availability of supply and adaptability to conditions of traffic are factors upon which the choice of a pavement surface depends. The fact of availability of supply will influence Canadian practice, because of high transportation costs. In the East the supply of timber for paving-block manufacture will be drawn from Norway pine, tamarack, birch, hemlock, and maple. At the present time imported yellow pine blocks compare favorably in price with native wood blocks, but this is an anomaly due to present market conditions, and can hardly be expected to continue. The coast cities have hitherto used Douglas fir blocks almost exclusively. It is possible that such other species as tamarack or hemlock may replace fir for this purpose. At present there is a considerable diversity of opinion as to the suitability of Douglas fir for paving-block manufacture. Difficulties of treatment have hitherto been responsible for the development of some prejudice against this species, although it is claimed that this trouble has been overcome by recent improvements on methods of seasoning and impregnation.

The initial cost of wood-block paving is rather higher than for other types of pavement. Compared with asphalt surface on an equal foundation its first cost is considerably greater. The cost of wood-block pavement will vary considerably according to design, and more particularly in proportion to the cost of timber stock, cost of treatment and labor for construction. This variation ranges from $2.50 to $3.90 per square yard.

A cost-figure is reported from Minneapolis of $2.50 per square yard, representing an average of several years' construction. The cost of a 3-inch treated-block pavement in Moose Jaw is reported as $2.84 exclusive of excavation. Vancouver reports as low a cost as $2.10 per square yard, exclusive of excavation and foundation. In this case the cost per yard of treated blocks was $1.35, half of which represents the actual cost of treatment. The timber stock was Douglas fir and a twelve-pound impregnation was required.

These figures can hardly be assumed as representative of costs in the East. Probably a fair cost-figure in Eastern Canada would be from $3.25 to $3.85 per square yard for a 4-inch pavement on a 6-inch foundation. This cost is slightly higher than that of brick pavement, and approximately the same as that of asphalt block.

It is claimed by some of the most extensive and successful users of treated wood-block pavements that when properly constructed, the relatively high durability of such pavement liberally discounts the greater initial cost, and reduces ultimate cost to a figure which compares very favorably with other types of road surface. Remarkably low maintenance costs are claimed for treated-block pavements, some of which have been in use for ten to fifteen years. It may be said that there are no cases of American wood-block pavements laid according to best recognized practice, which have been in service for a sufficient length of time to yield conclusive information as to the ultimate life of such pavements. However, the performance records to date of well constructed wood-block pavements, under a wide variety of service conditions, are such as to commend them to the careful and impartial consideration of all highway engineers.

The Canadian wood-preserving industry is represented at present by four producing companies: the Dominion Tar and Chemical Company, of Sydney and Winnipeg, the Canada Creosoting Company, of Toronto, the Dominion Creosoting Company of Vancouver, and Alex. Bruce & Company, of Fort Frances, Ont.

---

## Consignee Loses Action Against Shipper

A case of interest to shippers and consignees has been dealt with by Mr. Justice Maclennan, at Montreal, the suit of the Drummond Lumber Company vs. the Standard Chemical Company being dismissed with costs. Briefly, the circumstances were that the plaintiff sued defendant for $5,786.57, which it alleged it had had to pay as extra freight on several shipments of wood made by defendant to plaintiff. Plaintiff alleged that, by the contract between the parties, the wood was to be in a fairly dry condition, and the cars were to be loaded up as full as possible so as to reduce the freight charges. It alleged that contrary to the contract, the logs were taken directly out of the water and placed on the cars, whilst the cars were not fully loaded up; this, said the plaintiff, resulted in increasing the freight charges to the extent mentioned.

The defendant admitted the contract, and declared that the logs were in fair condition when placed on the cars at the various points of shipment. It further pleaded that the wood was to be delivered to the plaintiff on the cars at the various points of shipment, and that, both by law and by the terms of the contract, the inspection of the wood and the acceptance or rejection of it was to take place at these points; that all the wood was delivered to plaintiff at the said points of delivery and was accepted without protest or complaint of any kind.

Mr. Justice Maclennan held that the place of delivery must be presumed to be the place of inspection by the buyer unless the contract otherwise provided. Thus, if the cars on which the wood was loaded by the defendant at the various points of shipment were not completely full, and if the wood when loaded was not completely dry or not in good fair condition for shipping, these defects were apparent and could have been discovered and established by plaintiff by inspection or survey at the points of shipment, and if these defects existed, plaintiff should have refused acceptance. By allowing the shipment to be made to points in the State of Maine, without inspection or after such inspection or survey as the plaintiff saw fit to make at the points where the wood was loaded on board the railway cars, the plaintiff accepted the wood and had no right to question the quality or the quantity of the shipments after arrival at their point of destination. The action was dismissed with costs.

---

The United States export only 7.1 per cent. of their annual cut. This distributed over several different woods shows for the annual cut of each:

| | |
|---|---|
| Redwood | 13.5 per cent. exported |
| Fir | 12.5 per cent. exported |
| Gum | 10.0 per cent. exported |
| Yellow pine | 9.8 per cent. exported |
| Oak | 7.0 per cent. exported |
| Poplar | 5.0 per cent. exported |
| White pine | 1.7 per cent. exported |
| Spruce | 1.5 per cent. exported |
| Cypress | 1.5 per cent. exported |
| All other woods | 2.2 per cent. exported |

The European countries received 41 per cent. of all that was exported or about 3 per cent. of the total U. S. lumber production.

## Brazil's Imports of Wood and Manufactures of Wood

Imports of wood into Brazil during the past four years were valued in paper milreis as follows:—1913, 14,197,039; 1912, 11,743,725; 1911, 8,077,532; 1910, 8,564,210. Imports of printing paper during 1914 amounted to 12,395,987 kilos, valued at 2,963,374 milreis. In 1913 the totals were 15,060,481 kilos, valued at 3,642,249 milreis. In order to convert milreis into dollars an approximate result can be obtained by dividing the total by 3. The following table shows the values in dollars of imports of wood and manufactures of wood into Brazil during 1914 and 1913:—

| Articles and principal countries of origin. | 1913 | 1914 |
|---|---|---|
| Furniture: | | |
| Total | $843,231 | $397,069 |
| United States | 90,353 | 74,882 |
| Austria-Hungary | 385,360 | 130,381 |
| Germany | 97,790 | 76,422 |
| France | 139,254 | 43,123 |
| Great Britain | 44,487 | 51,465 |
| Pine blocks, planks and boards: | | |
| Total | 3,488,555 | 976,959 |
| United States | 3,200,509 | 852,160 |
| Sweden | 182,388 | 68,357 |
| Canada | 48,181 | 522 |
| Staves and hoops: | | |
| Total | 237,981 | 52,557 |
| United States | 2,315 | 909 |
| Germany | 157,082 | 15,145 |
| Great Britain | 52,737 | 29,107 |
| Wood of all kinds, rough, sawed, planed, and veneered: | | |
| Total | $410,395 | $208,487 |
| United States | 12,641 | 5,710 |
| Paraguay | 9,215 | 4,148 |
| Norway | 7,004 | 36,704 |
| Sweden | 28,053 | 3,169 |
| India | 6,352 | 21,052 |
| Germany | 32,014 | 13,723 |
| Belgium | 220,978 | 167,202 |

According to a recent report from the United States Consular Agent at Santos, Brazil has been consuming in recent years between 6,000,000 and 10,000,000 feet b. m. annually of Swedish pine. The larger part of this is white pine, the remainder the well-known red pine of the Baltic region. The Swedish sawmills grade their pine into three grades: Firsts, seconds, and "brak." It is the first grade, clear except for a few small, sound, inconspicuous knots, that is sent to Brazil. The pines have considerable sap, but they are delivered entirely free from stain or discolorations and as bright as the day the lumber came from the saw. The Brazilians explain this as the result of particular care taken to ship the lumber according to specifications, "thoroughly air seasoned." All Swedish pine is said to be stuck-piled six months or longer before it is sent to South America.

The regular "Rio deals" 3 by 9 inches and of lengths varying from 14 to 20 feet (usually 14 feet) are typical as to size, and it is interesting to notice the uniform precision with which the lumber is manufactured to size. The price differs according to the market. It ranges from 14 to 18 pounds sterling per "standard," 1,980 running feet, or the equivalent of $34 to $44 per thousand feet. The principal use of the Swedish white pine deals is for boxes—soap cases in particular. The deals are resawed into thin boards and cut into shooks and the boxes made in the same factory that uses the cases. This wood is largely employed for temporary uses, and being soft and easily smoothed and cut, it is sought for odd jobs, repair work, concrete forms, etc. With the Swedish red pine it enters to a limited extent into the manufacture of doors and blinds and into planing-mill products, chiefly moldings for painted work and ceiling.

The effect of the European war on transportation from Baltic regions and the recent declaration of lumber as contraband have practically cut off Brazil from the sources of supply of Swedish pine. The stock on hand will not last long, and the lumbermen and exporters are looking for a substitute.

## Brazil Market for Printing Paper and Pulp

In a recent report written at Rio some two or three years ago, the attention of Canadian manufacturers of printing papers was directed to the possibilities which the Republic offered. It was pointed out how the trade had grown during the years immediately previous to that in which the report was written, viz., from 8,569 metric tons in 1903 to 16,406 tons in 1909, the last year for which statistics were available. In 1913 the imports amounted to 30,052 tons, which shows a growth of about 360 per cent in ten years. Germany has maintained her hold, and is credited with about 36 per cent. during 1913, Norway 18 per cent., Sweden about 13 per cent., and the remainder from the Netherlands, Belgium and the United Kingdom. For some reason neither the United States nor Canada seem to have been able to obtain any part of this trade.

When it is considered that Argentina and Brazil between them are in normal years importing about 60,000 metric tons, equal to 66,000 short tons, it will be seen that the trade is well worth cultivating. It is much to be desired that in the future, Canadian mills will make an effort to secure at least a share of this trade, as besides being profitable for Canadians, it would contribute very considerably towards providing tonnage for a line of steamers between Canada and South American ports.

A little over 6,000 tons of wood pulp were imported during 1913 into the Republic. Brazil manufactures a certain amount of paper, such as account and memo forms, colored paper and colored tissues, but all printing paper is imported and pays only a light duty.

The following tables give details of Brazil's currency and weights:

1,000 reis gold equals 1,700 reis paper currency.

1,000 reis paper equals 1 milreis paper.

1,000,000 reis equals 1,000 milreis equals one conto (paper).

One pound equals 15 milreis.

$1.00 equals 3.082 milreis, written 3$082.

$1,000,000 equals 3,082$000 or 3 contos and 082 milreis, written 3,082$000.

1 milreis equals 32.45 cents or approximately one-third of a dollar.

Note.—In regarding the trade returns, if the figures when in milreis be divided by 3, the result will approximate to the value in Canadian dollars. In calculating the trade returns, paper currency is employed.

1 kilogram equals 2.2046 pounds (2 1/5 lbs. approximately).

1,000 kilograms equals 1 metric ton equals 2,205 lbs. (1 1/10 short tons.).

## Canadians Seek American Outlet

A recent despatch from Boston, Mass., says: It is beginning to look very much as if the scarcity of tonnage would have a serious effect upon lumber prices in the domestic market. Now that it is becoming apparent that Canadian spruce can not be moved to British markets in the volume in which it is produced the provincial manufacturers are sending their representatives to New England and New York markets to find an outlet. The bulk of the product of the northern New England spruce mills is used right here in the East and the competition with the Canadian production would undoubtedly weaken prices.

More than 130s. a standard has been offered for little American coasting schooners to carry deals to England, and what few are secured are far from enough.

The falling off in arrivals of ships at Boston from 150 in May of last year to only 121 vessels this May just past, though there never before in the history of the port was such a brisk demand for bottoms to carry the huge exports to European countries, well illustrates the conditions.

## An Important Customs Ruling

The Customs Department at Ottawa recently made an important ruling in connection with shipments of lumber from Vancouver Island to Toronto. Our readers will remember that a large shipment of material for use in the Toronto harbor improvements was brought to Toronto from Vancouver Island on the steamer Robert Dollar, being trans-shipped by way of New London, Conn. The shipment consisted of nearly 5,000,000 feet of lumber, being the first of a large order. The customs ruling is that this lumber must pay a duty of 7½ per cent. The first shipment got through without having to pay the war tax, but the new ruling will affect future shipments which may come in by way of American ports. The Steamer Bessie Dollar took the second cargo of this shipment for New London and the steamer Atlantic is also on her way.

## Quebec's Forest Wealth

Hon. Walter Mitchell, provincial treasurer of Quebec, in a speech recently, drew a glowing picture of the future of the lumber and pulp industries of the province. He said the forest wealth of Quebec Province was the greatest of any province in the Dominion. In the whole of Canada there were 414 million acres of forests, and of these 130 million acres were in Quebec. So far only six million acres in the province had been touched. The forest wealth of the province was estimated at $600,000,000, and although development had only just begun as regards pulpwood, last year 61 per cent. of the pulp produced in Canada was produced in the mills of Quebec Province.

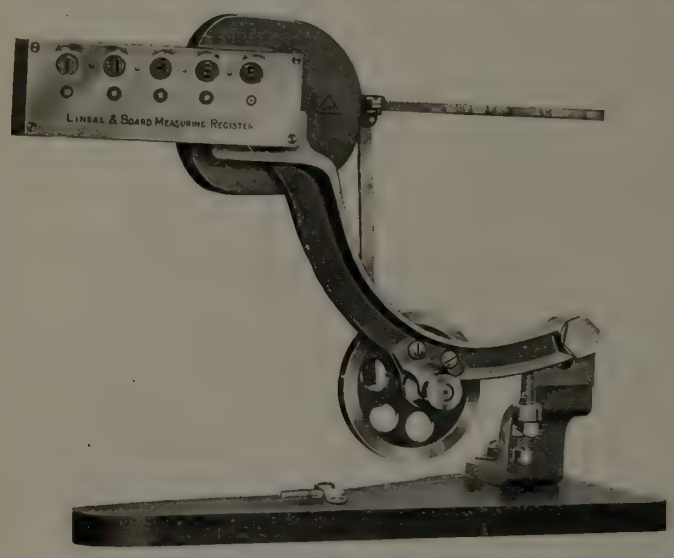
A forest fire on the North Branch Road, about 15 miles north of Port Arthur, Ont., destroyed a great deal of valuable timber during the last week in May.

# Machinery and Equipment

**What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing**

## The Morrison Lumber Measuring Register

A machine that should be in use in every planing mill, woodworking plant, furniture factory and sawmill, is the Morrison Lumber Measuring Register, placed on the market by the James Morrison Brass Manufacturing Company, Limited, of Toronto. This Register can be attached to the planer, moulder, resaw, sorting table or any other position required, and will measure the stock continuously, giving the result in board or lineal feet as desired. It is a labor saver that will save the cost of itself many times over in a short while, and not only will reduce the running expenses in the mill, but will keep an absolute tally on workmen, as at the end of the day one can see at a glance just how much lumber has been put through each machine.



**Morrison lumber measuring register for measuring lineal feet and board measure. Made also for lineal measure only.**

Each machine is solidly constructed with nothing to get out of order, and is guaranteed to be accurate in every detail. It can be instantly adjusted to any machine required. The Morrison Lumber Measuring Register is already in use by leading firms throughout Canada. Full particulars can be obtained by writing to the manufacturers.

## Dry Kiln Patents Upheld by Court

In a case known as Grand Rapids Vapor Kiln vs. Sidman, which has recently been decided in the United States District Court at Grand Rapids, Mich., a judgment of interest to our readers was handed down. Primarily the suit was one for infringement of patent No. 1,055,338 on vapor kilns, against the Johnson Furniture Company, Grand Rapids, Mich., which, the plaintiffs alleged, in June, 1913, erected a kiln under the plans furnished by the Sidman Company. The Grand Rapids Veneer Works, in a report of the judgment, advise us that the Court handed down a comprehensive opinion confirming the infringement and sustaining the validity of all but two minor claims of the Linn patent, under which the Grand Rapids Vapor Kiln is now made. The company state that they will now follow up all owners and users of Sidman kilns, and, after adjustment of royalty endeavor to give them the advantages of co-operation in the modernizing of their kilns and of consultation and inspection service enjoyed by all users of Grand Rapids Vapor Kilns. The company also state that during the trial it was shown that the efficient combination in the Linn patent of heating coils properly located, spray pipes, heated discharge stacks and downward circulation to produce the sweating or steaming operations in drying lumber was a distinct advance and discovery and was patentable.

The Heisler Locomotive Works, Erie, Pa., have issued an attractive illustrated catalogue No. 115, which will be interesting to many of our readers. Heisler locomotives are well known to Canadian logging companies for the remarkable manner in which they help to solve the difficulties connected with transporting logs from the limits to the sawmills. The illustrations in the new catalogue are very striking and convincing, giving one an excellent idea of the suitability of these locomotives to their varied lines of work.

## Simonds Canada Team the Winners

During the past season much interest was taken in Montreal in the competition among the various teams making up the Manufacturers' Bowling League. Readers of the Canada Lumberman will be interested in learning that the winner of the city championship was the team representing the Simonds Canada Saw Company.

## Carborundum at the Panama-Pacific

Prominent among the remarkably interesting and instructive exhibits in the Palace of Machinery at the Panama-Pacific International Exposition at San Francisco is the display of the Carborundum Company, Niagara Falls, N.Y. The accompanying illustrations give some idea of the attractiveness of the display, but beauty of construction and arrangement were not the sole ideas in planning the exhibit. Industrial education was the big idea embodied, for any visitor to the Carborundum exhibit will surely learn some valuable lessons regarding the many and wonderfully varied uses to which Carborundum products are put.

In brief, the plan of the exhibit is to show a wide variety of materials and products in their crude or unfinished state and after they have been cut, ground or finished with Carborundum products. The result has been a wonderful collection gathered from manufacturing plants, not only in this country, but from South America, England, India, New Zealand, Australia and other foreign countries. The collection embraces materials and products ranging from tooth picks to flooring, from flour mill rolls to needles, from steel shafts to watch dials, from beautiful semi-precious stones to shrapnel shells and malleable castings and also includes samples of marble, onyx and granite, pearl, cut and engraved glass, sueded skins and boots and shoes, and in the grinding, shaping and finishing of every piece shown Carborundum products have played their important part. In each case the particular Carborundum product which did the work is shown.

To display attractively the hundreds of products, a space of about 1,400 square feet was necessary. The materials are shown in full glass mahogany-trimmed show cases. The exhibit is railed off with

**Carborundum Company's fine exhibit at the Panama-Pacific Exposition.**

heavy silk cords of green strung from newels. The back of the exhibit is a classic colonnade, supported by fluted columns finished in old ivory enamel.

In the centre of the exhibit is a wonderful fountain. This fountain, which is shown in the illustration, is built of irregular masses of the wonderfully iridescent Carborundum crystals over which real water plays, splashing into a marble basin, the coping for which was moulded with Carborundum wheels. The jewel-like fountain is twelve feet high and is strikingly beautiful.

Visitors to the Panama-Pacific Exposition will surely find it well worth their while to spend an hour at the Carborundum exhibit.

## The Zelnicker Bulletin

The Zelnicker Bulletin issued by the Walter A. Zelnicker Supply Company, St. Louis, Mo., is an important weekly announcement of bargains in various lines of locomotives, cars, journal boxes, tool steel, spike mauls and many other lines of products handled by this important supply firm. Readers of the Canada Lumberman will do well to get in touch with this firm when they are in the market for such supplies as it handles.

## Maples Limited

Maples Limited, of Toronto, are particularly equipped this season to supply the camp trade with maple syrup, mince meat and jams. Their new four-storey factory at the corner of Vanhorne and Dufferin Streets, is equipped with the very latest facilities and their output has found favor with the trade from coast to coast.

## Milk for the Camp

During the last few years the process of evaporating or drying the water from liquid milk has been more and more perfected, so that today it is possible to take fresh liquid cow's milk, pasteurize it, and immediately remove all of the water, leaving the solids. Owners of lumber camps, and men working in lumber camps, should know more about milk; what it is, and what the causes are for the existing milk problem. 87½ per cent. of the best fresh, liquid milk is pure water. The other 12½ per cent. is made up of the solids of fresh liquid milk. If you remove this water the resulting product is a dry milk. Milk in powder form has come into general use where ordinary liquid milk is used. Companies having construction camps, boarding houses, hotels, and lumber camps, have found milk in powder form to be the cheapest and best form of milk that has yet been produced.

The product most largely used is a separated milk powder made by a process that has been in use for about five years. This process produces a powder that is perfectly soluble in water. When this powder is dissolved in water in the proportions of one pound to every seven pints or nine pounds of pure water it makes a liquid that can barely be distinguished from fresh liquid milk. In this reconstituted liquid form the camp can have at a moment's call a milk suitable for tea, coffee, cereals, and any use for which ordinary fresh, liquid milk is commonly used. For cooking, such as making all kinds of pastry, pan cakes, puddings, etc., the best results can be obtained by using the milk powder dry with other dry ingredients, such as flour and sugar, then add water where milk would otherwise be added in the recipe.

The advantages to be obtained from the use of milk powder are many. As the powder can be bought at about 20c. per pound, and as one pound will make a gallon of liquid, it is possible, the manufacturers assert, to obtain milk in the most remote parts of Canada at 4½c. per quart, or 20c. per gallon. Milk in this powder form will not freeze. It is not affected by heat.

The manufacturers of this milk powder in Canada have had samples analyzed by the Dominion Government, and advise us that the results published by the Government showed that their powder is genuine, and that no preservatives, chemicals, or adulterations of any kind are used in making it.

In buying milk in powder form freight is paid upon 99 per cent. of dry product, and not on a product the large proportion of which is pure water, which is the commonest article to be obtained in the woods without any cost.

Canadian Milk Products Limited, Mail Building, Toronto, produce milk in powder form specially for lumber camp use, which is known as "Klim." The name is understood by speillng it backwards. This powder is put up in convenient sizes of containers to suit the different requirements of the lumbermen.

## Chinese Markets for Canadian Lumber

Mr. James C. Shields, Kamloops, B. C., well known in the lumber manufacturing industry of British Columbia, recently returned from a lengthy visit in the Orient. Speaking of the markets for lumber in Japan and China, Mr. Shields said:—

Lumber offers a steady and good paying market. Outside ornamental trees in private grounds there is hardly a stick of timber growing in China. Away back before history began to be recorded the inhabitants of the country cut down the timber, and, as apparently the population has always been great, the consumption overtook the first growth and left the country denuded. Unlike Japan, there are no measures looking towards reforestation. In Japan it is the law that whenever a tree is cut down another must be planted to replace it, and this applies even to a bamboo. While China has to import all her lumber Japan is an exporter of both hardwood and pine, and has undertaken some very large contracts for the supply of railway ties. Up the Yang-tze River in China there is imported each year some 180,000,000 feet of lumber, about a quarter of the lumber demand for the whole of China. This waterway, with its connecting canals, give inland navigation for a distance of over 2,000 miles, some of the canals still operated having been built over a thousand years ago. With these canals in active use the country can do without railways, for the sampans which carry the freight inland are navigated at such a slight cost that railway carriage can hardly compete with them. On the banks of this river and along the canals you can see Chinamen whip sawing logs of wood, delivered from Manchuria, most of them just the same as they did hundreds of years ago, but cheap as their labor is, lumber from our mills could be landed there to advantage.

The Puget Sound and Columbia River mills get most of the Chinese business in the lumber trade, not because they sell cheaper than we do, but because they have frequent sailings of regular lines of steamships. These vessels often have extra space aboard not occupied by commodities taking a higher freight rate and they fill up with lumber, and naturally the mills nearest the ports of call of the steamers get the business. Most of the United States firms also have established connections in China, and the buying is done through agencies at that end, for the changing values of Chinese currency do not appeal to the Canadian or American business man. To the Chinese merchant, however, the exchange is an attractive gamble.

Dr. Ross, the Canadian Trade Commissioner at Shanghai, the only one in China representing this country, is making every effort to establish British Columbia timber over there, and hopes to work out his problem before long. He has not had, however, a great deal of encouragement. In one case where, after a great deal of effort, he succeeded in securing an opening order for railway ties, treated by a special process, after the order was placed the Canadian firm securing the business got another order and quietly turned down that for China, leaving the railway there to find another source of supply just about the time the consignees were expecting delivery from this country. Needless to say, Dr. Ross does not expect to secure any more orders of this kind after having fallen down so disastrously.

## Quebec Cullers' Report

The following comparative statement of timber measured and culled to date, is furnished by the Supervisor of Cullers, Quebec, P. Q., under date of June 3rd:—

| | 1913 Cubic Feet | 1914 Cubic Feet | 1915 Cubic Feet |
|---|---|---|---|
| Waney White Pine | 5,720 | 52,520 | 28,200 |
| White Pine | 40 | ..... | ..... |
| Red Pine | ..... | ..... | ..... |
| Oak | 560 | 32,240 | 56,400 |
| Elm | 29,480 | 96,960 | 44,840 |
| Ash | 840 | 480 | 480 |
| Birch and Maple | 47,680 | 50,800 | 42,200 |

## Quotations for Boxes Required in England

Mr. H. R. MacMillan, the Special Commissioner investigating the possibilities for the sale of Canadian lumber abroad has cabled the Department from London that quotations for 300,000 boxes for delivery at Melbourne, Australia, are required, shipments to take place monthly commencing in October. Canadian manufacturers are requested to cable their lowest quotations c.i.f. Melbourne inclusive of war risk, insurance and 5 per cent. seller's commission. The measurements and other specifications of the kind of boxes required are as follows: Inside measurement 17¾ inches x 11⅞ inches x 6⅝ inches; tops and bottoms, 7/16 inches thick may be in three pieces, tongued and grooved, glued or in one piece at the option of the supplier. The sides to be 9/16 inches in one piece, the ends 11/16 inches in one piece. The wood should be unprinted, of good quality and smoothly sawn.

## Commissioner of Commerce Confers with B.C. Lumbermen

Mr. Richard Grigg, Commissioner of Commerce, Ottawa, is on a visit to British Columbia, during which he has been conferring with representatives of the lumbering industry and with the Vancouver Board of Trade on subjects of vital importance to the lumber industry. One of the matters which was taken into consideration at a conference between Mr. Grigg and Victoria, B.C., lumbermen, was the proposal to appoint a Canadian Customs official at the port of New York. This would do away with the necessity for paying duty on lumber shipped from British Columbia by way of the Panama Canal and New York to a destination in eastern Canada. With a customs official at New York this lumber could be sent through in bond. During the conference with the Victoria lumbermen, Mr. Grigg gave details regarding the chief requirements of the United Kingdom in the way of lumber at the present time. Mr. Grigg's visit is a proof of the desire of the Dominion Government to co-operate with the Provincial Government in promoting the welfare of the lumber industry of British Columbia.

# WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## Wanted-Lumber

### Wanted to Buy

Inch Cedar suitable for boats. Box 184, Canada Lumberman, Toronto. 9-12

### Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

### Wanted

Three hundred thousand feet of one inch and two inch spruce, and three hundred thousand feet of one inch and two inch No. 1 Hemlock, advise stating prices, lengths and widths. Box 202, Canada Lumberman, Toronto. 11-12

### Wanted—Rock Elm

250,000 to 350,000 feet of 10/4 No. 1 common and better, standard lengths, 6 ins. and wider. Will take the stock green or dry. Address American Lumber & Manufacturing Company, Pittsburg, Pa. 9-12

## For Sale-Lumber

### Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
c Montreal, Que.

### For Sale

PILING, any length in Spruce, Red, White and Jack Pine or Hardwood.
Telegraph Poles, Ties and Fence Posts. Square Cedar and Hemlock up to 12 in. x 12. Correspondence solicited.

ANGUS PRENTICE & SON,
189 Arthur Street,
9-14 Toronto, Ontario.

### FOR SALE
### Norway and Jack Pine—Mill Run

| | |
|---|---|
| 1 x 4/5 x 10/16 ft. | 1,000,000 ft. |
| 1 x 6 | 500,000 ft. |
| 1 x 8 | 85,000 ft. |
| 1 x 10 | 14,000 ft. |
| 2 x 4 | 165,000 ft. |
| 2 x 6 | 220,000 ft. |
| 2 x 8 | 320,000 ft. |
| 2 x 10 | 218,000 ft. |
| 2 x 12 | 65,000 ft. |
| Norway Pine Culls | |
| 1 x 4 and up x 10/16 ft. | 1,500,000 ft. |

DEVON LUMBER CO.,
lt.f. Ottawa, Ont.

### We Have a Full Stock

of Hardwood, Hemlock and White and Norway Pine Lumber, Norway and White Pine Piling, up to 60 ft. Keenan Bros., Limited, Owen Sound, Ont. 3t.f.

## For Sale—1914 Cut

40,000 ft. 1 x 10/12 in., Mill Cull White Pine.
40,000 ft. 1 x 4, 12/16 ft. Box and Com. White Pine.
90,000 ft. 1 x 4/6 in. Mill Run Red Spruce.
25,000 ft. 2 x 6, 10 x 16 ft. No. 1 Spruce.
48,000 ft. 2 x 4 to 8 ins., 19/16 ft. No. 1 Spruce.
A close price will be made on any items.

THE ELGIE & JARVIS LUMBER COMPANY, LIMITED,
12 Toronto, Ontario.

## For Sale
## Dry Stock

10 cars 8/4 Hard Maple, No. 1 Common and Better.
10 cars 12/4 Hard Maple, No. 1 Common and Better.
10 cars 4/4 Hard and Softwood. Sound Crating.
10 cars 4/4 Basswood, runs well to white.
5 cars 4/4 Soft Elm.
3 cars 4/4 Brown Ash.
10 cars 6/4, 8/4, 12/4 and 16/4 No. 2 and 3 Common Maple.
25 cars 4/4 to 8/4 Hemlock, all sizes.
5 cars 4/4 Mill Cull White Pine.
5 cars 4/4 Mill Run White Pine.
The above stock is well milled and end trimmed, good widths and lengths.
Prices low to a satisfactory buyer.

HALL BROS.,
15-15 174 Mutual Street, Toronto.

## Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra.
Minimum charge 25 cents

Band Saw Filer wants Position. A1 reference; fifteen years' experience. State what you have in first letter. Address A. W. Woodward, 57 Kirkwood Street, Akron, Ohio. 9-12

WANTED—Position by experienced Band Sawyer. Sober. First-class reference. Address Frank Weston, P. O. Box 59, Odanah, Ashland County, Wis. 9-12

Highest grade accountant, 20 years' experience in public works and lumber, now chief accountant in Ontario, wants change, Ontario or elsewhere. 40 years old, married. Highest references and securities. Box 210, Canada Lumberman, Toronto. 12-17

### Position Wanted

Band sawyer wants position. Single or double cut. Best of references. Used to fast rigs. Can come at once. Box 204, Canada Lumberman, 119 Board of Trade, Montreal. 11-14

## For Sale-Machinery

### Woodworking Machinery For Sale

1 No. 51 Crescent universal woodworker; 2 24-in. planers and matchers; 3 12-in. buzz planers; 1 12-in. four-side moulder; 1 No. 802 Canada Machinery Corporation shaper; 5 30-in. Ideal pedestal bandsaws; 2 No. 619 Canada Machinery Corporation saw tables; 1 36-in. double drum sander; 1 20-in. American wood scraper.

H. W. PETRIE, LTD., Toronto.

### Machinery for Sale

One Double Surface Planer.
Power-Feed Rip Saw.
12-in. Moulder.
Heavy Flooring Machine.
Vertical Boring Machine.

A. J. LINDSAY,
11-13 92 Pembroke Street, Toronto.

### Rebuilt Veneer Machines

We have the following rebuilt veneer machines ready for immediate shipment.
1 Coe Lathe, 50-in. swing, 88-in. knife, 6-in. spindles.
1 Coe Lathe, 50-in. swing, 64-in. knife, 5-in. spindles.
1 Coe Lathe, 50-in. swing, 76-in. knife, 6-in. spindles.
1 Coe Lathe, 42-in. swing, 60-in. knife, 3½-in. spindles.
1 Coe 100-in. Power Clipper.
1 Coe 54-in. Power Clipper.
1 Coe Type A. Stamper.

These machines are decided bargains and carry the same guarantee as we give our new ones. Prices on application.

THE COE MFG. COMPANY,
Painesville, Ohio.

## Business Chances

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf

## Miscellaneous

## Tenders for
## Pulpwood Limit

Tenders will be received by the undersigned up to and including Wednesday, the fifteenth day of September, 1915, for the right to cut pulpwood on a certain area situated north of the Transcontinental Railway, west of Lac Seul and south of English River in the District of Kenora.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of 40c. per cord for spruce, and 20c. per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory, and to manufacture the wood into paper in the Province of Ontario—the paper mill to be erected within such time and in such place as the Lieutenant-Governor in Council shall direct.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into an agreement to carry out the conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

N.B.—No unauthorized publication of this notice will be paid for.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, June 5th, 1915. 12-17

### Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

### For Sale

Copies of "The Preservation of Structural Timber," by Howard F. Weiss. Published in 1915 by McGraw-Hill Book Company. 312 pages, illustrated. Price $3.00. Canada Lumberman, 347 Adelaide Street West, Toronto.

### Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

### Stave Markets in France

The principal stave markets of France are Marseilles, Cette, and Bordeaux, which supply the viticultural regions of the Republic. While the Bordeaux barrel stave is the one most in demand in those markets, the larger staves, however, are practically the only ones used in the consular district of Havre, about 80 per cent. of the importations at this port being extra heavy pipe staves. These came mainly from Texas, Arkansas and Louisiana, and are shipped as dunnage in vessels bringing cotton from Galveston and New Orleans. There exists, however, a demand for other staves in Havre, and the kinds mostly imported here, together with their dimensions in inches, are: Triple extra heavy pipe, 60 by 5 by 2; extra heavy pipe, prime, 60 by 5 by 1½; culls, 60 by 5 by 1½; extra heavy culls, 60 by 5 by 1½; pipe culls, 60 by 4 1¼; light pipe culls, 60 by ¾ by 1; extra hogshead, 48 by 4 by 1½; hogshead culls, 48 by 4 by 1¼; extra claret, 40 by 4-5 by 1½; claret culls, 40 by 4 by 1¼; extra barrel, 33 by 4-5 by 1½; French claret (faconnes), 44 by ¾ by 1½ and 36 by ¾ by 1½.

Staves, to meet the requirements of this market, should be of white oak in the rough, even in quality and dimensions, well seasoned, clean, dry, and free from worm holes and other defects. There is little or no demand for the finished stave. Almost all the staves imported into Havre from the United States are shipped on consignment. Few shipments are made for cash; but in such an event the shipper draws for 80 per cent. of the amount of the invoice against documents giving a discount of 2½ per cent.

## Exports for Eleven Months Ending with February

The latest figures showing exports of wood and manufactures of wood from Canada are for the eleven months ending February, 1915. They include the following total values which are for goods of Canadian produce only:—

Lumber—

| | | 1913 $ | 1914 $ | 1915 $ |

| Totals | 5,813,641 | 6,460,821 | 9,194,419 |

The total exports of wood and manufactures of wood for the eleven months were valued as follows:—

| | 1913 $ | 1914 $ | 1915 $ |
|---|---|---|---|
| United Kingdom | 10,598,743 | 11,744,285 | 11,180,693 |
| United States | 32,475,865 | 31,426,992 | 35,195,254 |
| Other countries | 3,581,207 | 3,344,465 | 1,978,819 |
| Totals | 46,655,815 | 46,515,742 | 48,354,765 |

## Wood Imports into France

Imports into France during 1913 and 1914 included the following, the ton referred to being the metric ton of 2,204.6 pounds:—

| | | | | |
|---|---|---|---|---|
| Wood: | | | | |
| For building | 1,562,179 | 34,208,000 | 819,000 | 17,925,000 |
| For furniture | 80,171 | 3,350,000 | 63,205 | 2,543,000 |

Driving conditions on the Nashwaak River, N.B., are reported to have been good.

## Samples of Wood Paving Block

Particulars with reference to the requirements of wood blocks for street paving in the United Kingdom were published in Trade and Commerce Weekly Bulletin No. 584. It was stated that tenders are invited periodically by the various municipalities and Canadian firms interested were advised to communicate with the surveyors of the largest cities and towns in the United Kingdom. The details of a specification issued by one municipality and the requirements with reference to the creosoting of the blocks were also given. By way of further reference to these particulars Mr. J. E. Ray, Trade Commissioner at Birmingham, has forwarded to the Department samples of the wood-paving blocks which may be taken as a fair indication of what is in general use among the municipalities of Great Britain with but slight differences in sizes. The sample blocks which have been forwarded are uncreosoted although it is stated that the majority of municipalities in the United Kingdom buy them already creosoted.

Canadians interested in this matter may inspect a sample of the blocks in question at the Canadian Manufacturers Association, Toronto, or at the Board of Trade, Vancouver, B.C. Other samples are being retained at the Department of Trade and Commerce, Ottawa, where they may be inspected on application. (Refer File A-883).

## An Interesting Forestry Bulletin

An interesting circular (No. 11), entitled "The Relation of Forestry to the Development of the Country," by Mr. R. H. Campbell, Director of Forestry, has been published by the Forestry Branch, Department of the Interior. The circular deals in an interesting manner with this subject, and concludes as follows:—While an argument from the experience of Europe or Great Britain cannot be transferred to Canada without consideration of the different conditions, it is quite clear from the study I was able to make during the past summer of this question in the Old Country, that for the best development of a country both in industries and in population, it is necessary to have a proper balance between the agricultural, grazing and forest interests, and that these are not necessarily antagonistic but should be mutually helpful.

## Lumberman Wins Case Against Railway Company

Judgment has been given by Chief Justice Mathers at Winnipeg in the case of Dutton vs. Canadian Northern Railway, in favor of the plaintiff for $41,000 and costs. The action was brought to recover loss by fire which the plaintiff sustained at his sawmill in Greenwood River, Sask., on May 20th, 1910, when it was claimed that sparks from the smoke stack from one of the railway company's locomotives started a fire on the right-of-way which finally spread to the plaintiff's limits, destroyed property of large value, standing timber, logs, logging camp outfits, etc.

## Canadian Trade Holding Up Well

According to a statement recently issued by the Department of Trade and Commerce the grand total of Canadian trade for the fiscal year ending March 31st, 1915, was $1,078,173,240, as compared with $1,112,562,107 for the previous fiscal year, a specially good showing in view of the dislocation of the world's trade by the war and the unfavorable economic conditions which prevailed previous to the war. A significant fact brought out by the Government's statement is that during the last month of the fiscal year, namely March, a decided improvement was noticeable, the trade total being $110,540,998, as against $92,887,053 in March, 1914.

## Many Sailing Vessels at Halifax

A recent despatch from Halifax, N. S., gives an idea of the strong demand now existing for tonnage and of the manner in which sailing vessels are assisting. During three previous days there had arrived from European ports no less than six barques and one full-rigged vessel. The total number of arrivals of square-rigged vessels shows that the sailing craft have gone into the trans-Atlantic trade with a vengeance. When the above despatch was sent there were twelve barques at Halifax loading deals for trans-Atlantic shipment.

## B. C. Shipping Lumber to San Francisco

A despatch from Victoria, B. C., states that a shipment of 900,000 feet of lumber is being sent to San Francisco on the Schooner Graywood from the Genoa Bay mills. This is said to be the first large direct cargo of lumber to be shipped from Vancouver Island to San Francisco, and it is expected that other ships will be chartered for further business. The same despatch states that a strong demand exists in Australia for lumber, and numerous schooners and square-rigged vessels are being chartered on the Pacific Coast for the Australian trade.

Despatches from Prince Albert, Sask., tell of disastrous bush fires in the neighborhood of Hudson Bay Junction. One report states that the Ruby Lake timber limits had been destroyed and that Greenbush was in danger. Fire had also done great damage in the limits of the Great West Lumber Company.

# Review of Current Trade Conditions

### Ontario

In the lumber trade of Ontario, as in every other line of business, conditions have reached what may almost be termed a normal war time nature. While the volume of trade is not so large as we were rather confidently hoping for a month or two ago, there is sufficient going on to keep the trade from anxiety. The normal situation among retailers to-day is a fair movement of stocks for consumption in work which is essential. Retail stocks are sufficient for such a trade, and the movement from wholesalers to retailers can be taken as being more closely on a par with the movement out of the retail yards to consumers than it has ever been before. Throughout the province the best trade continues to be in the districts where country trade, i.e., that of the farmers is the chief factor. The farmers however, are not loosening up to any exceptional extent as one would expect them to do in view of the low prices which they can secure to-day.

Manufacturing conditions show no alteration. A good deal of last winter's rather heavy cut will be brought to the mills this year, although there are many reports of logs having been hung up. This will reduce the output to some extent below earlier estimates, but there is no question about the volume of new stock this year being sufficient for the market. If anything the situation is expected to be of the opposite nature. In a normal year present conditions would be healthy so far as the manufacturers are concerned, but this year, with the shortage of tonnage for export, one already hears discussion of the possibility of stocks cut for export being likely to come on the local market.

There is no alteration to report either in prices or demand. Stocks of all kinds are on a level at which the wise course to adopt is to accept what trade comes without seeking to stiffen the demand or to secure orders by depressing prices. This is not to say that a fair volume of trade is not going on, but that anxiety to secure orders at someone else's expense is not the best policy to pursue. A feature of present conditions is the tendency it has developed among all branches of the trade to tighten up, or rather to reorganize credits. There is a general feeling that with the reduced volume of orders to-day the logical course to adopt is to see that one gets paid promptly for the stock he delivers, a course which is especially wise in these days and ought to be more general than it is at all times.

The lumber trade at Ottawa continues quiet, the only activity of note being a moderate demand from the United States. All the mills in the Ottawa Valley are working at full capacity and the water is high. The high ocean freight rates are still presenting a great difficulty in connection with shipments to England. The trade with the West Indies and South America is very quiet on account of scarcity of money in those countries and the shortage of vessels.

### Eastern Canada

At Montreal the lumber trade is experiencing a lull although some of the trade are looking for improvement soon. It is significant of present conditions that instead of discussing the volume of building permits one hears discussion of individual permits, upon each new one of which the trade bucks up and renews its stock of courage. Large contracts involving dimension timbers are very scarce. Export shipments by the regular liners are light, as the Government are using so great an amount of the available vessel space. Most of the exports are spruce and birch. Ocean freights are still showing an upward tendency, the present quotations from Montreal being 150 shillings per standard. In spite of the great demand there has been for spruce deals in England, the difficulty in making shipment is commencing to have an effect upon the market, and reports have been heard of prices being easier, also of a portion of the stocks originally meant for the Old Country being more likely to find their way into the Eastern States.

The base quotation, Boston rate, on railroad shipments of spruce dimension was dropped recently to $23. This is the result of the large output of the smaller mills, which apparently are glutting the market. Other conditions were considered good for a steady and active market, but the over-production of the small mills is apparently too extensive. There is a good, steady demand for eastern spruce frames from New England and New York yards. The shortage of tonnage also has resulted in freer offerings of New Brunswick and Nova Scotia spruce, which ordinarily would have gone in the form of deals to the United Kingdom. Stocks from this source consist mostly of random running to short lengths and do not bring quite so good prices as domestic production. Current random quotations are 2 x 3, 2 x 6, 2 x 7, $21; 2 x 4, $22; 2 x 8, $22.50; 2 x 10, $24; 2 x 12, $24.50. There is a plentiful supply of spruce boards at Boston and prices are weak. Good covering boards are bringing $19.50 to $20, and matched boards 10, 12, 14 and 16 ft. are bringing $21 to $22. Wholesale shingle dealers at Boston think that they are suffering on account of the anti-shingle campaign, as they feel that they are not getting the customary amount of trade, considering the extent of the building operations in progress. Good white cedar extras are offered at $3.35 and sometimes less; clears at $2.75 to $2.85; second clears at $2.40 to $2.50. Red cedar good extras are offered at $3.25 to $3.50. Lath are selling steadily, but offerings are heavy. For 1⅝ in. the usual price is $4.10, and for 1½ in. $3.75.

### Great Britain

Recent English advices tell of rather quiet conditions in the timber trade. Holders of stock are apparently in less hurry than formerly to dispose of the small amount in their possession, as there is a feeling that changes in the international situation may cause prices to rise still further. There is a belief, however, that the days of rapid changes of 10s. or 20s. per standard are over, and that the trade has accommodated itself in a great measure to war conditions. Under these circumstances merchants are expected to continue their policy of following the market closely and keeping their stocks at a low level. Deliveries at London docks during the week ending May 22nd amounted to 4,224 standards, as compared with 4,982 standards in the corresponding week of 1914.

Arrivals of fairly good proportions are noted in the latest reports from Liverpool. During the last week regarding which news was available, over twenty vessels brought timber either as full or part cargoes, and of these, seven were sailing craft. Three of the sailing craft arrived with cargoes of spruce. Several small sailing vessels were also reported with spruce deals from New Brunswick and Nova Scotia. The difficulty in securing freight for spruce deals seems to be as great as ever. A large proportion of the shipments which had reached Liverpool at latest reports were already sold, but there was great delay in discharging cargoes on account of congestion at the docks resulting largely from the inability of the railways to handle all the traffic. The c. i. f. market for spruce deals at Liverpool is rather curious. Freights are firmer than ever, yet shippers have recently sold cargoes at less than they would have accepted c. i. f. a few weeks ago. These prices are reported to be from 5s. to 10s. per standard less than former prices. The difference is probably due to the fact that the freights on these particular shipments did not touch current quotations. This situation has had an effect upon spot values, especially at Manchester, where the demand is not so keen as was expected. Indications in connection with hardwoods are that prices will increase steadily along all lines as they have during the past few months.

The timber market at Glasgow has been rather quiet of late. Arrivals of spruce have been a little too heavy for the market and some stocks have been stored. Values are not quite so firm as they have been. The opening arrivals for the season from Quebec have consisted almost entirely of deliveries of contract goods, chiefly pine and spruce deals and birch logs. It is reported that some of the parcels of birch do not look very attractive. Values of hardwoods continue to advance in sympathy with the increasing freight rates. Stocks of all kinds of hardwoods are exceptionally light.

### United States

The political developments of the last fortnight have had the effect of checking to some extent the steady development of domestic industry and trade in the United States. The entrance of Italy into the war, the probable entry of Roumania and Bulgaria at an early date, the unsatisfactory reply of Germany to President Wilson's note, and the note sent to Mexico, were all important factors, and have combined to produce the slowing up of industrial development. Since the opening of the war, however, the general industrial and commercial situation in the United States has been so effectively reorganized as to enable all these events to pass by with only a mere fraction of the effect which they would have had under different conditions. The latest estimate showed that actual orders for war material, as yet unfilled, but which will be filled and paid for before the goods leave the United States, amount in value to about $500,000,000. The steel industries of the United States are fairly active on a profitable basis. Over 75 per cent. of the steel plant capacity is now employed. A

# BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

***"Rush Orders Rushed"***

## Cleveland-Sarnia Sawmills Co., Limited

**SARNIA, ONTARIO**

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

100 per cent. capacity is never employed, so the situation is about normal.

The lumber trade is looking more and more to the domestic markets, as the lack of vessels for shipment makes the export markets difficult and uncertain to handle. Prolonged rains and cold weather in the Mississippi and Missouri Valleys have recently made the retail lumber trade rather slow. This is only a temporary handicap, however. The general belief is that the crop this year will be very much the same as that of last year. There is abundant evidence that the demand for lumber from the country and agricultural districts will be large and active. Confidence in the future of the retail trade is well established. Country retailers have been buying steadily, but not extensively. Their purchases are, however, unquestionably in excess of their current sales, indicating a certain amount of stocking up so as to be ready for future business.

Weather conditions have interfered to some extent with the distribution of northern soft woods for retail yards, but there has been a fairly satisfactory wholesale movement. Receipts at Buffalo and Tonawanda by water are about up to the average. Some of the Lake Erie markets have been active buyers.. Prices are about steady. The best movement has been in Illinois, Indiana, Michigan and Ohio. The eastern spruce situation is rather unsteady, partly on account of the inability of manufacturers in eastern Canada to make their export shipments to the United Kingdom and France, as vessels are so scarce. It is thought that, if these goods cannot all be shipped across the water, an effort will be made to dispose of some of them in the United States. Spruce manufacturers of Maine and New Hampshire, therefore, are afraid that their markets may be cut into seriously. Great quantities of spruce are being used in the construction of trenches, bomb-proof shelters, temporary roads and walks along the front. This material is practically gone forever.

The hardwood market continues quiet with no alteration worth mentioning in the demand or in prices. The movement, if any, is in the direction of slowly increasing requirements. An unusually large percentage of hardwood is going into boxing and crating for the shipment of war materials.

# Market Correspondence

**SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD**

## Ottawa Mills are in Full Swing

Ottawa, June 8th (Special to the Canada Lumberman):—Outside of a medium demand for lumber from the United States trade is quiet in this district at present with no immediate prospects of improvement. Locally, there is little to report. All the mills on the Ottawa River and its tributaries are working full swing and the water is higher than it was at this time last year, but is falling, and if rain in considerable quantities does not come soon, operations may be handicapped to some extent.

Though there is a demand for certain grades of lumber in England, the high ocean freight rates, the scarcity of bottoms and other factors due to the war are proving a serious handicap to Canadian exporters. The freight rates from Montreal to Liverpool, which were, before the war, from $4 to $6 per thousand feet, are now from $17 to $20. Added to these high charges is a war risk of from 1 to 1½ per cent. ad valorem and the insurance on the freight rates, which has gone up four times. In the face of such high charges buyers in England are naturally only purchasing what they must have. The business to the West Indies and South America is practically nil just now, owing to the scarcity of money in those countries, and the difficulty in getting boats. The freight rates to South America have advanced about 35 per cent.

In spite of the fact that there are no immediate prospects for a market for their lumber, which is being cut at their mills, lumbermen in Ottawa are employing practically the same number of men this season as in other years. J. R. Booth has about 2,000 men working at his plant and on the river, and their wage bill amounts to about $135,000 per month.

A large part of the business section of the Village of Russell, Ont., which is about 20 miles from Ottawa, was wiped out by fire last Sunday morning. The loss will amount to about $75,000, which is fairly well covered by insurance. The town hall, county registry office, Bank of Hochelaga, several stores and dwellings, were among the buildings destroyed. The cause of the fire is unknown. It started in a tinsmith's shop owned by R. W. Murray, and from there spread rapidly owing to the limited machinery in force to prevent it. The buildings are to be rebuilt without delay.

A dispute over some land alongside the Gatineau River on which the Dominion Government erected booms to facilitate lumber operations, was before the Supreme Court last week, the case being that of Leamy vs. the King. The Leamy family of Hull, Que., claim about 25 acres of sand and sandbars on the bed of the Gatineau River in the Township of Hull, granted, it is claimed, with certain land adjoining, to Philemon Wright, a pioneer settler in the district. The government denied the right of the bed of the river to the Leamy family. Judgment was reserved.

Two other cases also came before the court during the week, and in both judgment was reserved. One was that of McCall vs. the Canada Pine Lumber Company, the action arising out of the sale of lumber by the company for McCall. At the original trial judgment was given in favor of the company and McCall's counterclaim was dismissed. This judgment was upheld in the Appeal Court, but McCall took the case to the Supreme Court of Canada. The other case was that of Grant Campbell and Company vs. the Devon Lumber Company. The former firm arranged to cut and haul the pine on certain limits in Borden Township, Ont., for the latter company. Grant Campbell and Company held that the contract was not lived up to and the trial judge gave judgment in their favor. This devision was reversed in the Court of Appeal.

## Quiet Trade Continues at Montreal

Montreal, June 9th (Special to the Canada Lumberman):—For the moment there is a decided lull in the lumber market. There is reason to believe, however, that it will improve in the near future. There are two or three good building contracts in sight, one of which will require a very heavy amount of lumber. Owing to the paucity of large works, the dimension timber section is very quiet. Trade with the United States continues to be satisfactory. For last month, building permits totalled $529,171, this being a decrease of $1,787,977. The total for the five months is $2,394,998, a decline of $3,983,313 as compared with 1914.

Owing to the demands on the shipping companies by the Imperial authorities, comparatively small amounts of lumber are being sent to the United Kingdom in regular liners. In consequence of this scarcity of space, one firm has chartered another vessel of the Canada Steamship Lines, Limited. Spruce and birch form the great bulk of the lumber being shipped, pine going over in small quantities. Rates show a hardening tendency. One hundred and fifty shillings per standard have been asked, and the chances are that there will be a further advance before the season is over.

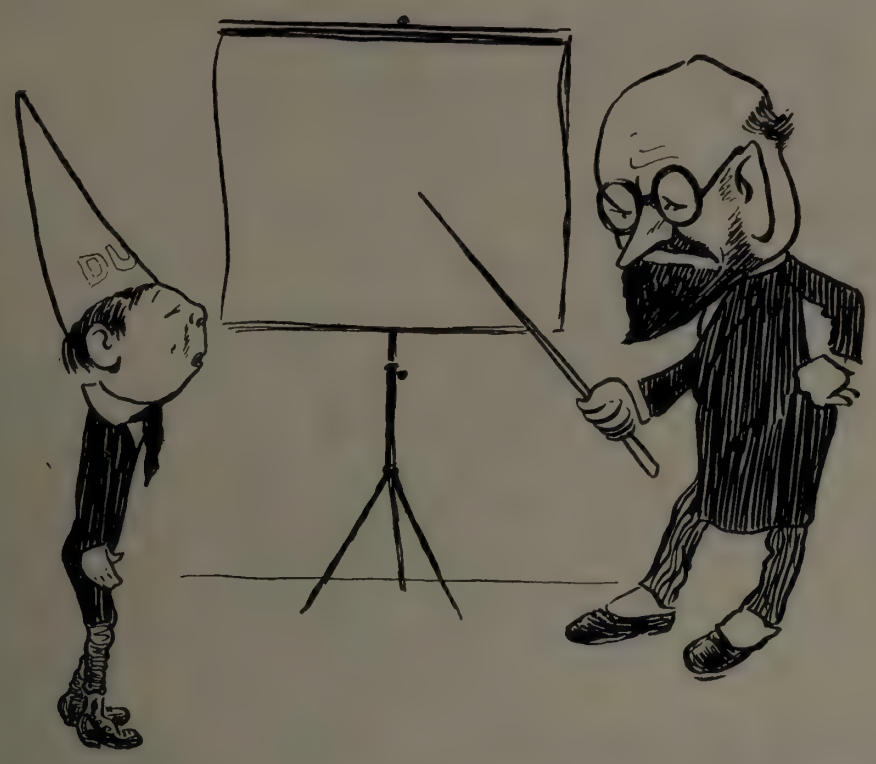
The Gres Falls Company, Three Rivers, have decided to rebuild their sawmill and mill for cutting up pulpwood which were recently destroyed by fire.

The British Guiana Government are desirous of introducing to Canada native woods suitable for furniture and veneers, and have sent to a former official living in Montreal six samples of the woods.

Several fires have occurred in the St. Maurice Valley district, giving a large amount of work to the St. Maurice Forest Protective Association.

Mr. Leon Gagne, Jr., sales manager of the Canada Lumber Sales Company, Limited, Montreal, is at the head of a movement inaugurated by the Chambre de Commerce to abolish level crossings in the city. He recently presided at a dinner held for the purpose of bringing pressure to bear upon the civic authorities and railway companies to abolish these crossings, which are held to be dangerous to life and inconvenient to traffic.

Mr. J. H. A. Acer, the chief representative of the Laurentide Company, Limited, in Montreal, is on the provisional board of directors of the Export Association of Canada, Limited, being formed with a capital of $500,000, to promote Canadian export trade. The Government, railways and large industrial organizations have promised to co-operate. The activities of the association will not be restricted to manufactured goods, but will also embrace assistance to trade in agricultural and natural products. Attention will be directed to the French and Belgian markets which will open up, particularly during the reconstruction period, and also to the immense Russian market opening up for manufactured goods of all kinds. Further extensions of the activities of the association to markets such as those of South America, India and the Far East will be made from time to time, as the opportunity seems favorable and the resources of the association permit. Offices will be opened in Canada and in London, England.



# A HARD LESSON

For many people to learn is how to buy right, that is to obtain the greatest value for every dollar expended. This is more true of lumber than most commodities.

Price does not establish Value. You know from experience that some of the most expensive material you have ever bought was purchased at the cheapest price.

Our business has been built up on a "value" basis. We aim to give the fullest possible value for each and every one of your dollars.

***THAT ORDER PLACED WITH US INSURES***

## Household Uses for Wood

By Joseph B. Knapp

The multiplicity of the present and prospective uses for wood in the modern household would indicate this to be a considerably neglected, although fertile, field for the extensive development of the utilization of lumber and wood products.

Man instinctively desires to produce for himself those articles of household use which are conducive to comfort and convenience. He takes enjoyment in the expenditure of effort which rapidly materializes in the finished work. The ease and rapidity with which wood is shaped into desirable forms, even under the manipulation of an unskilled hand, prompts the immediate thought of wood when some household article is required or is to be repaired.

Wood has been the primary article of use by mankind in providing the conveniences and comforts of life, and will continue to be as long as it is made easily available, or at least as easily obtainable as the ordinary substitutes.

Except for the ordinary structural parts, few households are supplied with articles made of wood, not essential, but highly desirable in making the household complete. Among such wooden articles might be mentioned fruit stands, card tables, book racks, kitchen utensil racks, clothes chests, closet shelves and trays, shoe boxes, firewood boxes and coal boxes, children's play pens, vegetable boxes, flower boxes, fruit-closets, flower stands, toy furniture and many others.

Furthermore, in most houses there is a lack of facilities for the storage of fuel, food products and wearing apparel. Such storage space can be provided by the construction of bins, closets or chests in the basement or attic of homes without the expenditure of particular effort by the householder. All are of such a nature that the layman, although inexperienced in working wood, is sufficiently skillful with his hammer and saw to construct them and obtain pleasure in the work.

The desire is generally manifest, but the accomplishment of the purpose is almost invariably deferred because of the extreme inconvenience confronting the city dweller in obtaining the necessary raw material without undue expenditure of effort and at reasonable cost.

If lumber were more readily available in small quantities, undoubtedly enormous amounts would be consumed in household use to provide some of the articles previously mentioned, and many others, which would add to the home comforts or household order. It is not necessary that this market be developed through the encouragement of the layman in the exercise of his efforts to produce articles of wood, but by a concentration of effort on the part of lumbermen to supply the wood within easy reach of the user.

The retail yard accomplishes this result in a minor degree in small communities where it is not located far distant from the houses. In the larger cities and towns the delivery cost for a small bill often exceeds the cost of the material itself, or at least forms a good portion of the delivered cost. The retailer can not afford to deliver small quantities of lumber for the householder's use except at a fair cost, because all such orders would be special and generally urgent.

To stimulate the use of lumber for household purposes some means must be found whereby the material can be placed in the hands of the householder in short order and in small quantities without abnormal charge for delivery. Many methods of accomplishing this have presented themselves to those interested in developing such a field of wood utilization. One of three methods, hereafter outlined, would apparently serve the purpose with great satisfaction.

That great institution, the modern department store, is responsible in a very large degree for the successful introduction and sale of many commodities of almost universal use to-day. The diversity of the products obtainable from department stores and the concentration of their delivery service permits this institution to serve the public most economically. The variety of products handled and distributed through department stores would indicate that these institutions could also serve as a distributing medium for small orders of lumber. The fact that lumber in any desired length, width and thickness might be obtained and delivered within twenty-four hours by ordering from some department store would, without question, stimulate the use of lumber in the household. Department stores need not carry large stocks, but if provided with racks containing lumber of short lengths and various widths and thicknesses, a few standard patterns of molding and lattice, they could easily serve this class of trade and replenish the supply from day to day or from week to week from some correspondent retail yard or planing-mill. It could often accept larger orders than are ordinarily required in the household by referring them to the correspondent retail yard or planing-mill and delivering through the regular delivery service.

Planing mills or sawmills located in populous communities might serve this household trade by motor delivery on short order, or might establish regular delivery routes, covering specific territory on certain days of each week and advertising this fact so that the householder might anticipate his wants, phone his order, and receive the material on the day the route on which he lives is covered. This regular service would attract patronage and would induce the use of wood, where otherwise the pleasure of the article desired would be indefinitely postponed or entirely abandoned.

It seems highly probable, also, that a "wood products" retail store, conducted in some similar manner as the old-fashioned dry-goods store, might also be a successful enterprise. Suppose an enterprising merchant obtained a site for a retail store and put in a stock of wood products of all kinds, carrying lumber of standard width, thickness and variable length, moldings, lattice, wooden bowls and other articles of wood such as kitchen utensil racks, baskets, ironing-boards, clothes racks, porch boxes, sink drainboards, bread boards, axe handles, hatchet handles, snow shovels, and numerous other wooden products. A retail store of this kind giving regular delivery service would undoubtedly be received with great pleasure and instant patronage by the public.

The spring of the year particularly finds a marked demand for flower boxes and compartment vegetable boxes in the household. These two articles could most readily be provided in knocked down form, tied in bundles like box shooks, and with a small can of paint and a bundle of nails attached, would find ready sale; with the householder making up his boxes and painting them, all materials furnished at a flat cost, delivered. The plan of the modern 5, 10 and 15-cent store of holding special sales of certain articles should appear in advancing the sales of these knock-down wood boxes, desired by everyone and had by few.

The volume of lumber which may be consumed in homes is manifestly a matter of conjecture and would undoubtedly amount to considerable volume when properly pressed. The census of United States in 1910 reported that there were 17,805,845 occupied dwellings in this country, inhabited by 20,255,555 families. If each household consumed an average of fifty feet of lumber, the total consumption would be 1,012,777,750 board feet, about 2½ per cent. of the total quantity of lumber sawed annually in the United States. The possibility for consumption of lumber in household uses assumes astonishing proportions when the diversity of the uses is considered and the normal desire of the householder is anticipated.

The writer himself, although no expert as a wood-worker, has discovered the fascination and pleasant diversion of wood-working, and the ideas presented have resulted from personal experience in the difficulties of obtaining lumber with which to work. If more readily available, instead of using approximately 200 feet of lumber in the past year, 400 feet might have been used.

The idea of supplying the householder with his lumber requirements is by no means original, but is a presentation of the thoughts of many who have cast about for a means for developing and stimulating the lumber trade.

---

## Market for Canadian Wooden Goods in England

In addition to varied correspondence received from Canadian shippers of general lumber since the beginning of this year, inquiries have also come to hand, says a Trade and Commerce report, from Canadian manufacturers seeking information as to the market for miscellaneous wooden goods, as follows: Match splints, cloth rolling boards, veneer, coat-hangers, toys, handles for hammers, axes, sledges and picks. Considerable correspondence has arisen, and in some instances preliminary trial orders have been placed. Whilst there is a wide market for manufactured wooden articles in the United Kingdom, the supply rests almost entirely upon the question of price. More especially is this the case in regard to the cheaper articles for domestic use, such as pastry boards, clothes-pins, cutting boards, broom handles, washboards, rolling pins, towel rollers and similar lines, the question which is of most concern to the dealer being that of price in comparison with the goods he already handles.

The following are some of the diverse lines of wood goods for which a market exists:—

Oak staves are in demand in sizes ranging from 18 inches upwards in length by 4 inches upwards in width, the thicknesses being ⅝-inch, 1-inch, 1⅛-inch, 1¼-inch, and 1½-inch. These staves should be made from quartered white oak and are used in the manufacture of churns, casks, and for tight-work generally.

There is also a large consumption of square bars for spool-making. The bars should be taken from birch or rock-maple, the former in lengths of from 2 feet to 4½ feet and from 1⅛-inch to 2-inch squares, and the maple bars in multiple lengths of 6 inches with squares ranging from 1¼ to 3 inches.

A market also exists for maple roller blocks used for wringing and washing machines. The sizes vary from 22 inches to 26 inches long and the diameters from 4 inches to 6½ inches. Canadian lumber firms already supply this market with these blocks. Other articles in demand are skewers (of hickory); perforated chair sets in "round," "square," and "shaped" designs; picture mouldings; wood casings for electric lighting; wood pulleys and box shooks in miscellaneous sizes.

# SUPPLIES

WE are continually having in mind, when buying goods, that there are special requirements in the way of goods that are needed by lumbermen. This is the reason why you can always rely on our having a good supply of the lines that you want for the Camp. Here's a list.

**90/100 Prunes 25 lbs.....6¾**
**Choice Yellow Peaches 50 lbs.....5¾**
**Choice Natural Figs 28 lbs.....5¾**
**Sair Dates 60 lbs.....4¼**

## H. P. ECKARDT & CO.

**WHOLESALE GROCERS**

**Church St. & Esplanade, TORONTO**

## KLIM

**(Spell it backward)**

**The Lumberman's Milk—Ideal for the camp**

"Klim" is a pure separated milk in powder form and is unexcelled for camp use for the following reasons:

It is easily, quickly and conveniently prepared. It has a pure natural milk flavor, just like fresh milk. "Klim" is not harmed by heat or freezing and will keep indefinitely, even after the tin is opened. "Klim" can be used for everything in place of liquid milk. It is one-third the cost of condensed milk.

Used in all the soldier camp kitchens from Victoria to Halifax. Packed for camp use especially in 10 lb. tins $2.00 each. 1 lb. makes one gallon of liquid. Large quantities special prices.

Write for free sample and full information.

**Pittsburgh**

## Kiln Drying Common Lumber

By C. C. Bronson, of the Day Lumber Company, Seattle, Wash.

As far as I have been able to learn and from over thirty years of actual experience the only method of reducing common lumber to shipping weight has been to cross pile the stock in yards, so that it could be air dried. This necessitates carrying enormous stocks, running in some cases into hundreds of millions on which insurance, taxes and carrying charges must be paid. On the Pacific Coast it is only within the last few years that even this method has been used, for when I first came to the coast, twelve years ago, a stock of 5,000,000 was a large one, which meant that thousands of cars of stock were shipped green.

In attempting to avoid shipment of green common boards and dimension we were prompted to investigate the possibilities of kiln drying this class of stock. We found that no matter how large a stock we carried there were always items of which we were short and which we were obliged to ship green, and I think this is true of most mills in the Pacific Northwest.

We believe we have solved a problem that has cost the fir mills thousands of dollars annually and has added just that amount to the revenue of the railroad companies, to say nothing of the dissatisfaction of the customer in being obliged to handle green stock. It is a safe estimate to say that the amount of green dimension shipped annually from the State of Washington that could have been kiln dried amounts to at least 600,000,000 feet, and, based on an average freight rate of 40 cents, the saving would amount to $960,000. This figure is based on 2,500 pounds a thousand, which we find to be the average weight of all sizes of green dimension. On the other hand had the same amount of lumber been kiln dried, basing the freight on 2,100 pounds a thousand, the average weight of kiln dried stock, there would have been a saving to the mills of Washington of nearly $1,000,000 annually.

We do not advise the kiln drying of all fir dimension, for there is stock with which better results can be secured by air drying. For this reason we make three grades of dimension, as follows: kiln dried stock, air dried stock, and No. 2. The stock is all surfaced one side and edge as usual and graded as carefully as possible. No allowance is necessary for shrinkage, as it is no more in kiln drying than in air drying. To avoid expense the stock to be kiln dried is piled dead on the trams until it is wanted for orders and is then loaded into the kilns. The air dried and No. 2 stock are handled in the usual way. Our experience in cutting from sapling and young old growth fir is that about 70 per cent. is suitable for kiln drying, 25 per cent. for air drying, and 5 per cent. for No. 2. We also apply the same rule to common boards and shiplap, both in fir and hemlock.

### Loss Due to Green Lumber

With hemlock shiplap we have secured the most startling results, having made shipments on which the underweights amounted to better than $3 a thousand on a 40-cent rate of freight. In contrast to this a shipment of green hemlock shiplap was brought to my notice on which the overcharge amounted to $90, and an additional allowance was made to the customer of $30 to cover the expense of piling, making a loss of about $4 a thousand to the mill, and a net loss of $7 a thousand. This might have been avoided by kiln drying.

Another good example is rough 3 x 12—16-inch. On this item, of which large quantities are shipped, we reduced the weight of the green stock 700 pounds a thousand, making a saving of $3.50 a thousand if shipped on a 50-cent rate of freight. The same results are possible with rough, small timbers. In fact, we have dried timbers up to 12 x 12 and 40 feet in length.

You will be interested in knowing how these results are secured. We use the Grand Rapids dry kilns. These kilns are more expensive than the standard type of kilns, having about twice the amount of pipe. They require 13,200 feet of 1-inch pipe, and 46 horsepower boiler pressure is used when the kiln is operated to full capacity. Our two stall dimension kilns, 10 x 104 x 9 feet high, cost approximately $5,000, and are built of tile with wood roof. These kilns handle 35,000 feet a day.

The cost of kiln drying dimension varies, but it is safe to figure it will not exceed 35 cents a thousand, including loading the lumber in and out of the kilns. This cost can be materially reduced under the right conditions. For example, our kilns are all of the progressive type; that is, at the same time a load is discharged from the dry end a green load is put into the kiln, but I think better results could be secured with a single charge kiln. By this I mean the kiln should be filled to its full capacity and allowed to remain until ready to discharge, which in our case is three days; then all the lumber should be removed and a new charge of green lumber put into the kiln. In this way the temperature remains even, and the drying process continues without interruption. We claim that with our method we accomplish in three days what would take in air drying at least four to six months, depending upon the weather conditions; and best of all it enables us to give our customers dry stock regardless of the season or weather conditions.

### Details of Handling Dry Kiln

We find if in loading the stock into the kilns the crossings are kept even and regular and placed at the extreme end of the stock, there is no twisting or checking, and each piece will come out practically straight. In fact, as good results are secured in this respect as could be had in air drying the same class of stock. In operating the kilns a temperature of 180 degrees is maintained in the green, and of 190 degrees in the dry end. The live steam is allowed to penetrate to about 40 feet, and is kept at any necessary point by the system of drafts and ventilators. The stock is held in the live steam about thirty-six hours. The steam pressure on the kiln pipes is from 15 to 20 pounds, and is held at this point by an automatic reducing valve.

While this paper deals with common lumber, I will state that we are able to kiln dry silo and 2-inch and 3-inch clear tank stock with only a small percentage of loss on account of checking. In the upper grades of fir in 1-inch we have almost eliminated checking and kinking.

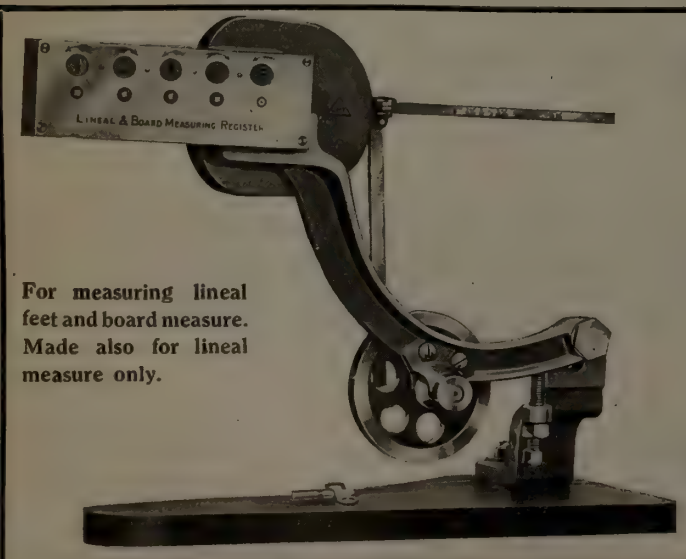
We deem the kiln drying of lumber one of the most important branches of the manufacturing end of the lumber business, and in order to secure the best results we find it profitable to have a man in charge of our kilns who understands the principle of kiln drying with this system and is competent to operate the kilns properly so that the temperature and humidity are kept at the right point.

Our experiments have extended over a period of about eighteen months, and we have now reached a point where we can say we have passed the experiemental stage, and kiln drying common lumber will be our regular practice, and will extend to other mills.

---

### Patriotic Year at the Canadian National Exhibition

The Canadian National Exhibition, which will be held from August 28th to September 13th this year, will mark a great epoch in the history of the patriotic service. This year is essentially a patriotic year, and every event that marks its progress must breathe the spirit of patriotism and imperialism. At the Exhibition this year will be exhibited for everyone to see, all kinds of German Kultur, from the helmets of the much vaunted Uhlans to the barbarous device, the asphyxiating gas bomb. Big guns that had done their deadly work before they fell into the hands of our soldiers; shells of every calibre; helmets and uniforms taken from the bodies of dead Germans; in fact everything that Krupp's have been able to create will be shown at the Exhibition this year.



For measuring lineal feet and board measure. Made also for lineal measure only.

# Morrison Lumber Measuring Register

## A LABOR SAVER

This register can be attached to your planer, moulder, resaw, matcher, your sorting table, or any other place you require. It will automatically and continuously measure your stock, giving the result in lineal or board measure as desired. It can be used for either filling small orders or for totalling the day's run.

The Morrison Register can be used in the sawmill, planing mill, furniture factory, woodworking plant or lumber yard. This register is solidly constructed and guaranteed accurate. Used by many of the largest concerns in the country.

# EDGINGS

## Ontario

The Rodney Woodenware Company, Limited, Rodney, Ont., recently suffered a loss by fire.

The planing mill belonging to D. Barker on Second Avenue, North Bay, Ont., was destroyed by fire on June 10th.

The Thorold Pulp Mill, Thorold, Ont., which was destroyed by fire last December, and has been rebuilt, was started up on May 31st and is now running night and day.

The Thomas Wilson Lumber Company, Limited, Ottawa, Ont., has received a Dominion charter to carry on business as manufacturers and dealers in timber and woods of all kinds.

A report from Hudson Bay Junction states that The Ruby Lake Lumber Company recently lost all its camps and 15,000,000 feet of lumber as a result of extensive bush fires in its neighborhood.

A cheese box factory belonging to John E. Playfair, Playfair, Ont., was recently destroyed by fire. The loss on the building amounted to $1,500. The machinery was also destroyed. The company will rebuild

The Pembroke Lumber Company, Pembroke, Ont., report that the loss by the recent destruction of their planing mill by fire amounted to about $70,000, which was fully covered by insurance. They do not intend to rebuild the plant for some time, but will install a small planing mill plant to take care of their dressed lumber orders.

## Eastern Canada

"Letourneau, Ltee.," lumber dealers, have been incorporated with head office at Grand'Mere, P. Q.

Mr. Manning Smith has finished his lumber cutting operations at Waterside, N. B., and is removing his mill to Hastings, N. B.

The assets of the Upton Sash & Door Manufacturing Company, Upton, P.Q., are being advertised for sale by tender on June 21st.

The Gres Falls Company, Three Rivers, P. Q., have decided to rebuild their sawmill and mill for cutting up pulpwood which were recently destroyed by fire.

The sawmill belonging to Adelard Dubois at Hebertville, P. Q., County of Lake St. John, was destroyed by fire on June 10th. The loss amounted to $25,000.

The sawmill on the Eel River stream near Kirkland, N. B., formerly owned by John Kennedy, was recently destroyed by fire. The present owner is Mr. Buckingham.

The sawmill belonging to Rodrigue Deschambault, at St. Jerome, P. Q., was recently destroyed by fire, the loss amounting to $10,000. Mr. Deschambault will rebuild the mill and will require new machinery.

The Canadian Box Mills, Sherbrooke, P. Q., are considering the erection of a plant at a cost of from $10,000 to $15,000 for buildings and equipment. Information can be secured from E. C. Gatien, Town Clerk, Sherbrooke, P.Q.

The Nicolet Falls Pulp & Lumber Company, Danville, P. Q., had a narrow escape from losing their plant by fire recently. The fire broke out in the roof and after about an hour's work it was extinguished with slight damage as a result.

A forest fire is reported along the line of the International Railway on Crown lands along the borders of Restigouche and Victoria Counties in New Brunswick. It is stated that much valuable timber has been destroyed and the villages of Hazen and Five Fingers wiped out.

Under instructions from the Eastern Trust Company, liquidators of Dickey & McGrath, Limited, the property of the company, including about 50,000 acres of land on and near the Tusket River, the sawmills, steam tug, scows, lumber, general store and blacksmith shop, were sold at auction by William Law & Company at Yarmouth, N. S., recently. The bidding started at $5,000, and reached $14,000, at which the property went, to James McG. Stewart, of Halifax, representing the Royal Bank of Canada, which has a claim of $83,000.

Announcement is made in New York of the formation of the North American Pulp & Paper Companies, a Massachusetts trust with an authorized issue of $2,000,000 par value, 6 per cent. preference shares of $100 each, and $1,000,000 common shares without nominal or par value. J. E. A. Dubuc has been elected president, and John H. Duffy, vice-president. The executive is as follows:—W. H. Clark, John H. Duffy, Hon. George T. Oliver, J. E. A. Dubuc, Parmly W. Herrick, George W. Robertson and W. H. Sharp. It is stated that the North American Pulp & Paper Companies acquired control of the Chicoutimi Pulp Company (which carries control also of the Chicou-

timi Freehold Estates, Ltd.); the St. Lawrence Pulp & Lumber Corporation, both located in the Province of Quebec; and the Tidewater Paper Mills Company of Brooklyn, N. Y. The Canadian companies have an annual capacity of 90,000 tons of mechanical pulp, and 36,000 tons of sulphite pulp. They own an area of Crown license and freehold land adjacent to tidewater of 1,360,000 acres. The Chicoutimi Company, at the head of the Saguenay River, also owns 50,000 horse-power water power, of which 27,500 is developed and operated in connection with its mechanical pulp mills. The Tidewater Paper Mills Company has a capacity of 27,000 tons of newsprint paper.

## Western Canada

F. W. Crossley, lumber dealer, Gladstone, Man., has sold his business to the Corona Lumber Company, Limited.

The firm of Powell & Egland, Cabri, Sask., has been dissolved. The business will be continued by Mr. O. B. Egland.

A despatch from Nelson, B.C., states that the Western Canada Timber Company will start up its plant at Gerrard shortly.

The Moose Jaw Sash & Door Manufacturing Company, Limited, Moose Jaw, Sask., has been incorporated with capital stock of $30,000.

A. Fraser Company have been incorporated with head office at Vancouver, B. C., and capital stock of $25,000, to carry on business as timber merchants.

The Ohio Lumber Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $300,000, to carry on business as manufacturers of lumber, timber, shingles and lath.

Townley Bros., Limited, have been incorporated with head office at Vancouver, B. C., and capital stock of $25,000, to take over and carry on the timber business formerly carried on by Lawrence Townley or Townley Bros.

Garnet Grey Fair and Wm. McIntosh, shingle mill operators, at Salmo, B. C., have dissolved partnership by mutual consent. The business hereafter will be carried on by Garnet Grey Fair under the name of "Fair Shingle Co."

W. A. Anstie, manager of the Forest Mills of B. C., recently stated that his company's various mills were operating at one-third capacity and there was a bright prospect for their being put upon full time in the near future.

The Edgewood Lumber Company, Castlegar, B. C., has decided to open its mill. Good reports of trade activity are being received by the company and as the crop prospects are good prairie farmers are placing orders for lumber.

The Cutler Shingle Company, Limited, has been incorporated with head office at Port Coquitlam, B. C., and capital stock of $20,000, to take over the business formerly carried on by W. B. Cutler, at Port Coquitlam, B.C., known as the "Cutler Shingle Mill."

The Alberta Farmers' Co-operative Company, Limited, Lougheed Building, Calgary, Alta., Secretary, E. J. Fream, are receiving tenders for the supply of lumber necessary to erect from one to ten elevators in Alberta. Specifications may be seen at the office of the company.

C. L. Terry, Vancouver, recently purchased from the Provincial Government over 3,300,000 feet of timber situated on Huaskin Lake, near Drury Inlet. The stand of cedar is 2,500,000 feet. Prices realized were $1.00 per thousand for cedar and spruce and for other species 50 cents per thousand.

The Kennedy Lumber Company, Limited, has secured a Dominion charter to carry on business as general lumber and timber manufacturers, with head offices at Winnipeg, Man. The incorporators include R. Siderfin, J. Ledingham, W. J. Allen, J. G. Crawford, and E. F. Haffner, all of Winnipeg.

A Vancouver despatch states that the British Columbia Mills, Timber & Trading Company have received an order from the British Admiralty for 10,000,000 feet of mixed lumber. Mr. Eric Hamber, vice-president of the company, states that this will enable them to open up more of their northern camps.

Sealed tenders are being received by the Minister of Lands for British Columbia up to June 25th for the purchase of License X92, to cut 4,440,000 feet of Douglas fir, hemlock, cedar and balsam fir on Lot 45, Chancellor Channel, Thurlow Island, Range 1, Coast District. Three years will be allowed for the removal of the timber.

The Cascades Timber Company has been granted an extra-provincial license to carry on business in the province of British Columbia with provincial office at 519 Metropolitan Building, Vancouver, and Rufus H. Roys attorney for the company. The address of the head office is care of M. G. Jeffris, Janesville, wis., U. S. A. The company's capital stock is $500,000. The objects of the company are to carry on business as lumber manufacturers and merchants.

The shingle mill being erected by the Shull Shingle Company on the north arm of the Fraser River at New Westminster, B. C., is nearing completion, and the installation of the machinery is well under way. The equipment will consist of 24 upright Sumner machines and one 4-block horizontal machine. The main mill is three storeys high, the top floor being occupied by the shingle machines, the middle floor by the sorting bins and the ground floor by transportation facilities. Four large dry kilns are located some distance away from the mill.

**Portland, Ore., 1313 Northwestern Bank Bldg.**
**Seattle, Wash., 1009 White Building**

## Hardinge Watchman's Clock

70 per cent. of the lumber fires start in the yards. Is it not good business to employ a night watchman and a Hardinge clock? Stations at the end of each alley—weatherproof, tamperproof, and put up by your own men, no wiring, guaranteed by the factory for one year. Every danger point in your plant is inspected hourly every night and you have your watchman's record of his night's work.

No part of this clock is made in Germany—it is made in the United States. The clock is $39.50 and stations $4.20 each, F.O.B. Toronto. The Canadian Western Lumber Co., New Westminster, B.C., have 40 stations in their plant.

Write us.

**Lintz-Porter Co.**
27 Yonge St. Arcade,
TORONTO

## EVINRUDE

2 H.P. and 3½ H.P.

**Detachable Rowboat Motor**

The ideal motor for lumbermen, foresters and contractors.

Practical, durable, reliable.

Powerful for towing; can also be hooked right on to the scow, barge or float.

**One motor will do the work of three or four men.**

Waterproof magneto, built in the flywheel.

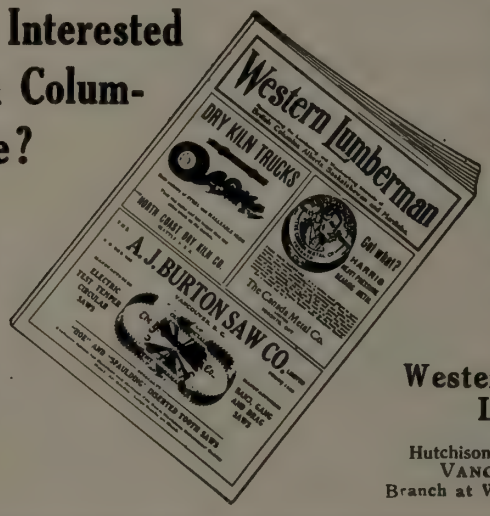
Over 35,000 in use.

Write for catalog and prices to

**MELCHIOR, ARMSTRONG & DESSAU**
116 L. Broad St., NEW YORK

## Are You Interested in British Columbia Trade?

The immensity of the Lumber Industry will within a few years make this Province the most important in the whole Dominion.



There is undoubtedly a big market for Mill Equipment of all kinds. Let us Demonstrate our Advertising service. We please others, we can please you.

# Moreau Barkers Eliminate Log Boiling

¶ Moreau Barkers save time by eliminating the boiling of logs.

¶ The Moreau Barker rosses from two to three cords per hour, taking logs 48" in length and 3" to 50" in diameter—peeling thoroughly—and evenly. It removes all knots, lumps and bark.

¶ The Moreau Barker saves money on power. It does not require more than 8 H.P. maximum for operation.

¶ The Moreau Barker only diminishes the log 18 per cent, a saving of wood from 7 to 12 per cent as compared with other machines.

¶ If you wish to make more money and do easier and better work write us for particulars.

## The Moreau Barking Machine Company, Limited

## St. Hyacinthe, Que.

## We make a Specialty of

# Conveyor Chains

## For Lumbermen

WE make them from carefully-selected iron, and every link is guaranteed ***strictly hand-made***—not the inferior machine-made.

The point is worthy of special emphasis.

We make the chains according to any dimensions desired, guarantee splendid workmanship; uniformity; dependability.

Prices are the lowest possible for the class of work we furnish, and Quality above criticism.

Let us quote for your needs.

**Send for catalogue giving estimated weights of various sizes of chain; prove test; breaking, straining and safe-working loads, and giving hints regarding the care of chain which will prolong a chain's usefulness.**

## Woodhouse Chain Works

*P.O. Box 525* TRENTON, N.J.

# "The Missing Link"

**DROP FORGED**
**FROM HIGH GRADE STEEL**

***Made in sizes 1/4" to 15/8"***

These links are the only ones which compare with the same size chain and are fully equal to it in strength. The great advantage of this is self-evident. Their use means a saving in expense and time. No other link approaches them. We also manufacture a large line of CONTRACTORS' SUPPLIES and MOTOR BOAT FITTINGS

*If a dealer, ask for our 450 page catalogue.*

**The**

## Thomas Laughlin Company

**Portland, Maine, U.S.A.**

**This engine is 13½ ins. x 18 ins. and weighs 35 tons.**

The knowledge and experience of fifty years in locomotive designing and construction is what you get in our Logging locomotives. They are specially constructed for logging operations and will stand up to the severe service in which they are expected to run. Oil or coal burning.

They are as carefully designed and built as our 200 ton locomotives. Repair parts may always be obtained on the shortest notice.

**Grey Iron Castings—any size or shape—ordinary or intricate—made promptly. New foundry, splendidly equipped. We would be pleased to quote on castings—singly or by contract. We also make drop forgings of all descriptions.**

**MAY WE SEND YOU SPECIFICATIONS?**

**Not altogether what we say but what users say**

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

**West & Peachey - Simcoe, Ont.**

# Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

# Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

**W. W. Cory,**

Deputy Minister.

Department of the Interior, Ottawa,
December 20th, 1912.

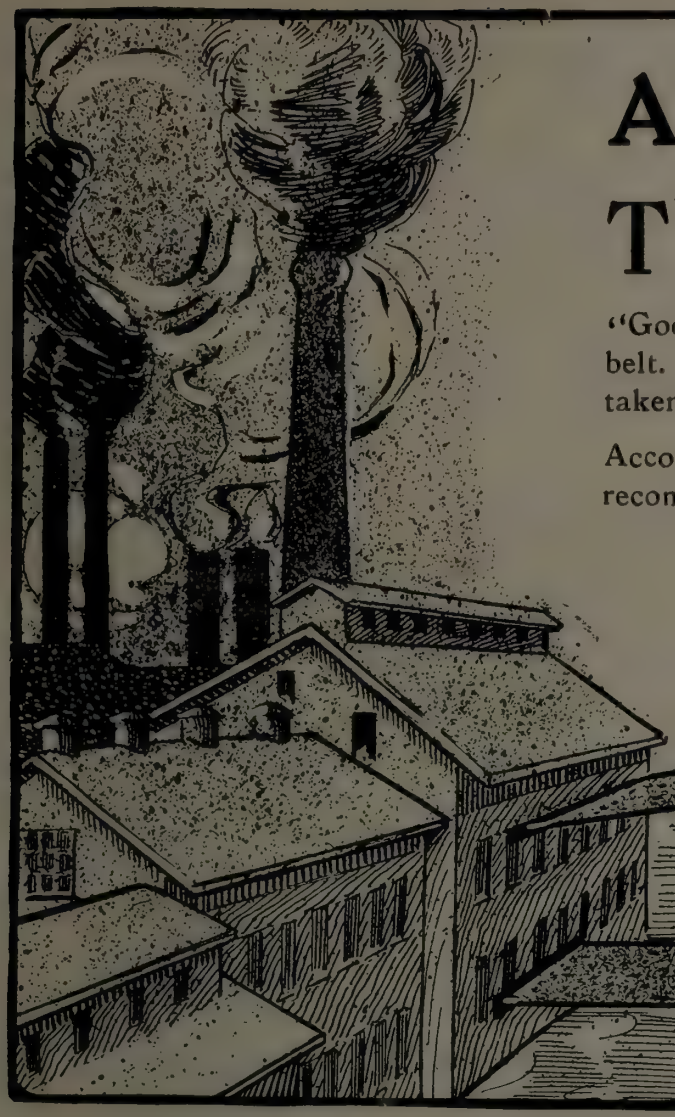
## "Wilson Bros." Flooring and Trim

"Wilson Bros." stamped on every piece of this flooring stands for Quality. Look for the name. Hardwood and Pine. **Interior Finish of All Kinds.** Also Hardwood Veneer Doors to detail. We are equipped to fill large or small orders on short notice. Write us for prices.

**Wilson Bros., Limited - Collingwood, Ont.**



# A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent. than any other belt. They are made from skilfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run we recommend "Extra," "Standard" or "Acme Waterproof' Belts

***Send for further particulars and prices.***

# Why An Aloxite Saw Gumming Wheel Cuts Cool

ALOXITE is tough—it has just the proper temper to keep the wheel with a free cutting face.—The wheels are of an open or porous nature, thus allowing the free action of the grain. —A close bonded wheel drags—creates friction—friction means heat. Aloxite wheels cut cool, free, fast—they don't fill—they produce no unnecessary friction—they work without rasp or screech—hold their shape—show long life.

# The Power of "A Want Ad."

When you have something to sell that another is likely to want, or if you want something, a sure way to get in touch with your party is through a "want ad." This class of advertising the world over is a rapid and positive means of finding your man.

If you have any wants in the lumber business the quickest and most inexpensive way to satisfy them is by advertising in the

**Wanted and For Sale Department** of the Canada Lumberman and Woodworker.

Twice a month "the paper with the green cover" brings together buyers and sellers of lumber and machinery from all the principal lumbering centres of Canada and the United States. By covering this wide though specialized field, waste circulation for advertisers has been eliminated.

For quick and satisfactory results, get your advertisement in the **Wanted and For Sale Department** of the

**Canada Lumberman & Wood Worker**

# Labor Saved Is Time Saved

When to this is added increased durability we have the economy that naturally results from larger output and long service.

These are some of the strong points in favor of

# Disston Cross-Cut Saws

They are ground to a true taper all the way from cutting edge to an extra thin back. Being ground on lines that conform exactly to the breast of the saw, the blade is absolutely uniform in thickness throughout the entire length of the cutting edge. This special method of grinding gives the maximum amount of clearance with the minimum amount of set, without sacrificing elasticity and stiffness. You know that all these points are good points, and substantiate our claim that Disston Cross-cut saws are unexcelled.

You will find a lot of valuable information in our Cross-Cut Saw Booklet. Sent free on request.

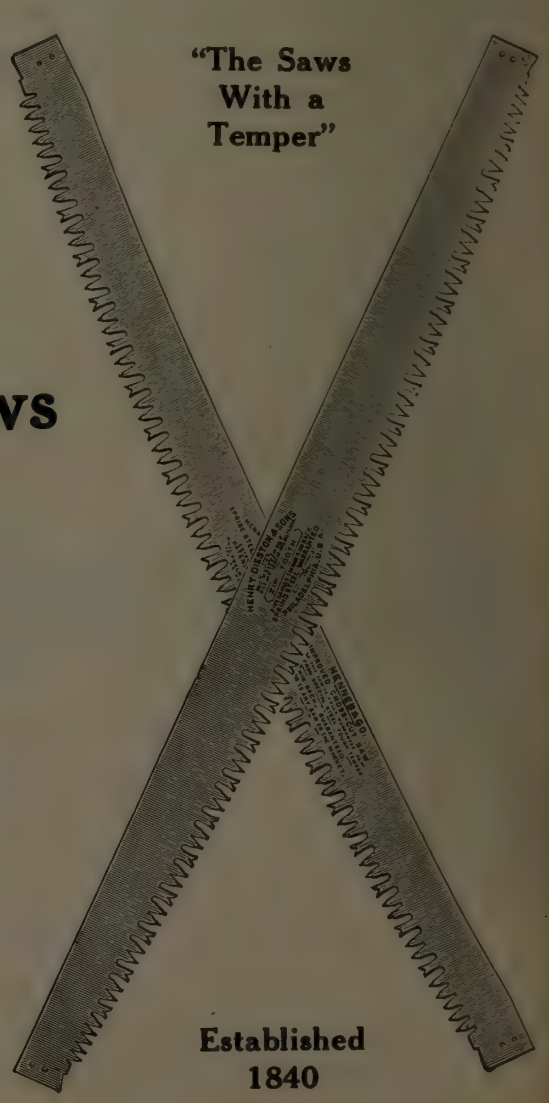
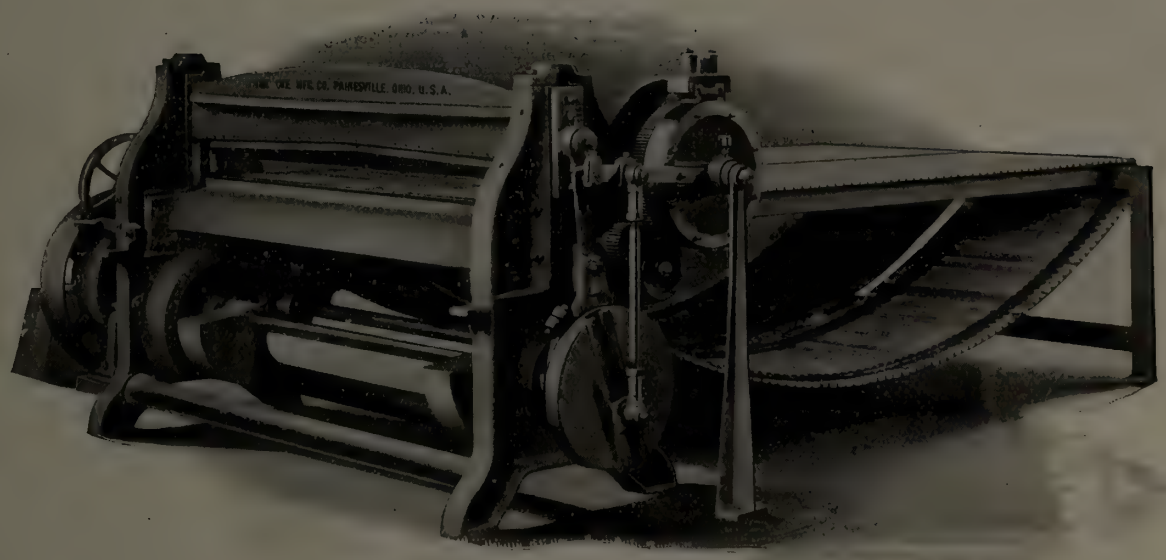
"The Saws With a Temper"



Established 1840

Veneer Machinery

# A New Improved Veneer Clipper



The illustration shows our new improved type "E" veneer clipper. The machine is sturdily designed with great strength and freedom from complicated parts. It will cut a thick bed of veneers and leave every sheet with a clean, smooth, square edge

For crates and basket work this new clipper fitted with the automatic feed attachment is indespensable. The machines are furnished with a top roll which holds the stock firmly to the table in feeding under knife, thus preventing the stock from slipping.

The Automatic feature is simple, durable, positive in its working and entirely different and infinitely superior to any other kind on the market.

The clipper is built in the following sizes, 36, 42, 52, 64, 76, 88, 100 and 120 inches.

*Write us for catalogues of this and our other veneer machines.*

## The Coe Manufacturing Company

### PAINESVILLE, OHIO, U.S.A.

*Established 1850*

***The oldest and largest manufacturers of complete veneer equipment in the world.***

*The Mark* THE E. LONG MANUFACTURING CO. SAW MILL MACHINERY ORILLIA, CANADA *of Quality*

# 3 Saw Improved Lath Bolter

## Points Worthy of Notice

Main frame made in one piece. 2 lower feed rollers 5″ diameter and **power driven.**

2 upper pressure rollers both **power driven.**

Front pressure roller raises towards the saws, and being power driven prevents bolts from flying back out of the machine.
Bolts cannot stick.

**At the price we sell this machine it has no competitor.**

# Long's Quality Lath Bolters

## 4 Saw Lath Bolter

A machine for mills of large cutting capacity

Please notice

this machine has—Three Mandrel bearings, the outer one being easliy removed for taking off saws for filing.

Four lower feed rollers, all **power driven.**
Two top pressure rollers, **power driven.**
Bolts cannot stick or fly back.

# Waterous Edgers

## Every Size—Take Your Choice

### *Light Champion Edger*

Saw space—30½ in., carries 18-in. saws; will take cants and lumber up to 5 in. thick. Built in two sizes:—two saws—1 movable, 1 stationary; three saws—2 movable, 1 stationary. The best edger for light and portable mills on the market.

**Catalogue 115**

### *New Champion Edger*

In three sizes—40-in., 48-in. and 52-in. saw opening. Carries 22-in. saws, will take stock up to 6 in. thick. **Our automatic guide gauge is a feature**—no other edger has it.

**Catalogue 113**

### *Big Champion and Combination Edger*

**The heavy edger for heavy duty.** Built in seven sizes—48-in., 54-in., 60-in., 66-in., 72-in., 84-in. and 96-in. saw space. Carries 26-in. saws, takes cants up to 8-in. thick and will handle them without trouble. **Combination Edger** has cluster section 18½ in. wide and will take as many as 12 saws. Just the thing for the mill that has lots of small logs but not enough to warrant the installation of a gang.

**Catalogue 1011**

# Reduce Your Belting Expense
and
# Beware of Imitations

"CAMEL HAIR" "CAMEL" BRAND BELTING — TRADE MARK REG.

**Reasons Why**
**THE "CAMEL HAIR" BELTING**
**As a Power Transmitter is Cheapest**

**BECAUSE!** It lasts longer than any other belt on the market.
**BECAUSE!** It slips just one-half that of any other belting.
**BECAUSE!** It will run equally well in damp, wet or a dry atmosphere.
**BECAUSE!** It is less affected by acid fumes and high temperatures than any other belting.
**BECAUSE!** It is uniform in thickness and runs true.
**BECAUSE!** Of its great strength—almost twice that of best oak tanned double leather.
**BECAUSE!** It requires much less attention than other styles of belting.
**BECAUSE!** The stretch comes out quickly and after taking up once or twice (according to load and nature of run) requires little or no more attention.
**BECAUSE!** It transmits more power than any other belting.

**We also manufacture**
**"Black-Duck"**
**Stitched Canvas Belting**
**for**
**trasmission, elevating and conveying.**

**Red Stitched Canvass Belting for all purposes.**

**"Insurance" Brand Linen Fire Hose with Underwriters' labels.**
